More Sayings of Jesus

THEY who are with me have not understood me.—*Acta Petri*

The Lord knoweth them that are His, both those that are near and those that are far off.

The disciples thus spake unto Jesus: "Thou art a key to every man, and the one who shutteth to every man."—*Codes Askeu*

This is evidence of the fact that Jesus was a Master of Wisdom who had esoteric teachings such as could be communicated only to those able to receive them and who spoke to others in veiled and symbolic language. The same is told in the canonical Gospels. It also gives part of the reason why his teachings

Civilization and Capital Punishment

THE Society of Friends of Philadelphia has issued a most useful little pamphlet briefly summarizing some of the arguments against capital punishment, but giving most space to a demonstration that it does not deter. This is effected by statistics gathered from many countries which have tried, or are trying, the results of the abolition.

But first, the pamphlet answers the contention that its abolition would lead to an increase of lynchings.

"If this opinion be correct," it says, quoting from Charles Galbreath,

as numerous writers aver, we shall, of course, find the majority of lynchings in the States (of our own country) that have abolished the death penalty. What are the facts? In the last fifteen years two of these States have not had a single lynching. Of the others, one has had two lynchings and the other four, while Georgia, the State that leads all others, with one hundred and seventy-two executions, also

there were eighty-seven capital sentences. "In other words, with no executions the number of murder cases had decreased by nearly forty per cent."

France: No deductions can be drawn. The *New York Nation*, commenting on the recent refusal of the French Chamber to abolish capital punishment — by a vote of 330 to 221 — remarks that "the period of years taken to show the increase of crime is altogether too short."

Holland: Capital punishment was abolished in 1870. The Dutch Minister of Justice says that: "The statistics demonstrate that murders in proportion to the population are diminishing."

Italy: There has been no death sentence since the accession of King Humbert. In the *International*, the Italian procureur-général asserts that the number of serious crimes is decreasing.

came to be converted into a dogmatic creed after his departure. According to the Gospel accounts, if we take them literally, these disciples deserted him in the time of trial, but came out as strong champions of some system which they preached in his name after the trials were over. Moreover there seems to have been a Pauline school and a Petrine school, teaching differently from each other. The last quotation has been interpreted to mean that Jesus shuts the doors of other beliefs, but it more probably refers to the fact that a Master is doorkeeper to the Mysteries, both as the opener to those who are ready and as shutter to those who are not. T.

PUBLIC Theosophical Meetings are conducted every Sunday night in San Diego at 8:15 at the Isis Theater, by students of Lomaland assisted by children of the Râja Yoga School. Theosophical subjects pertaining to all departments of thought and all conditions of life are presented. Excellent music is rendered by students of the Isis Conservatory of Music of Lomaland, and Theosophical literature may be purchased.

stands second, with two hundred and thirty-seven lynchings. Texas follows with one hundred and forty executions and one hundred and eighty-three lynchings. Alabama almost duplicates the record, with one hundred and nineteen executions and two hundred and six lynchings; while Mississippi, which falls a little behind, with ninety-seven executions, leads all the States with two hundred and forty-nine lynchings. . . . Almost without exception, executions and lynchings go hand in hand. (Written in 1906.)

If lynchings are considered as index of imperfect civilization and as corresponding, in relative numbers, with the degree of its imperfection: then, since they go hand in hand with judicial executions, the persistence of the latter in any State or country is another index of the same. What is the experience of the States and countries which have taken the step in advance?

Belgium: "The Minister of Justice stated in 1890, that during the decade 1846-1855, when executions were carried out, there were one hundred and forty-three capital sentences." During the next decade, with no executions,

Portugal: "Capital punishment," says the pamphlet, "was abolished in 1867. Homicides are officially stated to have materially decreased since abolition," being in 1880 one half of what they were before.

In *Switzerland* there have been no executions since 1879, though any of the Cantons may re-introduce it at their option.

In *England* nearly half the death sentences passed are commuted. In *Austria*, between 1870 and 1879, seven hundred and ninety out of eight hundred and six were commuted. In *Sweden*, twenty-nine out of thirty-two. In *Norway*, eleven out of fourteen. In *Denmark*, ninety-three out of ninety-four. In *Bavaria*, two hundred and forty-two out of two hundred and forty-nine. In *North Germany*, between 1869 and 1878, four hundred and eighty-three out of four hundred and eighty-four, the one convict executed in this case being not actually guilty of murder, but only of the attempt at it. He was in fact the man who attempted the Kaiser's life.

United States: Each State has its own Criminal Code. Five have abolished the Death Penalty. The Attorney-Generals of these States said (in 1907) that there had been no increase in the number of mur-

ders as a result of abolition, and expressed themselves as satisfied with the existing condition of things in their respective States.

Maine has had an unusual experience. Prior to 1876 the death penalty was partially abolished. In that year it was abolished altogether. In 1883 it was re-established. Did the dread penalty stay the uplifted homicidal hand? No. The very next year the number of homicides rose from four to thirteen. The two years following showed eight and five cases respectively. The Governor declared in his message that the re-enactment of the death penalty had failed utterly as a restraining influence. In 1887 it was again abolished, in the language of an official of that State, "Never to be enacted again." The number of homicides for the three years preceding the enactment of the death penalty was eighteen. The number for three years under the death penalty was twenty-six. For 1887 and 1888 there are no reports. For the three years following after the abolition of the death penalty the number dropped again to eighteen. Nor is this all. Statistics are available from the State, covering a period from 1860 to 1904, with the exception of the years 1887 and 1888, making in all forty-three years. In twenty years, covering the earlier portion of the period while under capital punishment, the State had, according to judicial records, two hundred and fifty-three homicides. For the remaining twenty-three years, without capital punishment and with a larger population, the State had only one hundred and sixty-two homicides. With capital punishment the homicide trials averaged annually a little less than thirteen. Without capital punishment the average was seven. If the population is taken into account, there were in Maine just about twice as many murders with the death penalty as there have been without it.

So stands the case in the civilized world at present. May it not be said that at best capital punishment is useless as a deterrent? The pamphlet from which we have quoted presents the usual positive arguments in an unusually clear and quiet manner, to which Theosophy can add several more. But mainly this one: that the intense and morbid strain of the convicted man's consciousness before and after his execution, long after, constitutes it a center of virulently morbid moral infection, spreading its emanations far around among the minds of the people, energizing latent pictures of crime and the emotional disturbances that lead to it, and depressing the vitality of every sensitive nature. In other words, capital punishment continues to create what it is intended to cure.

A Mysterious Visitor from Afar

THE comet (*Morehouse*, C 1908) which has just passed out of sight behind the sun, was an object of far greater interest than the larger and brighter comet visible in 1907 (*Daniel*), owing to the unusual behavior of its tail, which provided material for unlimited speculation among astronomers.

Instead of conducting itself as an orderly comet should, and gradually increasing in size and brightness as it approached the sun, this erratic specimen has been characterized by rapid and inexplicable changes and outbursts.

Several times complete transformations took place within a few hours, entirely changing the appearance of the comet. On Sept. 30 the comet looked like a comet, with a bright nucleus and a long fan-like tail, but in a short time the tail had practically disappeared. A little later a new tail appeared, which at one time was quite separated from the head, and on Oct. 15 a curious secondary tail was developed some distance from the head. Traces of a spiral motion in the tail were detected on Nov. 18.

The cause of the transformations is utterly

unknown, but hope is expressed that the 239 splendid photographs taken by Professor Barnard at the Yerkes observatory will throw some light upon it.

The present accepted theory of comets' tails is partly that the head evaporates quantities of extremely minute particles of matter, so minute that the pressure of sunlight overpowers the attraction of gravity and pushes them away into the depths of space. An electric repulsion is also suspected. This extraordinary theory explains the curious fact that the tails are always directed away from the sun, but it gives no light as to *modus operandi* of the production of the minute particles from the nucleus in the first place.

Comet Morehouse was nearest to us on Nov. 3, and will again be visible in the spring but only in the southern hemisphere. It was well seen by observers at the Theosophical Headquarters at Point Loma. STUDENT

The Lessons of a Tooth

PROFESSOR BOULE, of the Paris Natural History Museum, has done a nice little bit of reasoning, resting upon a single tooth. The tooth is that of an elephant; but he is dead. In fact he passed away sometime early in the Quaternary epoch. The island of Delos, one of the Cyclades, in the Aegean Sea, was being excavated for archaeological reasons. During this process, M. Homolle thought he would sink a shaft on his own account and was rewarded by this solitary and unobtrusive tooth. The rest of the elephant was not in evidence. But when alive he must have dwelt around there somewhere. So must his friends. But Delos is only 3 miles long by one-sixth wide. Consequently the island was then a part of the main continent, which, since his death, must have gotten its southern fringe so torn up over there in the eastern Mediterranean.

Perhaps there was once no Mediterranean; we know it was bridged at Gibraltar. Considering the great civilizations all round its brim, one might suspect that the remains of one greater than any of them may lie hidden at the bottom of its basin. STUDENT

Clipped from the Press

ONE has been wondering a little how the Romanist church at Riesa has been getting on. It may or may not be generally remembered that last February the following irresistible notice was widely published in Saxony:

We beg to call attention to the fact that during the month of March a solemn mass will be read every day in Riesa for the special benefit of those helping the church in that place. These masses have been instituted by the building committee and enable anyone to obtain the blessings and grace of the whole thirty-one—five high masses included, for one mark (25 cents). The money will be applied to the building fund. There must be those who have special wishes for wife, family, or relatives or who suffer from seasickness or from pecuniary distress. These masses are further applicable to the souls of the dead. Here is indeed an opportunity to obtain a rich store of grace at slight expense since one mass usually costs more than the whole thirty-one.

Respectfully,
CHURCH BUILDING COMMITTEE,
Riesa on Elbe.

This clipping is cut from *The Converted Catholic*, Nov. 1908. H. C.

New Discovery by Physicians

AT a meeting of Congregational ministers to discuss the Emmanuel movement, a noted M. D. addressed the audience from a doctor's standpoint. As reported, he made the following remarkable statement:

The physicians themselves were the first to discover that there must be a personality distinct from the brain, and that the brain by itself could not originate thought.

Words cannot be found to describe the audacity of this statement about the physicians. Theosophy has always had to fight for that very point against many physicians, by whom it has been bitterly assailed therefor. Now we find a physician asserting that physicians were the first to discover this fact about which Theosophy has been fighting! "Even physicians have at last discovered it," would be a better way of stating the actual case; but even that would not be true of physicians as a body.

We've all got to be idealists. Materialism hasn't a leg to stand on,

continued the speaker, quoting another doctor. Another sign of the times. T.

Does Abstinence Cause Worse Evils?

AN influential authority, whose views are discussed in the press, either lends or seems to lend his support to the theory that total abstinence produces worse evils than it stops, and that therefore moderation should be the aim and not total abstinence. Here is confusion of thought; for the writer, or the critic who quotes him, speaks of abstinence and prohibition alternately and indifferently, as if they were the same thing; and thus an argument against prohibition is made to pass for an argument against total abstinence.

The question whether prohibition is or is not a wise means for securing temperance need not detain us at present. We are concerned in maintaining that total abstinence does not produce worse evils than it stops. The real question about prohibition is whether or not it can produce abstinence. If it cannot produce abstinence, then, in declaring prohibition to be an evil, we declare abstinence to be a good; and, admitting abstinence to be a good, the question becomes how to secure it by some other means than prohibition.

It may or may not be true that prohibition will lead to worse forms of intemperance, such as secret debauchery and drug-taking; but it is obviously not true that total abstinence will do this. Even though total abstinence may at first cause the precipitation of a few acute symptoms, such an outcome is only what is always to be expected from sudden attempts at reform; and, so far from being an index of failure, it is a herald of success. These effects are only sporadic and temporary and should never deter us in our determination to go on. The devil always tears his victim when he is ejected. To allow him a permanent tenancy for fear of the consequences of firm conduct is to make terms with him. T.

A STURDY old lady has just died in county Limerick, Ireland, after reaching the unusual age of 118 years. She lived to see her grandchildren's grand-children. She was a firm believer in the cold water bath and had one every morning up to last August. J.

Art Music Literature and the Drama

The Poetic Drama and Real Life

THE following appears in today's paper:

The poetic drama seems to have fallen on evil days. Perhaps this indicates a tendency which will everywhere more and more prevail.

Already our modern city civilization is something strangely and in many ways essentially different from the civilization of even two generations ago, and different from any civilization the world has ever had. It is certain that the vast majority of playgoers will never be interested in scenes, in manners, or in characters, remote from their everyday, ordinary life. Therefore, apart from mere amusement and nonsense, we expect that most successful plays of coming time will be those that swiftly and realistically snapshot current events, personages, and even slang of the passing hour.

Does this imply or even allow a great school of national drama? Perhaps not. Yet after all, the keenest, not the greatest or highest, but the keenest pleasure any work of art can give is the taste of real life.

The Theosophist will at once ask "But what does the writer mean by 'the poetic drama,' and what by 'real life'?" If by "poetic drama" is meant a sentimental portrayal of fanciful and wholly fictional notions, such as budding writers are sometimes guilty of producing, then we agree that it is doomed. If the term is meant to include those great dramas and dramatic poems which give us glimpses of the soul in stress and in joy and which strike below the surface to that rich vein where character lies awaiting the magician's touch to reveal it—those mighty heart-songs of the ages, ranging from *Alcestis* and *The Eumenides* to Shakespeare's *Lear*, *Hamlet*, and *The Tempest*, even to Browning's *In a Balcony*, a poem essentially dramatic—then we must disagree. Such as these may not be on the boards of every cheap theater nor may they be vociferously demanded by *hoi polloi*, but they are no more "doomed" than the sun is "doomed" after sunset. A period of hours will intervene during which no sun will shine, but we may depend upon seeing it as gloriously regnant as ever at the following dawn, and gratefully welcomed by all who have had enough of night.

And so with all dramas which clothe with the finer poetic garment the great truths of destiny and of life. They are today obscured, it is true, but considering the lowness of general ideals, the almost universal ignorance of soul-life, or of any life in its higher aspects, considering the tendency toward the cheap and the sensational and the fact that the theater is regarded by the majority as an amusement-hall merely, a sort of "merry-go-round" and not at all as an educational center, considering that the urging force back of dramatists as well as impresarios is generally the

dollar—considering all these facts, would it not be comment most unkind if the true poetic drama were stated to be immensely popular? Those who know life would look upon such an avowal with suspicion, and justly.

The present age, as the Teachers of Theosophy have so often pointed out, is one of transition, of over-turning and general plowing-up. People are driven by the almost universal inner urge, felt but almost never understood, to get out of old ruts. But what one shall get into instead depends upon the person, upon his innate qualities, good or bad, his education, the force of his environment, the purity or

commentary in proof of the age's ideals. Poe received ten dollars for *The Raven*. A certain writer and alleged dramatist, whose productions are so filled with slang that the average American can understand most of them only by context and "guess" while an English audience which witnessed one of his plays last year asked to have it translated (!)—this writer made an independent fortune in less than three years from such writings as these alone. Is this sort of thing "the taste of real life"? H. P. Blavatsky says, in one of her marvelous writings (*The Key to Theosophy*, page 175):

The clue lies in the double consciousness of our mind, and also in the dual nature of the mental "principle." There is a spiritual consciousness—the *mānasic* mind illumined by the light of *Buddhi*—which subjectively perceives abstractions, and a sentient consciousness—the lower *mānasic* light—inseparable from our physical brain and senses. The latter consciousness is held in subjection by the brain and physical senses and, being in its turn equally dependent on them, must of course fade out and finally die with the disappearance of the brain and physical senses. It is only the spiritual consciousness, whose root lies in eternity, which survives and lives forever, and may therefore be regarded as immortal. Everything else belongs to passing illusions. . . .

What is life? A bundle of the most varied experiences, of daily changing ideas, emotions and opinions. In our youth we are often enthusiastically devoted to an ideal, to some hero or heroine whom we try to follow and revive; a few years later, when the freshness of our youthful feelings has faded out and sobered down, we are the first to laugh at our fancies. . . . The *inner* man is the same; the outward living personality is completely transformed and changed.

And some years earlier she wrote in *Isis Unveiled* (vol. II, p. 593):

From the remotest antiquity mankind as a whole have always been convinced of the existence of a personal spiritual entity within the personal physical man. . . . The closer the union the more serene man's destiny, the less dangerous the external conditions.

Could anything be plainer? The man is not the coat he wears. The real self is not that bundle of quarreling personal emotions, propensities towards personal gratification, selfish tendencies, whims and crochets which the modern-day slang-ridden "literature" of the drama depicts. Real life is something besides the panorama of outward trivialities, and the drama which contents itself with depicting these, "snap-shotting" them for the passing entertainment of those who go to the theater only to get away from themselves, is the drama that is "doomed" to pass, along with all the other cheap sensationalisms of the day. The true and higher drama, that gives us light and philosophy, is only now coming into its own. STUDENT

A ROMAN HEAD

ORIGINAL IN ONE OF THE NATIONAL MUSEUMS AT ROME

otherwise of his motives. So some rush into this or that cult, others take up one of the numerous expressions of the faddism of the age, still others try to forget themselves—and *do* lose themselves—in light and fleeting pleasures, among which are those numberless so-called "dramas," which "swiftly and realistically snapshot current events, personages, and even slang of the passing hour" and which, we are told, give us "the taste of real life." (!)

Which brings us to the second question, "What is real life?" and also suggests silent

THREE souls stood ready once again to leave the upper world and enter upon another cycle of endeavor. It was a solemn moment. They looked back into the eternity of their own existences. Free at that instant from the temptations that had once assailed them; from the clouds that had once enveloped them; breathing an atmosphere of purity and electric clearness, they saw the truth regarding themselves. They saw where they had done ill, where they had done well. One by one they perceived the golden opportunities they had passed by lightly. They saw their own selfishness which had too often blocked their way; their vanity, which had so often obscured the truth; their indolence, which had held them back; their carelessness and ambition which had hurt so many others. In that clear light in which they then stood the past was unveiled in sharp lines and true colors. With the same pure vision they looked forward. They saw the meaning for them of the surroundings they were about to enter. They understood well that the place they had reached was one to which they had brought themselves, and that it lay with them to wield the forces they would encounter for weal or woe. They knew that all the experiences before them, whatever might be the seeming, had but one purpose for them and that their success or failure in the coming tests would rest upon their power to hold this purpose in their hearts. And as they gazed with intense earnestness on the life which lay before them, the Angel of Destiny appeared and touched them with his rod. "Your hour has come," he said, "be strong. It is my part to lead you thither, as it will be again to meet you when next you return this way. You go forth to work out in action the powers you have already gained; to germinate the seeds you have already planted; to weave in symbols another design in the book of your lives. The pattern and the threads will be of your own making. But only the threads spun from the matrix you carry from this world will be living

The Mingled Threads of Life

threads, only these can endure; work with them and you will leave in the lower world a beacon light, an inspiration to your fellow workers. Work with those which are born in the lower world, and no light, no help can come to them. Go forth, and may the impress of this moment never leave you. When you return again from your journey I shall be forced with my magic rod to touch the patterns you have woven, and lo! their nature will at once appear."

The Angel left them and the three pilgrims entered into the valley of the shadow of life. Oblivion swept over them and in the gray dawn they emerged into the material world and found themselves face to face with the Great Illusion. The only memories they carried with them were their impulses, their characters, and as in a dream they moved about. The breath of heaven was yet upon them and in the sweetness and freshness of the morning air they bathed. New sights and sounds attracted their senses. The mystery of life entranced them. Of flower and leaf and bird they asked its secret, yet no sound reached their ears save a confused and distant murmur of sweetness whose music seemed to die if they but stirred a breath. From sunshine to shadow they danced, from blossom to pebble, surprised, bewildered, charmed, and spinning all unconsciously the threads of life. Slowly, but deeper and deeper the subtle enchantment invaded them. The past faded yet fainter and the dream became to them a reality.

They now became fully absorbed in their surroundings and with intense activity began spinning their threads of myriad colors and textures. They were possessed with desires to weave designs worthy of their powers, yet their purpose grew dim, and, save in the case of one of them, was soon utterly forgotten. The design in itself and the admiration it would cause became for the second the goal

of existence; while for the third, the effort of weaving often seemed too great a burden to endure. Spinning she could not avoid, as it was a necessary condition of living in the world of matter. Yet she spun carelessly, heedless of the threads she chose, and as she rarely took the pains to weave, the threads gathered in tangles about her feet, and held her as in a net. Bitterly she complained of the restrictions she began to feel, of the obstacles that impeded her wanderings. At times, as she sensed the cause, she sought to separate the tangled threads, and to weave them into some pattern which flitted through her brain; but she soon grew weary of the irksome task and relapsed into an indolence which encumbered her yet further.

The first, who still dimly felt the purpose of her life, resolved to weave as best she could a pattern in harmony with it. And ere the shadows fell each night she looked to see whether in her weaving she had done aught to thwart this purpose and aught to further it. And by degrees her vision grew clearer, and that which the Great Illusion had dimmed for her at first, became more and more unveiled. She looked through the dazzling objects which at first had held the focus of her eyes, and to her they were transparent; and she saw painted on the screen of time the pattern which was planned for her and which she must bring down to earth. And a deep joy filled her soul, and in patience, contentment and persistence she wove from day to day.

But her task was not a brilliant one. Quiet were her colors and simple the design, and few there were who knew its value. The many who passed her by turned not their heads a second time to see her work. And only a very few of the busy throng knew or cared what she was doing.

But with the second it was not so. Quickly she began to feel her power to spin threads of brilliant color, and to weave them into a design such as rarely could be seen. And she worked with untiring zeal. Little by little,

as the pattern began to be displayed, the passers-by gathered round it to wonder and admire. Larger and larger grew the crowd; more dazzling, more beautiful, more irresistibly charming grew the design. Those who were under its spell said it rivalled the sunsets in glory; the gentle beauty of a rural scene in sweetness; the fragrance of a spring morning in freshness; the opalescent tints of a fair sunrise in delicacy; and the grandeur of a primeval forest in majesty. Many who gathered round this fair creation forgot entirely their own patterns they had to weave, and passed the days in worshipping this. Many others, lost in envy at such splendor, sought to fashion something like it. Their own designs, which were often well begun and full of promise, they cast aside and tried to break their threads and start anew. But as their threads had not been made for such a pattern they only spoiled their own and could succeed in nothing else.

And the weaver continued to weave, mingling her threads with such subtle skill that none could say which were the living ones and which were not, though to the enraptured multitude they seemed to be all alive.

Time passed. And for the three souls who had entered the world together the hour struck. The first was not disturbed at the summons, but the third was overcome with regrets. "How have I let slip these golden moments which are now behind me," she cried. "Would that they were mine again." The second rebelled at the interruption. "I," she exclaimed, "I who know how to weave so well, whose work is of such magnitude! must I obey this call!"

And the distracted and awestruck multitude complained that one of such importance should be asked to go when so many lesser ones would not be missed.

But events moved forward as if all these little cries had not been uttered. The Angel of Destiny appeared before them.

He looked with pity upon the third, bringing with her only patches of designs, and all caught in the tangled threads of her own making. He touched them with his magic rod and the most of them vanished from sight. "I have liberated you once more," he said, "but not forever. When again you come to earth these will form once more, and you, you only, must sometime disentangle them." And knowing this was true she made no answer. But covered with remorse she stooped to gather the few living threads which clung about her, and departed.

Upon the second he gazed in stern silence. Then lifted his rod and touched with it the wondrous design which she had brought him, when, horror to behold, all its beauty fled. The most brilliant threads became charred and dirty. Large patches here and there decayed and fell away. Many threads turned into ashes and in powder disappeared. Ere long, the glittering, gorgeous picture was transformed into a ruined heap of desolation. Over its surface stretched the living threads which had held the whole together, though heretofore concealed.

The Soul looked upon the scene of destruction with a heart rent with despair. Stooping, she gathered up the living threads and departed.

And now the Angel turned to the first Soul,

who stood, all unnoticed, with the modest picture which she brought.

He lifted his rod and touched it as he had the other. And lo! a marvel was wrought. The picture began to glow with life. An exquisite harmony of color played over its surface. A luminous ether enveloped it. A soul began to shine through its form, shedding all about it rays of love, compassion, and help.

Turning to the Soul beside him the Angel of Destiny said, "Depart in peace. Your work will remain in the world of mortals, an inspiration to all who follow you."

And in a cloud of light she vanished.

STUDENT

Joan of Arc—Saint

NOT many months ago the Freemasons of Paris placed on the statue of Joan of Arc a wreath bearing the inscription, "To Joan of Arc, whom the Church burnt." A group of Romanists retorted with another wreath, this one bearing the words, "To Joan of Arc, whom the Church has the courage to canonize."

So far the French government has prevented the ecclesiastical authorities from having any official part in the public festivities celebrated in the Maid's honor in Orléans, annually, and all detachments of the French army are required to present arms when passing her birth-place in Domrémy. But the ecclesiastical battle as to Joan of Arc's saintship, which has been waged for so many years, is at last over, and, as a writer in the CENTURY PATH some time since remarked would probably be the case, she is to be officially canonized at Eastertide by the Pope, his court, cardinals and bishops present, the ceremony to be lengthy and imposing. When it is over Joan of Arc's name will have been officially inscribed in the "catalog of saints" and a decree will go forth commanding that her memory be devoutly kept by the Church.

The list of things required to be proven to the Vatican before canonization could take place makes illuminating reading side by side with the very opposite things that were proven (!) — to the satisfaction of the Church — in order to have her burnt. They are, first, that she never told a lie; second, that she was absolutely unselfish and without one taint upon her personal character; third, that she performed at least one miracle through faith in God.

Joan of Arc was burnt by the same Church, on May 3, 1431, this young girl of nineteen, as a heretic and sorcerer. Its votaries have been taught that the Church was infallible. What conclusions are likely to be drawn now?

So much has been written about Joan of Arc, so numberless have been the controversies about her ever since the first court of rehabilitation held its sittings and preserved for posterity priceless depositions of eye-witnesses, among other valuable testimony, that there would seem little more remains to be said. Yet the Theosophist looks at matters from a deeper standpoint than the unphilosophic thinker, or the thinker whose conclusions have only a false philosophy to take root in. The reflection forces itself upon one: what greater things might not this unparalleled warrior have done for humanity had she never been within the pale of the Church at all, to be hampered by its theological limitations, crucified, and

continually hindered in her work by its "ministers." Even had she passed out of life at the age she did, how much greater might have been her work but for the continual interference of priests and bishops, now holding back one enterprise until they could send an ecclesiastical "court" to Domrémy to ascertain whether or not Joan had spent a fairly creditable girlhood; again hindering something else; finally wearing her out, body and almost soul, by that last "trial," the most infamous in history?

We have only to look back at the lives of the really great women workers for human brotherhood in the past to get a faint glimpse of what it would have meant to the world had they been born without the pale of the Church. To be sure, in the Dark Ages of which we speak, death would have been the lot of most of them, sooner or later, as it was of Hypatia. Yet would it not have meant more to the world had these great souls been granted the boon of even a much shorter time than was their lot, for open unhindered work? Think of the active, actual constructive work they might have done! Think of the inner, deeper knowledge they might have given to their followers, the few!

Read the records of the life of Saint Birgitta of Sweden, born in the Church, a worker within it so far as outer forms went, but really one of its most discouraging problems. She was bent upon reforming ecclesiastical abuses, and reform many she did until the convent she founded in Sweden became known as a center of light throughout Europe. But at what bitter, what heavy cost! Hindered, hampered, annoyed, held back on every hand by the ecclesiastics in power, all that she did for the cleansing of the Church was done *in spite of it*.

Even more pathetic is the record of the struggles of Saint Teresa. And yet we cannot blame the Church for accounting a nuisance a young nun who spent her time writing letters to parents advising them "to keep their daughters at home or marry them to the poorest man rather than let them enter convent life," which she characterized as "the straight road to hell." Yet she herself, pure, devoted soul, was powerless to break away, and so her reformatory zeal had to spend itself in effort nine-tenths wasted, and crucifixion unspeakable for the whole of her unselfish life. What might she not have done for humanity—so pitifully needful of help in the Spain of her day—had ecclesiastical stumbling-blocks not been put in her path nor ecclesiastical dogmas fastened within her gifted brain! And there are others, so many others, of whom the same might be said. History throws a strangely revealing light upon the causes of earth's distracting and sorrow-fraught conditions, when read from the viewpoint of Theosophy.

Today conditions have so far altered that the chosen Messengers of Light can find a place to live in, a place to work in, that is not horizoned by the dicta of religionists. They may be persecuted, reviled — they are, and will be probably for an age or two yet — but they stand superb, aloof, and free. The Light they bear does not reach those who stumble along the path through a deadening screen or two of dogma, but clear, pure, direct. If so much has been gained for these great souls since Joan of Arc lived, what of the future? H.

THE CHRISTMAS TREE AT THE RAJA YOGA ACADEMY, POINT LOMA
SANTA CLAUS' HELPERS DISPENSING THE GIFTS

The Shining Jewels

ONE evening, as I stood in the door of the rude dwelling where I had lived long years, gazing with satisfied admiration at the precious object I held in my hand, my attention was withdrawn and became fastened upon a blazing light far off over a great hill. With sudden decision I closed the door of my house, clasped my jewel close to my heart, and started toward that light.

"What is, what can be, this wonder?" I asked, and the reply came as though my own heart had spoken:

"It is the shining of the jewels of the Temple."

"Whence came such flashing jewels?"

"They were borne thither, one by one, by such as you, carrying so tenderly now that with which you have been entrusted."

"My little jewel gleams but weakly. Yonder is a perfect blaze of glory."

"The dullness of your jewel is due to your lack of wisdom. Were you wise in your trust it would be shining also."

"No one knows better than I the needs of my own, or the nature of that which has been mine for ages. No one could so love it."

"Foolish fond! There are tiny flaws in the most exquisite gem. At any moment, in your blindness, your ignorance, you may overstrain a weakness and find your jewel ruined in your hand, a victim of your failures."

A PICTURE FROM POINT LOMA

SUN is linking sea and sky;
Winged songsters homeward fly;
Dying melodies float along,—
Children's voices—vesper song.

Lo! o'er the wings of the sun-tinted west,
A softening grey is intoned with the gold;—
Comes now Queen Night—puts her children to rest,
Wrapped in her veil. Through a silvery fold,
Hesper is twinkling; his clear, serene eye
Meeting the earth-born, who look to the sky.

Music leads while shadows fall;
Open doors to lighted hall,—
Flower-altar, garlands gay,
Nations' flags in proud array;—
Mighty strains of music swell,
Lift the mind, with magic spell.
Now it changes, soft and sweet,
Timed to children's dancing feet.
Happy voices heart-light bring;
Little fays from rosy spring;—
Flower-wreaths in flowing hair:
Joy is beaming in the air.

O, here is peace, here is hope, here is rest.
Brotherhood-workers, with hearts full of cheer,
Meeting as comrades, from east and from west,
In freedom of soul, and in absence of fear.
Their voices ring out, in the star-sprinkled night,
The watchwords—"For Truth, Liberation, and
Light!"

Student

Fearfully trembling, I looked at it, my treasure, my beauty, my flawless one. Oh, not perfect! As I looked, I saw tiny weak places that I had not seen before, and I knew the truth about my own arrogance and ignorance. What should I do? *What should I do?*

The blazing lights beyond brought hope, and I knew as I walked toward them that love should teach me to keep my jewel bright until I should reach that place. By-and-by I came there, weary and dazzled, and with great love set my dim little jewel upon the altar along with those that sparkled so lustrously. Happy I, whose little treasure has become a part of that clear brilliance shining out into the dark and troubled world, lighting all dear hearts home!

W. D.

Facts Worth Knowing

BLACK lions are found only in the Sahara Desert.

A GREAT naturalist, Sir John Lubbock, once had a pet ant that lived to be 15 years old.

GENERAL Robert E. Lee, the hero of the Confederacy, completed his course of study at West Point without a single mark of demerit.

IN the Arctic regions there are some animals which are black or brown during the short summer but turn pure white in winter and so can not be noticed on the snow, thus escaping harm from beasts seeking prey.

THE CHILDREN'S HOUR

Lomaland Photo. and Engraving Dept.

THE BOYS AND GIRLS OF THE RAJA YOGA DAY SCHOOL, SAN DIEGO, CALIFORNIA,
AT THEIR CHRISTMAS FESTIVAL

What is the Heart-Light?

"WHAT is the Heart-Light?" Nora asked her sister Florence; while Ben paused in his play to hear the answer. Florence mused for a moment, then she told them a story.

"Long, long ago a beauteous Being, a Son of Light, longed to help the people of Earth, and he knew there was only one way, and that was to touch their hearts. The Great White Light of Love and Unity enveloped them, but it could not make a home within their hearts unless there was an altar there upon which it might rest, and the Bright Spirit knew that it could only be formed from his own radiant light.

"This meant to go far away from his beautiful happy home in the Great King's country where all is love and harmony, down into the world where there is so much discord. But the beautiful Being knew there was no other way to help the people except by entering their hearts, so he opened wide his wings and flying to Earth with a heart full of love he turned himself into thousands of shining hearts, one for each human being and each aglow with love, and longing ever to return to the country of the Great King. And all these shining hearts are brothers, and they are always working to help people to try to live the heart-life, which is one of brotherhood and unity; for these shining hearts know that when this is done the people of the Earth will be glad, and the beautiful Being of which they are the parts, will be able to return to the home of his Father, the Great King."

"Is there one of the shining hearts inside my heart?"

"Surely," answered her sister.

"And Ben's too?" asked Nora again.

"Yes indeed," said Florence.

EACH OTHER

LET us help each other;
This day must we try;
Wait not for another,
Time is flitting by.

Let us cheer each other,—
Give the ready smile;
Thinking of another
Shortens every mile.

Let us love each other,
'Tis a rule of gold;
When we love another,
Love doth us enfold.

Helen Elizabeth Coolidge

"How do you know?" said Ben—but he hoped it was true.

"Why did you get up in the middle of the night to let little pussy in out of the rain? And why do you behave as well in school when the master is away, as when he is there?"

Ben smiled; no words were needed to answer.

"Is it trying to be as good as ever we can, that will help the Heart Fairy to get back to his beautiful home?" Nora asked earnestly.

"Yes," said Florence, "by loving, and sharing, and helping, and so bringing about unity, which will cause us to feel the joy of the beauteous Being, and go with him hand in hand to the glorious palace of the Great King."

A Strange-looking Boy at Point Loma

WHERE is that whistling boy? I cannot see him. He keeps on whistling; what does he want? Whom is he whistling for. He is plainly calling someone; perhaps me. I will go and find out. Ah! Are you the boy? Now I see who does the whistling.

I found him sitting on the porch of a house. He wore a bright green suit of clothes, with the sleeves elaborately embroidered in red, yellow, and indigo blue. His boots were black. A green hood covered his head so that I could only see his dark gray nose and round, yellow eyes.

When he saw me he stopped whistling and said, "Halloo! Good boy!"

"Well!" I said, "you funny fellow; you are a good little parrot!"

"Good-bye!" said the parrot; "pretty bird!"

AEA

Canaries' Singing Saved Many Lives

ONE of the very cold nights lately in Chicago a fire broke out in a building in which no less than fourteen families were living. They were all saved though they were forced out into the cold, and they owe their lives to twenty-five canary birds who chirruped so loudly and so long that the sleeping people heard them and woke up in time to leave the building safely. The canaries saw the fire first and kept on singing even amid the flames, for the firemen were so busy getting the women and children out that they could not save the birds. Brave little songsters, singing away to save others' lives. G.

A Doll in a Strange Place

FOR a long time a little girl, who had to work in a factory in England, used to take something rolled up in her apron with her every day. She kept the precious object well covered up and it was only after two years that some one found out that it was—a doll. The poor child had no chance to play with the doll as she was busy all day but at any rate she took her along for company. And Dolly kept the secret. M.

THE SECRET DOCTRINE

THE
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

SOME OF THE ERRORS OF CHRISTIAN SCIENCE CRITICISM

by **H. P. Blavatsky and William Q. Judge**

CONTENTS:

"The Empty Vessel Makes the Greatest Sound"
A Note of Warning

—by **H. P. Blavatsky**

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by **William Q. Judge**

A MOST VALUABLE PAMPHLET. Outside of Theosophy there is given no adequate explanation of the healing that is at times accomplished, nor of its rationale, nor of the ultimate price that must be paid and the dangers connected with such practices.

This pamphlet is invaluable to all students.

Was Jesus the first Teacher of Compassion?

UNDER the title of "The Religion of Kindness," is noticed a most extraordinary article in the London *Spectator*. This influential and usually well-informed paper positively commits itself to the following statement:

No doubt our Lord . . . must be admitted on all hands to be the true teacher of peace and goodwill to men,—the first revealer and expounder of the doctrine of human kindness.

The article is written in contravention of Lord Morley, Secretary of State for India, who had said that he refused to believe that Oriental countries inevitably and invariably interpret kindness as fear; and he had backed up his opinion by pointing out that the founder of Christianity was born in the Orient. To this the *Spectator* replies that the Orient crucified him, so that the argument points the other way. Continuing, it says:

Though Christianity, with its message of kindness, has conquered all Europe and the Western world, it has never been able to make any real headway in the continent of its birth. . . .

For ourselves, we should say that though Orientals, like other human beings, appreciate kindness, they do not rate it nearly as high as the Western peoples do, nor as our Lord taught the world to rate it. The fatalism which is obvious, or perhaps latent, in every Oriental creed as its rock

foundation must tend to make men somewhat indifferent to kindness. On the other hand, the mystery of free-will co-existent with, and yet not antagonistic to, the Divine Omnipotence and Omniscience, which is the essential characteristic of the religion of Christ, encourages and stimulates kindness to others. Oriental kindness must to some extent be passive because of the fatalism behind it. The Eastern feels that if it is the will of God, the sufferer will be relieved, and if it is not, he will not, but that in the mighty march of the Divine order neither event is of any great importance. The Christian, which is in effect the same as saying the Westerner, believes it to be his duty to make himself the active instrument of the will of God.

The writer is good enough to add that—

Every man who knows the East could give hundreds of examples of true kindness in the Orient. Still, when all is said, and the balance is struck, kindness is, we are sure, viewed with less passion in the East than in the West.

In the next week's issue of the *Spectator*, a writer quotes Dean Church to the effect that:

The Universal Doctrine of Compassion

The ideal of this was complete sacrifice of all that was pleasant to flesh and blood, for the sake of the soul—to deliver the soul from the passions, and ignorance, and slavery, and burdens of this mortality and it was accompanied by two things: the most

passionate enthusiasm to communicate with, and so to help and deliver others; and a *spirit of tender and all-embracing kindness*, which expressed itself in the most touching language, and embodied itself in the most touching acts; which sought out the forlorn and the miserable, and which willingly associated itself with the degradation of the outcast, and with the shame and doom of the sinner. Such an ideal was presented to the men of the East before our Lord appeared.

So that it is clear our champion of Christianity has not got this justly respected and scholarly Dean on his side. But there is no need to quote Dean Church. The statement of the *Spectator* is so absurd and contrary to the well known facts that it would be a waste of time to refute it. Has the *Spectator* never heard of *The Light of Asia*? And what of the bibliography of Bud-

hism, not to mention other ancient religions of India? Shall we quote from the teachings of Zoroaster? Or shall we give passages from the *Book of the Dead*? The whole thing is too absurd for words. The Doctrine of Compassion has ever been the central teaching of the Wisdom-Religion and the cardinal principle of all the religions that sprang therefrom. Jesus but echoed it. It is in fact the Law of Life, the life-breath of the human Soul. For all who have ever recognized the Divine nature of man, Compassion has been the master-key to the Mysteries. And we have the whole of the mighty Buddhist world before us today, opened out as never before, as testimony to the spirit of compassion in Gautama Buddha's teachings!

What can possibly have been the object of a great paper in making such a wild statement? One can only suggest that the pressure of modern progress in thought has made itself felt to the extent of forcing to the sur-

face the latent beliefs of even the most circumspect. No one can sit on the fence nowadays; the fence has been too rudely shaken;

hence we often find people executing reluctant leaps down on the side they are least afraid of. But what are we to think of the scholarship or general reliability of an authority which can declare flat-footedly that Jesus was the originator of the doctrine of compassion?

And think of the statement that "kindness is viewed with less passion in the East than in the West," written in the midst of a great city where thousands are daily living on the verge of starvation in the midst of others living in luxury, and where, in short, there is a vaster and more varied assortment of un-

Such Bigoted Assertions Simply False

The Result of Centuries of Distortion of Truth

kindness and selfish indifference than was perhaps ever gathered together in one place. Again language fails to describe this statement adequately. What *must* the intelligent Oriental, reading his *Spectator*, think of this complacent panegyric on the passionate kindness of the Westerners, all

The Compassion!! glowing and flaming with the
of Western desire to help their brothers
Civilization in consequence of the teachings of their Savior? What

kind of a world do such writers live in?

And the extraordinary ignorance—for so charity bids us call it—of the sacred literature of the East, on the part of a journal professedly so great an authority on literature! Not to know that, instead of fatalism, the East has the most profound and philosophical conceptions regarding the nature of the human will and its relation to the Divine will; in comparison with which the philosophy of Christianity (if we can use the word philosophy at all) is the merest child's talk! The East, with its Adepts, its Mystics, its Sages, its Holy Men, its universal belief in the possibility of man's attaining union with the Supreme—this East, we are asked to believe, teaches that man cannot alter the decision of God or Fate and that man's actions are of no avail!

The "Heart Doctrine" of the East The teachings of Theosophy, which are a presentation, in the language of modern thought, of the ancient tenets of the Wisdom-Religion, have been expressed largely by means of terms and conceptions taken from Oriental philosophies and religions. And those teachings clear up the question of the human will and its relation to the Universal Will with a clearness quite unknown to Christian theology. If ever we do find among Eastern peoples a tendency to fatalism, that merely represents a falling away from the true teachings of their religions and philosophies; and the same thing is found in even greater degree in the West, the land of Calvinism, vicarious atonement, and of the doctrine that the Roman church determines the interpretation of scripture and the Pope is the supreme arbiter of the decisions of the church. To compare the superstitions of one country with the highest professed ideals of another is not fair.

Other writers, with more discernment of the signs of the times, are asking whether the West has not taken the wrong path in life, while the East has comprehended the meaning of life better; and the last few years have made patent to all that the East contains a latent power that can unfold most unexpectedly.

The Meaning of Life is Compassion The champions of the supremacy and uniqueness of Christianity are driven to their last defences; and if this is a specimen of the kind of resource to which they are driven, the indications are that they are in a bad plight. For whatever Jesus was, whatever his teachings were, nothing can be more certain than that the doctrine of compassion did not originate with him. Nor is it any disparagement of the Master to say so; he himself claimed that his teachings were of old from the beginning; he was an interpreter of the Divine Law, and an exponent of it in his own life.

H. T. EDGE, B. A., (*Cantab.*)

William Q. Judge on Planetary Influence

IN days when "astrology" and similar fads, depending for their popularity on the small modicum of truth they may contain, are so much in vogue, it may be useful to make clear the position of Theosophical students with regards to them. Can a thing be true and yet mischievous? is a question that may be asked, implying that if it is true, it can not be mischievous. But the necessary rules of logic require us, if we would reach sound conclusions, to be precise in the use of words. Does the word "true," as used above, mean "wholly true" or "partly true"? On that point hinges the whole matter. A thing that is only partially true may be very mischievous, from its ability to deceive those who do not perceive the error that enters into its composition. And this is precisely what a Theosophist would say of modern so-called "astrology" and kindred arts of divination.

Let us turn to a letter on this very subject, written by the second Leader of the Theosophical Society, William Quan Judge, as long ago as 1888. Writing to *Lucifer*, H. P. Blavatsky's magazine, he says:

Over the ambitious signature of "Magus" a correspondent asks in your July issue, "What is planetary influence and how does it act on man?" . . . Not being myself a Magus I will not assume to fully describe planetary influence, since to do so would lead us into realms quite beyond our comprehension. But we will get a better idea of the subject by recollecting that the ancients always considered the "ambient"—or entire heaven—at birth, as being that which affected man, and that planets were only the pointers or indices showing when and where the influence of the "ambient" would be felt. The modern astrologers, following those great leaders, but unable to grasp the enormous subject, reduced the scheme to the *influences of planets*. They have thus come to leave out, to a great extent, influences cast by powerful stars, which often produce effects not to be sought for under planets: "When such stars have rule nor wise nor fool can stay their influence." The planets were held, rightly as I think, to be only foci for "the influence of the whole ambient," having however a power of their own of a secondary nature exercisable when the ambient influence was weak.

It seems clear that the zodiac and the planets that move in it have an influence, but that this influence is small by comparison with other influences that obtain; the case being similar to that of a comparison between the moon and the sun as sources of light. The moon gives light at such times as it happens to be strong and the sun is not there. The zodiac and planets exercise a noticeable influence only in cases when the other influences are weak. This exactly meets the case of modern "astrology," whose predictions are so unreliable, yet in which there is just enough truth to keep it alive in a restricted circle.

But Mr. Judge was generous. He generously assumed that modern astrologers could and did achieve accuracy so far as their limited sphere was concerned. But do they even do this? Experience shows that we very seldom find them taking any account of the *position* of the Zodiac in the celestial sphere, which of course may vary from a small arc with low altitude to a large arc towering into the zenith. They merely consider the position of the planets in the Zodiac, not asking where the Zodiac, and consequently the star, actually is. Thus two people may each have Mars in the "midheaven," and so be put in the same class; yet in one case Mars may be in the zenith, and

in the other down towards the horizon! One would have thought that if planetary influences are so important with modern astrologers, the position of those planets in the celestial vault would be a matter of moment; but such does not seem to be the case. Ecliptic longitude alone—even longitude and latitude combined will not give a planet's position; and for the most part even the latitude is ignored.

It is easy to see, then, that this so-called science contains enough error mingled with a little truth to constitute it a fruitful source of misguidance. And the same applies to other so-called sciences which give partial indications or show minor influences. But the worst phase of the question is that by pinning our faith to these indications, *we thereby render ourselves more subject to those minor influences than we otherwise should or need be*. Just as a Church may swing the world so long as people believe in the efficacy of its blessings and cursings, but loses all its power the moment they refuse to believe and venture to defy those pronouncements; so planetary influences which have dominated us may lose their power to do so the moment we realize that we are really superior to them.

The "planetary influences" would seem to be affiliated with a certain set of minor influences that revolve in our own nature, and that run, like those of the sky, in a belt that rises a little above and falls a little below the waist. They correspond to the "Lower Manas"—the inferior or terrestrial aspect of Mind—where the earth-bound emotions and their associated ideas and fancies hold sway. Most people are as yet bound by these influences; but it is man's destiny to rise superior to them. The first step towards the achievement of this freedom and supremacy is—to realize that in fact we are thus free. For, as in the instance given above, it is the fact of this realization that breaks the chains. Thus we may rule our own planets. Mars and Venus may do what they will in their own sphere, but the tranquility and independence of our own Soul they shall not avail to disturb. Let us render the influence of the "ambient" stronger in our lives, and then the planetary influences will grow so unimportant that we may defy any astrologer to presage our fate. STUDENT

The "British Association" in America

NEXT Autumn the British Association for the Advancement of Science visits Winnipeg, and will also spend some time in the United States. Twelve hundred members are expected, headed by Professor Sir J. J. Thompson. This famous Association, which was founded in 1831 at the suggestion of Sir David Brewster, meets annually for a week in the early autumn, but never in London. It takes care of all branches of science, economic as well as natural, and its transactions have been reviewed in the *CENTURY PATH* on several occasions. It is assisted by grants of money, a system which has been coveted by this country as placing science on an independent basis. The President changes every year, and the principle is to allow different branches of science to provide the President in turn. Thus extremely broad-minded and even revolutionary ideas have been given from the Presidential chair, and the body is a happy mean between a science too popular to be academic and one too academic to be popular. T.

Some Views on XXth Century Problems

The Spectator's Discovery

THE (London) *Spectator*, commenting on a remark of Lord Morley's anent the susceptibility of the Oriental to kindness, calls Jesus Christ "*the first revealer and expounder of the doctrine of human kindness.*"!!

The *Spectator* surpasses itself, but will not even some Christian rise and protest? Has not a single one of the readers of the *Spectator* read a single one of the sermons of, for instance, Gautama Buddha? Some of the things they might find there surpass in energy of expression anything that is to be found in any of the Gospels. Unbounded love of humanity is the insistent keynote of everything Gautama said.

Let no one deceive another, let him never despise another in any place; let him not out of anger or resentment wish harm to another.

As a mother at the risk of her life watches over her own child, her only child, so also let everyone cultivate a boundless friendly mind towards all beings.

And let him cultivate good will towards all the world, a boundless friendly mind, above and below and across, unobstructed, without hatred, without enmity.

Standing, walking, or sitting, or lying, as long as he be awake, let him devote himself to this mind.

In India's great spiritual poem, the *Bhagavad Gītā*, the Spirit of the Universe is represented as speaking to the warrior-hero Arjuna. In the last verses, after giving him its final teachings, it says:

He who, with supreme devotion, expoundeth this supreme teaching to my worshipers shall come to me; and there shall not be among men anyone who will better serve me than he, and he shall be dearest unto me of all the earth.

To teach others is thus outlined as the final duty of those who have learned to know this Spirit. And earlier in the poem the hero is instructed to go so far in self-forgetfulness as to make the self of others *his* self. "The man of purified heart . . . for whom the only self is the self of all creatures," — a sentence translated by Burnouf as "*vivant de la vie de tous les vivants*," living one with the life of all that lives.

The *Spectator* sentence is a libel upon every one of the great pre-Christian Teachers of religion. What would Jesus himself have said of the advancement of such a claim for him?

Cultivated Negativity

A LONDON journalist, writing in the *Fortnightly Review*, remarks, apparently with pride, that he has the "gift" of automatic writing, adding that he has a lady friend "who can write with my hand at any distance with even more freedom than she can write with her own." He gives a striking instance of the working of this "power," seeming to regard it as a very valuable possession.

Automatic writing means the retirement of the will from oversight of bodily movements. The writing movements which then result must therefore be directed from with-

out, as in the case in question: or by anything that happens to be active in the subconsciousness. In either case the writer has permitted himself to become negative — to another person, or to some force in his own nature to which he should be positive.

The automatic writer forgets that when he has let something in, or up, which replaces his own will in the movements of his arm and hand, he has also let something into his *mind*. This may be a thought or an impulse; or some subtler influence which will later develop into a thought or impulse — then regarded by him as his own and either expressed in conduct or woven into the mental fabric. And that this infection, *permitted* a few times, begins to become automatic, goes on in unobserved passive moments, and at night. And lastly that it never alters mind and character for the better, *always for the worse*. Evil is always about us and in us, and the one guard is *will*. Take will off its duty and evil begins to come in. The automatic writer will never notice that his power of concentration is weakening, his trains of thought getting confused; or that he may be falling victim to vanity or sensuality; or that even *petit mal* ("little epilepsy," attacks of a moment's duration) may be setting in. For with these results he is losing the power of self-judgment. But his friends may see; some time they will see.

The state in which automatic writing is done is a state of hypnotism, slight in degree, but open to suggestion like the same state produced in the recognized ways. STUDENT

The March of Suicide

THE suicide list for last year has been made up. Nearly eleven thousand Americans brought their own lives to an end. The total for 1899 was about half as many. Since then the increase *up to the double* has been year by year uniformly progressive. As many committed suicide last year from despondency alone as committed it from all causes combined in 1899. Most of the other countries are in the same case, some worse.

The newspapers reporting this, draw no conclusions, get no suggestions from it. But obviously the number of suicides is an index of the general suicide tendency; and the general suicide tendency is therefore twice as great as it was ten years ago; the interest in life is half; the intuition of its value and meaning is half. He who commits suicide cannot make it yield any value or meaning for him. His fellows still try to make it do so by calling upon and exhausting the pleasure-centers of their being, by any and every method filling up consciousness so that it has not time to look in at its real emptiness. The "rush of modern life" of which we are so proud is not vitality, it is fever, it is the other aspect of suicide. It may be twice as great as it was ten years ago; but the equal progress of suicide — *even among children* — shows what it is.

In other words our civilization is failing; if it does not change its methods it will utterly

fail, for it is unconnected with the real spring of life.

Life has in it possibilities of joy of which all the pleasures are but the poorest substitutes. But the path to the joy wants a little searching for, now; the pleasures are close at hand, for those who still find them pleasures. In the search, however, man may be doing the very highest of all possible services to his fellows. In finding his own soul in the silence he is touching a thousand hearts with a secret hope which does its work though their minds can neither account for nor justify it. He has gotten knowledge, and the message that there is a way has gone forth.

Civilization has forgotten the soul; yet man lives on a still continuing but now nearly exhausted wave of true life which the soul once sent forth. It is this which makes his mind other than the mind of the animal. If civilization is to continue, man must open the old channel for another supply, and then keep it open. He has used it to enhance even sensual pleasure beyond any possibility of the natural animal. So his body, hardly preservable from disease for a minute, is nearly worn out. Modern medicine, on its present lines, will never open up any new stores of vitality; at best it will conserve a little longer what there is. For a new supply man must go to the source, his long silenced soul. There is no other cure. And the professing teachers of the time, who can tell him exactly the path to God, are strangely silent about the path *which must first be trodden* before there can be any entry upon that other — the path to the soul. One must perforce ask how much they really know of either? And whether their ignorance, behind their professed knowledge, may not be the radical cause of the failure of our civilization? STUDENT

Child Suicide

PRUSSIA is getting alarmed at the suicide list of the school children: Up till 1903 the average for the higher schools was 14; last year there were 25 *reported*. Various causes for the increase are suggested, most usually over-pressure. Wedekind, the dramatist, suggesting *the force of example*, probably covers more of the ground.

But the example need not be witnessed, told of, nor written. The sustained *thought* of suicide, energized by despair, is far more infective than we usually realize. Theosophy teaches that the victim of his own act is *not dead*, but rather self-condemned to live on amid the thoughts that surrounded the deed until the hour of his normal death — therefore perhaps for years. Those thoughts and pictures are within the human atmosphere and are continually about the minds of the living and embodied.

The suicides of children and adults will go on till we have so altered the ways of civilization that life is seen in its true promise and beneficence. But that means, to begin with, Brotherliness. After that, all is easy. Brotherliness is the first word of the soul, the one essential of a stable civilization. STUDENT

Archaeology

Palaeontology

Ethnology

Pompeii

POMPEII has risen to a fame, which it would otherwise never have achieved, by a visitation from the hand of Nature, whose very punishments are blessings in disguise. The inhabitants were visited with death, which is the common lot of humanity, and many suffered deprivation and want, which is also a not infrequent lot. The Law did but concentrate its workings on a single spot and moment; and, in doing so, it was sealing up for long distant generations an invaluable record and testimony of ancient life. Thus buried Pompeii has risen again as a triumphant herald of ancient tidings, contributing no small share to the preservation of our heritage from antiquity.

The little we know of the origin of the town indicates that it was very old and had been under many successive conquerors. According to Strabo it was first occupied by the Oscans, then by the Tyrrhenians (Etruscans) and Pelasgians, then by the Samnites, before coming into the possession of Rome. It was a fashionable resort and gathering-place for people of many nations. There was an earthquake in 63 A.D. which destroyed or seriously damaged a large part, including most of the public buildings; and the inhabitants were still engaged in rebuilding when, in 79, the eruption took place. Being covered with ashes and small stones to an average depth of 18 or 20 feet, it has been more easily disintombed than Herculaneum, which was buried under volcanic tuff (hardened mud). The burial was so complete that the site was forgotten. In 1748 it was discovered that beneath the vineyards and mulberry grounds were the ruins of an ancient city, and in 1755 systematic excavations began and have been continued since.

The town was situated on a small eminence within a mile of Vesuvius and was an irregular oval about two miles in circumference, surrounded by a wall except on the shore side. The plan is regular, the streets being rectangularly laid-out, with the exception of a principal thoroughfare leading from the gate of Herculaneum to the Forum, which is crooked and narrow, being in some parts only 12 or 14 feet wide including the raised footpaths on each side. The other streets rarely exceed 20 feet. They are paved with large polygonal blocks of hard basaltic lava, fitted closely. At the sides were raised footpaths, connected from place to place by stepping stones, which must have been awkward for the vehicular traffic. But the streets can hardly have been frequented to the extent they are in modern cities; the living rooms of the

Lomaland Photo. and Engraving Dept.

EXCAVATED SHRINE, POMPEII

Lomaland Photo. and Engraving Dept.

STREET IN POMPEII

houses open to the interior and present blank walls to the street, except in some places where there are shops. Any description of the plan of the town, so far as excavated, or of the numerous public buildings, would take too long; the most important item is the private houses, in which Pompeii is unique. All kinds have been preserved, from the humblest to the most pretentious, and enable us to verify the descriptions coming from literary sources. STUDENT

The Chapelle-aux-Saints Skull

THE human skull found by two priests in a cavern near Chapelle-aux-Saints, France, and mentioned in the *CENTURY PATH*, vol. xii, no. 13, proves that man existed at a very remote age, and that this particular specimen was of a different type from that of the ordinary civilized man of today. More than this it does not prove; the rest is theory. We dare not even say that that type was more degraded than the present type; we only know that the skull was differently shaped. The present Caucasian type, with its large development of the forehead, constitutes our standard of high development; but it is by no means so sure that this particular conformation was always the mark of the superior races, or that the particular development of some of the reasoning faculties, which characterizes our own civilization, marks the high-water mark of mental development. Again, even if we regard this skull as belonging to a degraded type, no more is proved than that such degraded types existed at that time—as they do at this time—and that the owner of the skull perished, as might be expected, unburied, out in the wilds, among the beasts. But the question whether there were civilized people contemporary with him—as there are civilized people contemporary with the barbarian of today—is left unanswered.

Finally, no analogy that may have been noticed between the shape of this skull and that of an ape is warrant for assuming that the man was descended from the ape. Such a theory is entirely unsuggested by the facts and is due to a preconception. In the account of an interview with a French museum authority, he is even made to say that this analogy shows a close *parentage* to the chimpanzee; one would like to know how he infers parentage. Science is over-careful as to facts when called on to admit an unwelcome truth; but, when a favorite theory is to be supported, the slightest circumstance that can in any way be twisted into a confirmation of that theory is eagerly welcomed as proof. STUDENT

The Trend of Twentieth Century Science

Laugh, but—

IT may be a good thing to laugh—at the right things; but it is not at all a good thing to grow fat. This is now on statistical evidence, furnished by the medical director of one of the New York life insurance companies.

The first point was to determine from an enormous number of measurements the relation of height to weight in averagely healthy people. Then to determine the mortality of these people; and then the mortality of those whose weight is under or over that proper to their height. It would seem that both men and women gain weight slowly till somewhere between 55 and 60; then there may be a few years in which it remains stationary; then it begins to go down. It would seem possible—Dr. Osler notwithstanding—that not till the year at which this increase ceases, should physical efficiency cease to advance.

The proper weight being determined, and the deathrate going therewith, it turned out that the deathrate rises the more that weight standard is departed from in either direction. But it rises much more when the departure is in the direction of excess than when the other way. And it would appear that in the latter case it is not the defective weight that is the usual cause of the higher deathrate, but tuberculosis, which first becomes the cause of the defective weight. No one, therefore, who is under the usual standard of weight, but is otherwise healthy, need bother about it.

But to be over the standard is another matter. Especially at ages over 30 the deathrate rises with every additional rise in the weight called normal for any particular age. And not only so, but the additional weight makes the presence of any disease which may coexist, more serious. Where the abdominal girth exceeds that of the expanded chest, the condition may be said to constitute a disease in itself.

The diseases to which the overweights are particularly liable as contrasted with the underweights, or which in them are much more frequently fatal, are of the nervous system in general, of the heart and circulation, of the liver and digestive system, and of the kidneys. It is evident that the excessive eating and insufficient exercise which are causing the weight are at the same time causing the malady.

STUDENT

A Theory of Mimicry

THE naturalist Mr. Selous has made a remarkable suggestion to account for a number of the cases hitherto regarded as protective mimicry.

It is natural, on seeing the close resemblance of a creature to its surroundings—for example of a butterfly to the twigs or leaves upon which it rests, or of a caterpillar to a bit of a dead stick, or of an innocuous creature to one that stings—to assume that the mimicry protects.

But there are many puzzling cases in which the mimicry is carried to an altogether unnecessary and extreme degree inexplicable by

natural selection; and others in which it is useless. It is, for example, useless for a night-flying tropical moth to imitate a day-flying wasp, for the former's enemies know nothing of and therefore do not fear the latter.

Mr. Selous suggests "the influence of environment." He means that the environment as a whole, its colors and general features, or some one element in it, in some cases somehow affects the creatures in contact with it. He does not amplify, but if we venture to do so for him the theory means that the formative subconsciousness, the conscious formative vitality, of the creature is affected by some colors or forms about it, whether of nature or another creature, so that the young of that creature tend towards a resemblance.

He is merely suggesting for the animal kingdom a process which in the human kingdom constitutes one of the varieties of "mother's marks," and the theory is doubtless quite valid.

STUDENT

Astronomy and History

THE orbits of astronomy and history occasionally intersect and then we learn something of one and perhaps of both. In this way astronomers have become assured of a minute lengthening in the day and the year which is still going on.

In 1693 Halley showed that the month is slightly lengthening. Professor Newcomb thought that history might help here, and he accordingly considered a set of nineteen eclipses of the moon recorded by Claudius Ptolemy as taking place between 721 B. C. and 136 A. D., measuring from them the rate of increase and corroborating Halley's calculations.

The year is also lengthening. But this, Professor Newcomb did *not* take into consideration, and so he rejected as incorrect the traditional dates of a number of ancient solar eclipses, namely:

Nineveh, 763 B. C.

Archilochus of Thasos, 648 B. C.

Thucydides at Athens, 431 B. C.

Agathocles, near Syracuse, 310 B. C., and

Tertullian at Utica, 177 A. D.

Mr. Cowell, of the Royal Greenwich Observatory, did the necessary work upon these dates and found them not only consistent with each other but with Professor Newcomb's and Halley's variously reached calculations respecting the month. The nineteen lunar eclipses and the seven solar pointed to the same facts, the lengthening of the day, the month, and the year.

Moral: perhaps ancient traditions correspond with fact after all!

STUDENT

The Plane of Life

DR. HALDANE, in his address before the British Association for the Advancement of Science, tried to advance science by directing its gaze to a plane behind or above that of ordinary matter and energy, the plane of organic life. Organic life, he argued, uses these but is not of them; it is metaphysical. The persistent identity of a liv-

ing organism is not physical identity, since the matter of it is changing every moment and in a little while has wholly changed. For a similar reason it is not energy-identity.

In recognizing it as an organism we are applying an elementary conception which goes deeper than the conceptions of matter and energy, since the apparent matter and energy contained in it, or passing through, or reacting with, the organism are only the sensuous expression of its existence. . . . It must be . . . the aim of biology gradually to penetrate behind the sensuous veil of matter and energy which at present seems to permeate the organic world at all points.

The unit of living matter, whatever it is, should stand to the biologist as the unit of inorganic matter—molecule or atom or corpuscle—stands to the chemist and physicist.

A unit of life is a unit of nature-feeling, continuously embodying itself for the completer expression and working out of that feeling. That desire is the active cause of variation, of evolution. The unit may be passive to its environment or make-up in respect of ninety-nine per cent. of its doings, or ninety-nine per cent. of each doing; but there is always the unobserved residuum, the one per cent., in which it is acting from within, outward, impressing instead of impressed by, its own molecular structure, advancing. Such within-arising activity, when considerable or summed, becomes one of the causes of the marked variations now called "mutants" as well as of lesser and less permanent ones. Nature, thus viewed, begins to appear very intelligible and rational.

STUDENT

The New Planet

A NEW planet seems to be as it were in the air, new in the sense of unknown.

Neptune has been lately found to be conducting himself a little irregularly, and from these irregularities Professors Pickering and Forbes have tried to work out the place of a planet even beyond him. When he is found, he will in that sense be new; his actual age will be his own secret. He may be as old as the sun, or he may be a comet recently captured and made to settle down into steady life.

It seems unlikely that he will conform to Bode's law, for that gives evidence of failure to correspond with facts when we get out as far as Saturn. If you take the number 4 and add to it successively the geometrical series 0, 3, 6, 12, 24, 48, 96, 192, 384, and 768 you get a series of numbers of which the first six correspond pretty well with the relative distances of the first six planets from the sun: Mercury being 4 (accurately 3.9), Venus 7 (accurately 7.2), the Earth 10, Mars 16 (15.2), Asteroids 28 (27.4), Jupiter 52 (52.9).

At Saturn, considerable divergence begins, the Bode number being 100, and the real number 95.4. Uranus also diverges by 4 points, and Neptune by 88. His Bode number is 388, his real one 300. The Bode number of the new planet is 772; what his real number may be we cannot tell. Perhaps Uranus, or even Saturn, may be the last to own allegiance to Bode's distance scale.

Voyage of a Buoy

THE Christiania Meteorological Institute has received a letter from the island of Sörö in Finmark, stating that last November a buoy was driven ashore there. It contained a letter to the effect that it had been set adrift on July 24th, 1900, near Cape Bathurst on the north coast of America, 250 miles north-east of the mouth of the Mackenzie River. Thus it has traveled for over eight years and has probably been through the Polar Sea and the North Sea, between Greenland and Spitzbergen, to Norway.

Civilization Destroyed by Waste

THE visitation of God and the working of Karma operate largely through human agency, men thus rendering themselves the instruments of their own undoing. To some minds this thought seems to be like an explaining away of Providence or Higher Law; to other, and better balanced minds, it is but a confirmation and illustration of the working of these higher Laws.

President Roosevelt's remarks on the reduction of part of northern China to a desert through reckless lumbering in the past, raises speculations as to the possible extent to which the cause may have operated in other parts of the world. In many places we find old countries blighted with barrenness; and in not a few we find now but the traces of civilizations that once occupied the wastes.

In the *National Geographical Magazine* for January, the U. S. Consul-General to Smyrna writes as follows of Pergamus:

The hills, however, for the most part are barren of forestry. The ruthless devastation of the timber resources of this country for centuries has done its work, and I very much doubt if even a rational system of forestry will ever bring back to those hill-tops again the magnificent pines which once adorned them. Nature has been too badly treated. The soil which slumbered upon those slopes at creation's dawn has sifted to the valleys, and the floods have carried it away to the sea. Nothing now remains but sterile rocks which bake in the glaring rays of the torrid sun.

And he goes on to speculate as above as to the responsibility of man for the devastation

Lomeland Photo. and Engraving Dept.

BROOK AND WOODS, NEAR ARCACHON, FRANCE

that has followed in his tracks. Luckily we are waking up to a sense of the necessity for true economy in our use of Nature—an economy, not of the individual for himself, but of each individual for the whole society. When humanity approaches Nature with the thought, What will this profit me? then it is like a swarm of locusts on the face of creation. Our Forest Service is wiser; but it has had to undertake what individuals cannot be trusted to do of themselves.

But what a thought! That some of the mighty civilizations of the past may owe their destruction to such a very human cause as reckless use of the forests! In other words, that selfishness, the loss of the national conscience, led to its inevitable myopia, blinding

people's eyes so that they knew not what they did, causing them to say, "Let us be happy today, for we know not what tomorrow may bring forth; we are in the hands of God!" They had forgotten that they *were* the hands of God, and that if they did not act, God would be left without hands, so far as their country was concerned. Or, to put it another way, the hands of God would be forced, and the only way in which the great Law of Justice and Mercy could remove evil and sorrow from the world would be by obliterating the nation that was breeding them. Resources of Siberia

THE vast area of Siberia is as yet scarcely touched commercially. It contains over three billion acres. In 1900 it was estimated that out of 19,727,000 cultivated acres, 11,625,000 were under crops. The export of dairy products is rapidly increasing; 30,000 buckets of butter, each containing 36 pounds, were sent to London per week in 1901. The pasturage in the butter producing region, which lies chiefly in the district of Tomsk, is so good that there is 7 per cent of butter fat in the milk. In 1902 a Danish firm was the first to export salted beef, mutton, and pork from Siberia to London, and it is considered that the mutton may become a competitor in the markets of western Europe. Exports of hides and skins increased from 2800 tons in 1899 to 5200 in

1903. More than 1600 tons of eggs are exported annually.

The River Amur is rich in salmon. 2000 tons of preserved fish were exported in 1902, but the high prices of salt and tinplate are retarding the canning industry. The State forests of Russia covered 650,689,497 acres in 1906. But mining has the greatest future. Where there are so many mountain ranges the mineral resources are abundant and varied. Gold in placers is the chief mineral product at present. The average annual production of pig iron in the Ural and Siberia has been 657,440 tons from 1902-6 inclusive; and coal rose from 660,770 tons in 1902 to 1,325,400 tons in the year 1905.—Facts from the *Journal of the American Asiatic Association*

The Doctrine of Our Church

(From *Svenska Dagbladet*, Stockholm, Nov. 16, 1908)

THOUGH the discussion about "The Doctrine of Our Church," which has been going on for a time in the *Svenska Dagbladet*, has had the character of a personal debate, it may be permitted to a *tertius interveniens* to add some words, as the question is of general interest. However, I cannot take up the subject without having given Professor Santesson most hearty thanks for the manly, open, and dignified way in which he has appeared in this significant debate with Mr. Fries (Doctor of Theology), a gratitude which surely is felt by many and which I hope will not be the less welcome as it comes from a person unknown to him.

The present question is of such wide bearing that it is impossible to treat it fully in a short article. If I have rightly understood the matter, it appears to be in regard to Christianity as given in the doctrine of our Church (in the "New-Protestant" theology), and as conceived by one who without any prejudice whatever, has studied the teachings of Jesus in order to find the truth. For one who, above all, follows this last course in thought and action, names and dogmas must be of small weight in comparison with the practical contents of the teachings and their bearing on everyday life. With all due respect to the historical evolution of the church-system and to the cultural tradition this represents, all petrified growths must be cut off as soon as no blood circulates there any more. Dogmas, definitions, and names, which for centuries have brought more strife and sophistry than real religious life, have to be abandoned if we wish a Christianity that can serve as daily bread to the people in general.

It is just such a thing we now need according to Professor Santesson. And the question concerns more people than the small number of learned theologians. We live in a practical age that cares little for subtle theological distinctions or more or less fruitless definitions, and therefore it is only natural that the people can hardly be satisfied with the attempt of the New-Protestantism to re-interpret some of the dogmas in a so-called rational way. This work may be a necessary transition for free-minded theologians, but it does not reach the root of things, it does not give the people a deeper conception of the essence of religion or of its worth. As Professor Santesson has it: "it is far easier to carry through such a thing than the more far-reaching reform" which he considers necessary; but this is no reason at all why we should be content with only half a reform. Professor Santesson makes a comparison between the present situation within the church and that at the very start of the Reformation—a comparison which serves well to show the depraving in-

fluence of certain dogmas—and he is of the opinion that now as then radical measures are necessary, if the pith and marrow of Christianity shall be able to stand forth saved from the hard, lifeless shell in which the church has enclosed it.

Many will probably have their own ideas in regard to the manner in which this longed-for reform should appear, and many more are perhaps not at all so ready to give it their welcome, if in some special point it should differ from the traditions their own reform-thoughts express; but still there are those in our time who readily take a truth as soon as it meets with the demands of their soul and heart. It is for such inquirers I wish here to give information.

The necessary reform-work is already begun. Over the whole world it is carried on by an organization bearing the name of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, the Headquarters of which are situated at Point Loma, California, where the Leader, Mrs. Katherine Tingley, is living. To avoid misunderstanding and because the name of Theosophy has been and still is used in connexion with societies and teachings that are opposed to the true objects of Theosophy, it might be well to state that the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY does not endorse or approve of any other society that while calling itself theosophical is not connected with the International Headquarters at Point Loma, and of which the Leader and Official Head is Katherine Tingley. Since, even in our country, Theosophy has been said by its enemies to be something mysterious and its adherents to be cranks and falsifiers, it is only right to accentuate that it is not atheism, not spiritualism, not christian science, not healing by faith, not hypnotism, not so-called "occultism," not spookism, not clairvoyance or any kind of "spiritual" quackery. On the contrary, Theosophy makes the clearest protests against all these and is their strongest and most dangerous enemy, because it unveils their methods and purposes.

The UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, founded by H. P. Blavatsky, William Q. Judge, and some others in New York, in 1875, does not employ any supernatural mystical means or explanations; its work is wholly founded on the recognition of brotherhood as a fact in nature; "its principal purpose is to teach brotherhood, demonstrate that it is a fact in nature and make it a living power in the life of humanity." "Its subsidiary purpose is to study ancient and modern religions, science, philosophy and art; to investigate the laws of nature and the divine powers in man." In this broad way this Society will bring about the reform that many thinking men, in need of some kind of religion, are longing for at present.

This reformatory work does not turn against any special dogma-system of any church, but against absurd dogmas in general, when they are hindering men in their search after truth in the religion which stands nearest to their hearts. For, according to Theosophy, there is a kernel of truth in every religion, though it may be covered more or less by a dogmatic shell. Theosophy seeks to open the eyes to the essential in religion, for that which can make life lighter, richer, and more beautiful; and it advises everyone to grasp clearly and

realize in life the moral truths belonging to the special religion in which he has been brought up.

Theosophy is no new religion; on the contrary it will show the truth in every religion and make men abstain from fighting about unfruitful dogmas. The motto of the Society is: *There is no religion higher than Truth*. Neither is it a new movement among spiritual movements, for it has appeared more or less clearly at different epochs, for example in the Neoplatonic philosophers in the Third century who founded the Eclectic Theosophical System and established a society of "lovers of truth." The form in which H. P. Blavatsky presented Theosophy to the Western world, makes it more intelligible and useful to our time. Her writings give clear, logical answers to the moral and philosophical problems which lie at the root of life.

It is natural that Theosophy then includes everything that was taught by Jesus. It sees in Jesus just the same as does Professor Santesson, a man in whom the divine spark inherent in all has grown to a clear flame. This can, however, be achieved only by gradual evolution, as Nature knows of no sudden leaps. Thus Theosophy says that man's evolution is achieved through successive lives on earth, following a fixed law of cause and effect which reigns in the spiritual and mental worlds as well as in the physical. The necessity of just retribution and loving guidance, which Professor Santesson rightly accentuates as a cornerstone in Christianity (as in every religion)—which however in the most serious way is contradicted by the dogma of personal atonement—can be answered in full only by the acceptance of an absolute, all-pervading fundamental law in nature, from which there are no exceptions, which does not depend upon the will of some anthropomorphic Divinity and cannot be appeased by prayers or sacrifices.

This fundamental law is in reality the same as what Jesus calls "God's will," without which not a hair of our heads will be touched. And this God is, according to Theosophy, no personal being outside of the world (usually pictured as a gigantic shadow of man) but a universal, divine principle, the root of all, "the omnipresent power of evolution and involution." The law of cause and effect, according to which evolution proceeds, is the expression of the divine life in Nature and human life, and may therefore be called "God's will." Men are trained by it as it leads them forward by degrees through the great universal means, viz., that we have to bear the effects of our own deeds. It depends wholly on the free will of man how his future will be, for constantly he creates causes, the effects of which sooner or later will reach him.

It is obvious that this view of man's evolution is built on the conviction that man is a soul. This divine, responsible soul is the essential thing in man, for this it is that appears in successive physical bodies, which are born and die as all other forms in nature; this is what constitutes the real difference between man and the animals: a teaching which very clearly illustrates the hints as to the real nature of man found in the words of Jesus and Paul. Much that Theosophy has to give concerning the origin of man and his real nature is to be found in hints in the words of Jesus, but it is all too evident that the interpretation of

them given by the church has made so many thinking minds turn their backs to it, that a new, clear, and unprejudiced light on them has been necessary, if the religion in the form of Christianity should not be rejected as unsuitable for its purpose. The practical purpose of a religion may in short be said to be to serve as a backbone in daily life: the religion that does not give us such a thing we have no use for. And it is therefore that H. P. Blavatsky constantly repeats that the quintessence of the teachings of Theosophy as realized in practical life is *duty*.

OSVALD SIRÉN, PH. D.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

✽

Question Does Theosophy teach that every man—that is to say the lower personal ego—is alone responsible for his acts and must meet the consequences himself; or is the Higher Reincarnating Ego the chief actor? A man dies before he is able to amend his misdeeds, and in the next incarnation the new personality does not know he is linked with him and has to pay his debts. Does the Higher Ego sit serenely aloft, sinless and untouched by the antics of the lower, or is it responsible and cognizant of all the bad and good actions of the personality? In a word, where is the controlling agency? How does Theosophy meet the problem of man's responsibility for his acts?

Answer Supposing you had read the first of the series of Theosophical Manuals, the one dealing with "Elementary Theosophy," you would have found the explanation of this matter. You would not raise a fine point as to whether the mind had any responsibility for the theft committed by the hands. Brain may argue that theft is against sound logic; but logic, it is to be presumed, is lost sight of when hands begin to itch towards the pockets of the well-to-do. Yet you cannot punish the hands, and at the same time shield the brain from bitterness.

"A man dies before he is able to amend his misdeeds, and in the next life the new personality does not know that he (the new personality) is linked with him (the man who died) and has to pay his debts." "*I have a grand influence on my dog's moods,*" said the tail; "*whenever I wag, he is evidently pleased.*" "*I did not know I was linked with that Tongue,*" said Hands; "*last year the fellow borrowed money, and now it is I who have to work to pay it back.*" Not to speak of the fable which Menenius told the Plebeians.

Every personality is a ray out from the soul; that is to say, a part of the soul itself; and all experience gained is for the soul's sake only. If we had the sense to see it, these personalities are of little consequence *per se*. We have lost sight of ourselves, and are involved in a labyrinth of the unfitting and unworthy. We should live the lives of Gods, and be vexed by no problems, but that voices from below are perpetually calling, and we have grown amazed and hesitant under their clamor. Supposing that this royal doctrine be true; what sort of beings ought we not to be, who have lived life upon life these millions of years! Who have gathered experience among all ancient peoples; founded and destroyed empires; sailed on all seas, engaged in every manner of warfare; squandered immeasurable treasure, and known immeasurable embarrassment and grief! Signs of this olden wealth were not

lacking would we hold still within ourselves for a moment, and refuse to be crazed by the hubbub of the lower world. For the cells of the body will have their say and we must needs heed them; they cry out to be fed with their accustomed food. And ambition and jealousy will have *their* say; and every event and emotion of our days; they come crowding and clamoring into our minds, or else streaming and figuring past us with uncertainty interminable. All these are our concern; we watch them with absorbed interest, and leave remote and unremembered the substance of ourselves.

After all, it is not arguments that are needed, but rather that we should rise up with some little pride, and turn away from our degradation. There is that within ourselves which is the fundament of all we can conceive of nobility; I mean, of all that any human being could conceive, for we have lost most of the art of grand imagining. Why clamor for justice for the personality, when it is neither you nor I, but only a tool we are to use? It feels, you say; it suffers and is sentient, and therefore is entitled to consideration. Do not go too fast. When you have taken some false step or place that cannot be made to belong to you; all the world will be reminding you of its falsity a dozen times a day. You shall not abide there in quietude, nor enjoy any peace. For nothing remains undisturbed by an anomaly, and whatever is out of place is anomalous.

Now we are out of place. We imagine ourselves to be these personalities, being in truth something widely different; we have rushed in "where angels fear to tread." So all this suffering and sentience that we meet here, is to warn us that we are intolerably placed and must begone. Seeing that we will not heed, we need not complain of injustice. We were expected to carry our light into the darkness; instead we have all but forgotten the very nature of light.

"Every man," you say, "that is, the lower personal ego." Here is an unwise position, a statement pregnant with ill-understanding! Man is not two beings, that is, two separate sources of existence, but only one. For you may call his duality circumstantial, temporary, the fruit of his surroundings; but his unity pertains to the ages. The personal man emerges from the soul, and is a part of it; it withdraws, too, again and again into the soul, and in such withdrawal finds more than reward for all the suffering it may have known. For joy is the extension of consciousness and the loosening of its bonds. Personality is a cage and chains; but the life of the soul is, to be presented with wings and the freedom of ether and the deep. The first means, to be concerned with mediocre and tame operations; the second, to know all the curious motions and unravellings of life.

The brain-mind will play quaint tricks with any teaching, if you but give it leave to deal as nicely therewith as it may desire. The whole difficulty arises when our eyes are, so to say, not on the object, and we are concerned, not with life, but with comment, theory, opinion. Man is the controlling agency. Whom will you blame for the catastrophe when the driver refuses to gather up the reins, and the horse runs where he wills? Theosophy meets the problem by making clear to man his responsibility; he is none the less responsible

because too listless to take this responsibility in hand. He that is responsible is yourself, as you now know yourself: meditate upon that, and you may discover yourself to be something beyond the lower personal self; to be, indeed, beyond limitation and of unsuspected dignity.

W. B.

THEOSOPHIST. . . . Reincarnation means that the Ego will be furnished with a *new* body, a *new* brain, and a *new* memory. Therefore it would be as absurd to expect this *new* memory to remember that which it has never recorded as it would be to examine under a microscope a shirt which had never been worn by a murderer, and seek on it for the stains of blood which are only to be found on the clothes he has worn. It is not the clean shirt that we have to question, but the clothes worn during the perpetration of the crime; and if these are burnt and destroyed, how can you get at them?

INQUIRER. Aye! how can you get at the certainty that the crime was ever committed at all, or that the man in the clean shirt ever lived before?

THEO. Not by physical processes, most assuredly; nor by relying on the testimony of that which exists no longer. But there is such a thing as circumstantial evidence, since our wise laws accept it, more, perhaps, even than they should. To get convinced of the fact of Reincarnation, and past lives, one must put yourself *en rapport* with one's real permanent Ego, not with one's evanescent memory. . . .

THEO. . . . This is the real Individuality, or the divine man. It is this Ego which . . . made of that human-like form a *real* man. It is this Ego, this "Causal Body," which overshadows every personality into which Karma forces it to incarnate; this Ego which is held responsible for all the sins committed through, and in, every new body or personality—the evanescent masks which hide the true Individual through the long series of rebirths.

INQ. But is this just? Why should this Ego receive punishment as the result of deeds which it has forgotten?

THEO. It has not forgotten them; it knows and remembers its misdeeds as well as you remember what you have done yesterday. Is it because the memory of that bundle of physical compounds called "body" does not recollect what its predecessor (the personality *that was*) did, that you imagine that the real Ego has forgotten them? As well say it is unjust that the new coat on the back of a boy, who is flogged for stealing apples, should be flogged for that of which it knows nothing. . . .

THEO. Has the coat torn to shreds from the back of the man who stole it, by another man who was robbed of it and recognizes his property, to be regarded as fairly dealt with? The new "personality" is no better than a fresh suit of clothes with its specific characteristics, color, form and qualities; but the *real* man who wears it is the same culprit as of old. It is the *individuality* who suffers through his "personality." And it is this, and this alone, that can account for the terrible *seeming* injustice in the distribution of lots in life to man.—H. P. Blavatsky, in *The Key to Theosophy*.

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

The Realities of Life

IT may truly be said that the mission of Theosophy is to bring people back to a sense of the realities of life. This statement may sound a little startling to those who may have imagined Theosophy to be something visionary—and there have been such even among the ranks of those calling themselves Theosophists. Nevertheless the statement is made in all seriousness, and may be regarded as defining what Theosophy stands for in the minds of a more earnest class of Theosophists.

It is true that people are in the habit of relegating their religion (as they call it) to the sphere of fancy and pious reflection, thus making it unreal; so that by contrast with this unreal religion, the ordinary mundane concerns of life appear comparatively real. It is true that many of our highest ideals are apt to remain ideals still, with no immediate prospect of becoming realities; even our love for our neighbor resembling that of

The Sluggard Pity's vision-weaving Tribe,
Who sigh for Wretchedness, yet shun the wretched,
Nursing in some delicious solitude
Their slothful loves and dainty sympathies.

Coleridge

And if this be people's conception of Theosophy, then that Theosophy is indeed concerned with unrealities. Yet such was not the conception of the Founder of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, H. P. Blavatsky, as her life testifies. Her life was a perpetual sacrifice, of comfort, position, reputation, everything the world can give, to her mission. Nor was such the conception of William Q. Judge, her successor, nor is it that of the present Leader of the Theosophical Society, Katherine Tingley, under whose Leadership the Society has been wisely guided along the lines intended by its Founder—those of the most powerful agency for uplifting humanity now on the earth.

The unreality of the affairs of daily life has been the perpetual theme of poets and wise men. The result of a plentiful experience of life is to convince the reflecting individual of the illusoriness of all the usual objects of pursuit. It is a perpetual disillusionment, as we discover that one thing after another mocks us and falls short of the goal we have been striving for. The so-called realities of life are not realities; they are illusions because they

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

do not fulfil the promise which their appearance led us to expect; they cheat our faith.

False religious teaching has encouraged man in his despondency by telling him, "Yes, this world is all a fleeting shadow; there is no reality or blessedness this side of the grave." It is this false religious teaching that Theosophy aims to dispel and to replace by a truer, nobler religion—a religion which the world had before it fell into the darkness of superstition and dogmatism.

Getting and spending, we lay waste our powers;
Little we see in Nature that is ours;
We have given our hearts away.—Wordsworth

And so we have lost the power to see and the power to enjoy what is in the world. We are like moles, all unconscious of the sun and air and flowers. And we say there is nothing there because we cannot see it and feel it. But some have had hours when their inner senses were unsealed.

It seemed like Omnipresence! God, methought,
Had built him there a Temple: the whole World
Seemed imaged in its vast circumference.
No wish profaned my overwhelmed Heart.
Blest hour! It was a Luxury—to be!

O the one life within us and abroad,
Which meets all motion and becomes its soul,
A light in sound, a sound-like power in light,
Rhythm in thought, and joyance everywhere—
Methinks it should have been impossible
Not to love all things in a world so filled.

Coleridge

Wordsworth, in his *Intimations of Immortality*, speaks of the Child as

Thou, whose exterior semblance doth belie
Thy soul's immensity;
Thou best philosopher, who yet dost keep
Thy heritage, thou eye amongst the blind
That, deaf and silent, read'st the eternal deep,
Haunted for ever by the eternal Mind—
Mighty Prophet! Seer blest!
On whom those truths do rest
Which we are toiling all our lives to find.

And the poet wishes he had the vision of a Pagan, that he might see

Proteus rising from the sea;
Or hear old Triton blow his wreathed horn.

There was a time when these classical myths meant no more than a faded superstition; but there was a time when they stood for sublime realities. We no longer feel mighty Presences in Nature, thrilling our soul with responsive powers. Our science scrutinizes the external forms of things and spins webs of dry mechanical theory; but the inner

agencies, the joyous life, the sparkling intelligence, the wondrous harmony, of Nature it perceives not. It has been left for poets to get occasional glimpses and to convey them to us in broken words.

Yet heaven is all around us, not only in our infancy, but all the time. But human faculty has lost the power to perceive it. We live in a world of shadows and reflections, the realities corresponding to which are out of our sight. Theosophy aims to bring us back to a knowledge of those realities. It proposes to show man a purpose in life that will not continually mock and elude him. Back of all the natural forces which science studies lie the conscious intelligences that operate in Nature, which ancient peoples have known of and revered, but which to us are mere fables. And back of the ideals and yearnings which we perforce cherish, but which we vainly seek where they are not to be found, lie the realities of the Inner Life where these ideals are realized. That mysterious principle called "Love" is sought in vain among the passions and sentiments. Mistaking the flame for the Sun, we only singe our wings. The source of Love is higher, deeper, remoter. It can find no abiding place where there is still a tinge of selfishness. So, for the unenlightened and the unemancipated, it remains a mocking vision; but it can be realized in all its beauty by those who will rise to the plane of impersonality and make their own lives a manifestation of its generous influence. And there are many more realities which in the world are represented only by illusions. The realities are the riches of the Soul, such as cannot be taken away, even by death. STUDENT

It is the priesthood which has to be held responsible for the reaction in favor of materialism of our day. It is by worshiping and enforcing on the masses the worship of the shells . . . of pagan ideals, that the latest exoteric religion has made of Western lands a Pandemonium.—H. P. Blavatsky

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

LAST Sunday evening at Isis Theater, great interest was shown by the audience in the whole program. The music which was provided by the Rāja Yoga Quintet, including a violin solo, was, as always, charmingly rendered, awakening a sense of the deeper harmonies which are so often missing from what are technically the most finished and artistic performances.

After a very interesting paper on Happiness by Iverson L. Harris Jr., one of the Rāja Yoga students, in which he divided mankind into great armies seeking happiness, one by selfish means and for the gratification of self, and the other by seeking the welfare of others and following out the higher ideals of life, Mrs. Marjorie M. Tyberg spoke on the subject of The Human Personality — the Use and Misuse of its Powers. She described the personality as the guise which we wear from birth to death in any one life. It is not the real self, but if we regard it as such, and center our consciousness wholly in it, directing our energies to the gratification of its desires, with interests separate and generally conflicting with those of all other human beings, this personality will become an end in itself and effectually bar the entrance into the mind of high aspirations or ideas of universal application. It is of course a case of mistaken identity. Man is not the personality, but the soul which has lived through many lives and gained experience through many personalities.

The personality is the guise or mask assumed for one life only. It is made up of elements which we have used before in past lives, and which return to us, on the occasion of our reincarnating, with the mark we have put upon them in the past. In our personalities we face the past, we are what we have made ourselves. The very mask we wear from birth to death is of our own creation.

The use of the personality is as an instrument of the real inner man, the Soul. The recognition of oneself as the soul who lives throughout the long cycle of human births is the first step towards the correct use of the personal powers. It is the beginning of the mastery of the nature by one who is the true master. Theosophy teaches man the truth about his own nature and the use of each aspect of that nature; it teaches him to regard the personality as the means by which the inner divine nature can express itself on the outer material plane, a vehicle constantly to be purified and uplifted, so that at last through it may shine the light of the soul. This constant setting of the mark of the god-like nature upon the guise of the soul will gradually build a personality that can reflect the god within. This is the right use of the personality. The misuse of it is the indulgence of low desires, absorption in selfish interests, and the setting of it up as a separate entity. To know what is the true man, what the personality, and the right relation between them we must turn to Theosophy. OBSERVER

Brotherhood and Higher Powers

THE word "brotherhood" has for the Theosophist a meaning quite different from what it ordinarily has. Ordinarily it stands for an amicable state of society, in which the advantages of co-operation are substituted for evils and everybody secures a fair share of the good things of this world. Also the result is usually confounded with the cause, and people fail to realize that the fraternal condition which they propose to bring about must have an adequate cause or moving spirit to create and maintain it. The spirit of brotherhood will bring about the condition of brotherhood, and people try to bring about the condition without having the spirit. Besides this, the condition of social amicability and equitable economic distribution does not in itself constitute a final and satisfying ideal for mankind, and it therefore leaves unemployed

In short, the object of brotherliness, for the Theosophist, is to create the conditions for a higher and fuller realization of life, to bring new powers and faculties into operation, to raise man from his present semi-animal condition to a fuller realization of his innate Divinity. What object do people in this connexion usually have? As a rule they have no object higher than that of maintaining a peaceful order of society; and sometimes there is a religious idea as well. Their aspirations may run to the extent of imagining a better condition of health and physical perfection, but the notion of evolving a higher type of humanity in the truer sense does not enter into the calculation.

Yet the great Teachers have ever proclaimed the possibility of attaining a higher state of life, and have urged brotherliness as the necessary condition therefor. But the "Christ-

Lomaland Photo. and Engraving Dept.

TOM TOWER, CHRIST CHURCH COLLEGE, OXFORD

and unsatisfied many of the strongest instincts of human nature. For these reasons Utopian schemes for the establishment of fraternal communities have always proved futile.

The meaning of brotherhood in the mind of a Theosophist may be illustrated by comparison with an orchestra. Let each human individual be represented by a particular musical instrument. Conventional ideas of brotherhood aim to make all play the same instrument, or to make all play in unison. Theosophy aims to produce an orchestra, in which each plays a different instrument and a different score, but all play in harmony and rhythm. The principle involved is this — that out of a harmony of many diverse elements there is created something which none of the elements could have attained separately. And so, from a harmonious co-operation of human individuals, may spring into being a new life in which all share, but which is impossible for any one without that co-operation. A deeper reality is born.

life," though a term that is sometimes used, does not ordinarily imply a high or desirable state; it usually stands for religious exaltation or piety.

The fact is that the churches do not possess the keys of the Kingdom of Heaven, and so they cannot unlock the gate for humanity. Although they are desperately concerned to maintain their title to supremacy and the justification for a continuance of their existence, yet they are unable to inspire us with any ideal or motive that is competent to infuse us with a new vitality and lead us on to higher things. And equally in vain do we look elsewhere for an inspiration. Aside from Theosophy, we find only the earnest groping for illumination and the various movements that are daily being started in the futile attempt to supply it.

But Theosophy has behind it its vast and sublime teachings, the heritage of the ages, which lead the mind on to new and broader conceptions of human nature, harmonize the

contradictions of life, explain the vexed problems of science, reveal the true meaning of religion, and inspire us with a rich and undying enthusiasm for the cause of perfection. The Theosophist knows that there are spiritual powers in man, and that brotherhood is the condition of their realization.

The usual principle of education is "Me first"; the idea of looking after Number One is carefully instilled from the outset. The result is an over-cultivation of the personality—that is, of the inferior parts of human nature—whereby humanity is the loser, both collectively and individually. The opposite principle is that of "Others first"; and by instilling this principle of conduct from the outset, we develop the superior parts of human nature, and the community gains both individually and collectively. New powers and faculties unfold in the individual, faculties whose development was previously prevented by selfishness.

The great importance of this is that our entire view of the prospects and possibilities of humanity in the future is changed. We no longer confine our anticipations to the imagining of a state of mere peaceful and evenly-distributed enjoyment of the produce of the soil and the pleasures of culture, though these may come incidentally. Our efforts are directed to the attainment rather of the spirit and motive than of the outward effects. It is the *spirit* of brotherhood that should be sought. Selfishness and folly are the causes of woe and can only be overcome by the growth of some other and overmastering incentive. But unselfishness is not the mere absence of selfishness, which would be a negative quality; it is itself the positive quality, and selfishness is the absence of it.

In the present state of our development, each one of us imagines himself to be the center of the universe. In imagination and feeling we are self-centered, and this condition causes each one naturally to think of himself first. But suppose it is possible to transcend that condition and to become aware of the existence of another force within us, a force impelling to act in the general interest instead of in our own. Suppose we can become conscious of the possession of a broader life than that which we now feel in our bosom, a life which seems to link us up with all creation and merge our personality into the general life. And suppose that this new Life is joy and peace and liberation and light. Would not that be a Gift of the Spirit? And is not this, perhaps, what the old disciples meant when they spoke of Gifts of the Spirit, and what Jesus means when he speaks of the Kingdom of God?

To awaken the Soul in humanity, then, is the Theosophical idea of brotherhood; and with the awakening of the Soul will come new Light. Many are feeling this truth dimly and their earnestness inspires them to various attempts to live the Christ-life and get in touch with the "All," etc. But such efforts are futile unless grounded on a broad and far-reaching philosophy of life, such as is comprised in the Theosophical teachings. In Theosophy, philosophy and ethics go hand in hand, being mutually indispensable. It is the ancient Wisdom-Religion, of which modern creeds and sciences are but the dim reflections, and these mainly in brain-consciousness only. STUDENT

How to be a Blissful Prophet

FROM a Boston paper one learns that a "new cult" has arisen, "The Eternal and Universal Brotherhood of Mystics." "Blissful Prophets," says the journal, are at the head of it, issuing at regular intervals the teachings, "which, when followed, are declared to enable members to accomplish wonderful things." Reading on, in order to ascertain the nature of the wonderful things, appears this paragraph:

Some mystics, it is claimed, by such practices as long continued suppression of the respiration, inhaling and exhaling the breath in a particular manner, sitting in 84 attitudes, fixing the eyes on the tip of the nose and endeavoring by force of mental abstraction to unite themselves with the vital spirit which pervades all nature, are able to make themselves lighter than the lightest or heavier than the heaviest substance, or as small or as large as they please.

But the mere neophyte must not aspire too high; he is recommended to remain content with his present weight and size:

The adepts do not, however, advise attempts on the part of all members to reach this extreme state.

In good time they will come to it; they are, apparently, irrigated from all quarters so as to ensure their growth. They are assured that at the noon hour "The Word" is spoken for them. "The Holy Spirit and the angels and mighty mystic adepts are trying to help you each day at noon." They have another try at night, and in addition the guardian angel lends a hand. At night

Commend yourself entirely to your guardian angel and the unseen powers and you will be cared for in your sleep in a mystic way that will be most blessed. Remember each night the mystics who care for the eternal sacred roll are fervently caring for you and all names on that blessed eternal roll; and great and mighty angels are helping you and them in this blessed work.

But you must be on "the blessed eternal roll" to get all that work done on you; we do not read that "the mystics" are bothering about the rest of humanity. No meat must be eaten; it seems to be bad.

No man whose body is poisoned with flesh meats or poisons can see or hear the angels; they approach only pure white auras, in the pure white light.

This, says the journal, is from the text-book. There is to be a colony on the banks of the Penobscot, in Maine; but notwithstanding their association the members will live in sorrow and loneliness. That appears to be the condition of learning how to fool with the scale pan and the yard measure.

We only work wonders in the world after we wed the Silent One in love after sorrow and loneliness.

But one wonders, after all, how poor humanity is to get its name on that eternal blessed roll, whether the angels and the Holy Spirit and the mighty mystic adepts and blissful prophets and guardian angels and Silent Ones do not occasionally turn an eye on to the four thousand millions who will not be able to get to the Penobscot. H. C.

ON June 17 this year the sun will rise totally eclipsed in the south of Tomsk, Russia, and set totally eclipsed at the south of Greenland. It will be a partial eclipse throughout China, Siberia, and North America. J.

Sovereign's Declaration

MR. GLADSTONE'S VIEWS

To The Editor of *The Daily Telegraph*

SIR:—Father Bernard Vaughan asks, according to your report of his recent sermon on this subject, why Roman Catholics should be singled out for exceptional treatment? The late Mr. Gladstone answered the question thirty-four years ago in his pamphlet on "The Vatican decrees in their bearing on civil allegiance."

Mr. Gladstone wrote: "That the Pope of Rome had been, and was, a trespasser upon ground which belonged to the civil authority, and that he affected to determine by spiritual prerogative questions of the civil sphere. This fact, if fact it be . . . is the whole and sole cause of the mischief. . . . All other Christian bodies are content with freedom in their own religious domain. Orientals, Lutherans, Calvinists, Presbyterians, Episcopalians, Nonconformists, one and all, in the present day, contentedly and thankfully accept the benefits of civil order; never pretend that the State is not its own master, make no religious claims to temporal possessions or advantages; and, consequently, never are in perilous collision with the State. Nay, more, even so I believe it is with the mass of Roman Catholics individually. But not so with the leaders of their Church, or with those who take pride in following the leaders. Indeed, this has been made matter of boast:

"'There is not another Church so-called' (than the Roman), 'nor any community professing to be a Church, which does not submit, or obey, or hold its peace, when the civil governors of the world command.' (*The Present Crisis of the Holy See*, by H. E. Manning, D.D., London, 1861, p. 75.)

"The Rome of the Middle Ages claimed universal monarchy. The modern Church of Rome has abandoned nothing, retracted nothing. Is that all? Far from it. By condemning (as will be seen) those who, like Bishop Doyle, in 1826, charge the medieval Popes with aggression, she unconditionally, even if covertly, maintains what the medieval Popes maintained." (*Vatican Decrees*, pp. 10-11.)

The fact is, the authorities of his own Church have answered the question put by Father B. Vaughan, and we may well ask him whether the Bulla "Coenae Domini" does not establish the Ultramontane doctrine that both bishops and priests, in his communion, look on the laws of England, or ought to do, so far as they are concerned, as laws which they have no conscientious obligation to obey? Mr. Gladstone says of the convert to Rome that he renounces "his moral and mental freedom and places his civil loyalty and duty at the mercy of another."—Yours faithfully, James Maden Holt

Stubblee, Bacup, Dec 22

(From the *London Daily Telegraph*, Dec. 25, 1908)

IF from an injury or from any cause, a Christian Scientist were seized with pain so violent that he could not treat himself mentally,—and the Scientists had failed to relieve him,—the sufferer could call a surgeon, who would give him a hypodermic injection; then, when the belief of pain was lulled, he could handle his case mentally. Thus it is that we "prove all things; (and) hold fast that which is good."—*Science and Health with Key to the Scriptures*, 1908 edition, page 464; lines 13 to 20

Thus it is that we are to prove all things and hold fast to that which really does the work.

Incantations, said Voltaire, are good against rats—when accompanied with rat poison. By all means incantate, but don't forget the other thing.

We must confess to an ignoble desire to know whether in such case as the above the fees of the "Scientists" who fail are turned over to the mundane surgeon (no capital "s" here) who succeeds? H. A. W. C.

Art Music Literature and the Drama

The Centenary of Edgar Allan Poe

ON January nineteenth last was celebrated in various cities the hundredth anniversary of the birth of Edgar Allan Poe. The room which he occupied while a student at the University of Virginia was on that date opened as a museum. Faculty and students of Johns Hopkins University, Baltimore (the city in which Poe died) held a special memorial celebration, the principal speaker being the Hon. John P. Poe, a prominent Maryland attorney and the poet's only living relative. At the little cottage in Fordham where Poe's wife died and where the bitterest agonies of a hard and agonizing life were endured, a tablet to Poe's memory was unveiled, and special celebrations were held in Boston, the city of his birth, in Providence, and in many other cities.

It were high time. Perhaps no one, with the single exception of Thomas Paine, has in this enlightened day been more outraged by the wilful mis-statements of early biographers, than was Edgar Allan Poe. He was pictured as half-insane, erratic, and a dipsomaniac, whose poems and stories were thrown off at fever heat in the intervals of gross debauchery. He was *persona non grata* in decent society (!) and (how this reminds one of the account of Paine's death-bed recantation, which the inventor later admitted he was paid \$80 to write) at least two generations have been piously shocked at the account of how Poe was found dying in the gutter, having fallen there because intoxicated!!

Naturally, these outrageous falsehoods were resented by the prominent literary men and women who knew Poe best in life — Nathaniel P. Willis, among the number — and the result was a searching scrutiny of all available facts, to the poet's lasting vindication. But we all know how long Truth is in catching up with a lie that has once got two hours ahead. So widely spread were these disgraceful fictions that few are not even now psychologized by them to some degree and not to refer to them, in sheer justice, is impossible.

Poe stands beside Hawthorne as one of the greatest romancers in prose, one of the greatest masters of style, that America has yet produced. As a poet he is more thoroughly poetical, more musical, more mystical than any. As a man he was more misunderstood, more unappreciated and more sensitive to suffering than any other figure in our permanent literary history. Instead of being an erratic genius, those who knew him, who employed him, who worked with him, tell us that he was regular, punctual, and absolutely reliable. Instead of his writings being "dashed off," after the pose of the mediocre, they were the result of the hardest, most severe and disciplinary, and most painstaking work. Instead of his having been born with the gift of romancing in prose and singing in verse on the end of his pen, ready to be employed at any time without effort. Poe won his gifts through the severest of scholastic training, the closest and most careful study of the great masterpieces, ancient and modern, and the most persistent literary toil.

Stanzas from ULALUME

... HERE once, through an alley Titanic
Of cypress, I roamed with my Soul —
Of cypress, with Psyche, my Soul.
These were days when my heart was volcanic
As the scoriac rivers that roll —
As the lavas that restlessly roll
Their sulphurous currents down Yaanek
In the ultimate climes of the pole —
That groan as they roll down Mount Yaanek
In the realms of the boreal pole.

And now as the night was senescent
And star-dials pointed to morn —
As the sun-dials hinted of morn —
At the end of our path a liquescent
And nebulous lustre was born,
Out of which a miraculous crescent
Arose with a duplicate horn —
Astarte's bediamonded crescent
Distinct with its duplicate horn.

And I said — "She is warmer than Dian:
She rolls through an ether of sighs —
She revels in a region of sighs:
She has seen that the tears are not dry on
These cheeks where the worm never dies,
And has come past the stars of the Lion
To point us the path to the skies —
To the Lethæan peace of the skies —
Come up, in despite of the Lion,
To shine on us with her bright eyes —
Come up through the lair of the Lion,
With Love in her luminous eyes."

But Psyche, uplifting her finger,
Said — "Sadly this star I mistrust —
Her pallor I strangely mistrust:
Oh, hasten! — oh, let us not linger!
Oh, fly! — let us fly! — for we must."
In terror she spoke, letting sink her
Wings till they trailed in the dust —
In agony sobbed, letting sink her
Plumes till they trailed in the dust —
Till they sorrowfully trailed in the dust. . . .

Edgar Allan Poe

As a school-boy and collegian Poe was noted for his skill in athletics, and was, says an old school-friend,

a swift runner, a wonderful leaper, and would allow the strongest boy in the school to strike him with full force in the chest. For swimming he was noted. . . . In our Latin exercises at school Poe was easily first. He was very fond of the Odes of Horace and repeated them so often in my hearing that I learned by sound the words of many before I understood their meaning. In the lilting rhythm of the Sapphics and Iambics, his ear took special delight. . . . I remember Poe also as a very fine French scholar.

So wholesome and strenuous a youth to blossom into an ignoble and erratic later life!

From his father Poe received the inheritance of a legal and trained mind; from his mother, an actress and a woman equally noted for her beauty and her virtues, his charm and beauty of manner, his great natural refinement, a love of the ideal and a passion for and rare understanding of music. For Elizabeth Arnold was a brilliant musician, her premature death having been brought about by the struggle to maintain and care for her three little children, early left fatherless, and of whom Edgar Allan was the second.

Over-indulged in childhood and early youth

by the wealthy Scotch merchant who adopted him after his mother's death, Poe was not prepared for the world's heartless unconcern when he later tried to support himself by his pen. For one of his best-known volumes, which early reached a sale of tens of thousands, the sole remuneration received by Poe was a few copies of the work! For *The Raven*, which "made him the literary lion of the season, was translated into various languages, and created a literature of its own," he received ten dollars. Every journal for which he ever wrote his matchless stories, several of them moribund when he became a contributor, shortly leapt into fame as important, respected, and among the most profitable periodicals of the day — and all through his brilliant and never-failingly resourceful pen. Yet all that he could earn in those early days, by the most exacting and regular work, was but a few hundred dollars a year, and when his idolized wife lay dying he had not the means to procure her needed comforts.

Poe's adoration of his beautiful, frail young wife need not be dwelt on here. Her death nearly killed him, "and for some time afterward he remained in an apathetic stupor. It may be truly said that never again did his mental faculties appear to regain their former power."

William Wilson, *The Fall of the House of Usher*, all of Poe's Prose Poems and Essays, *The Bells*, *The Raven*, *Ulalume*, *Al Aaraaf*, and others — our chiefest literary monuments of their kind they will remain. To the soul which guided that inspired pen, sore-tried, sensitive, proud, gifted, sincere, with a heart passionately responsive to affection, one were callous not to offer buds of remembrance, sweet incense and ivy, the wreath and the laurel — for what was striven for even more than for the music that was achieved.

STUDENT

The Drama of Truth and Philosophy

THE drama that gives us truth and philosophy, such as those ancient sacred mystery-dramas revived by Katherine Tingley — of which *The Eumenides* was the first — and those now being written under her direction, are of the sort that are immortal. For they are woven of the imperishable warp of a knowledge of man's true nature crossed by the divine and changeless woof of a knowledge of the higher laws of destiny and of life. The final web shall fade not, neither can it change nor pass, nor can moth or dust corrupt it. It is now in the weaving, and, if signs mistake not, there is now in the hearts of men generally the promise, the germ only as yet, of an awakening which shall make them able to distinguish between the real in life and the unreal, the true coin in drama and the counterfeit. Though mid-noon is far from being at hand, the first faint rays of light that precede sunrise are assurance of its coming to one who knows the cyclic march of the days. Only the ignorant are pessimistic, saying, "True drama is lost and dead." Those who know philosophy know that it is even now returning to claim its birthright. STUDENT

There are external and internal conditions which affect the determination of our will upon our actions, and it is in our power to follow either of the two.—*Helena Petrovna Blavatsky*

EVERY visitor to the British Museum must have been struck by the beauty and magnificence of a royal throne carefully preserved under a glass case in the upper Egyptian gallery. Although it is unfortunately incomplete, the seat and back having disappeared, there is plenty to command the highest admiration. The framework is made of a rich, dark, red wood, very heavy and strong. The legs are shaped like those of some animal, and some of the decoration is of light-colored wood, but the chair is heavily plated with gold and silver for the most part. The asp is the principal motive of the design of the plating. We are fortunately able to tell the name of the Pharaoh to whom this exquisite example of ancient art belonged, for it bears the royal cartouche of Queen Hatsu, or Hatshepsu as she is sometimes called, one of the great women of history.

This relic is particularly interesting because so few personal remains of this sovereign exist. Though her mummy has been searched for many times during the past sixty years—since the time when her supposed grave was found empty—it is only within the past few years that it has been found in a quite unexpected place in the valley of the Tombs of the Kings. Three great chambers were opened in the limestone cliffs before the two ponderous sarcophagi were discovered containing Hatsu's mummy and that of Thothmes I, her father. This important find is due, says the *London Times*, to "the lavish expenditure and American tenacity of Theodore M. Davies."

From the records that have come down to us it is clear that Hatsu was an extraordinary character, one of the most, if not the most, daring and original innovators among Egyptian Pharaohs. She has aptly been called the "Queen Elizabeth of Egypt," for among other qualifications for the title, it was under her direction that one of the most adventurous trading and exploring expeditions of the ancient world was carried out. Besides being the daughter of Thothmes I and the wife of

A Great Egyptian Queen

Thothmes II, by whom she had two daughters, she had hereditary rights to the throne from her mother's side, and when her husband died she reigned alone for sixteen years. The Eighteenth Dynasty of Egyptian kings, to which she belonged, is generally placed at about B. C. 1580.

When Queen Hatsu assumed sole control she adopted the titles and style of the Kings, even to the costume, the war helmet, and the false beard! But in spite of this formidable appearance, or perhaps in consequence of it, her reign was one of profound peace: her triumphs were those of Art, Science and Commerce.

Her portraits (of which we have several) are just what might be expected; they show a cheerful, handsome and intellectual face, full of life and character. She restored many shrines and temples, and particularly enriched the great temple of Karnak. In front of the fourth Pylon she put up the two largest obelisks ever made in Egypt, red granite shafts 109 feet high. One has fallen. These enormous monoliths were cut out of the living rock, carved, polished, and brought down from Syene in the remarkably short space of seven months. Could we do as much today in the time?

But Queen Hatsu's most wonderful architectural feat was the building of the perfectly original temple of Deir-el-Bahari, on the west bank of the Nile, nearly opposite the Great Temple of Karnak. Taking advantage of the peculiar nature of the site—a great natural theater hemmed in by high cliffs—she caused the temple to be built in terraces, each one being at a higher level than the last; hundreds of sphinxes in rows, splendid colonnades, and immense flights of steps, added dignity to the effect; and finally, at the height of five hundred feet above the Nile, the more sacred rooms and the Holy of Holies were excavated

from the solid rock at the back of the theater. The name of the architect has been preserved, Sen-Maut, an unusual tribute probably called forth by the originality and genius shown in the design. It is greatly to be regretted that the temple is in a ruined state; but fortunately a magnificent series of sculptured and painted scenes remain upon the upper walls, illustrating in great detail the expedition which Queen Hatsu dispatched to the mysterious land of Punt, now believed to be Somaliland in eastern Africa. The temple was dedicated to Amen, the special deity of Thebes, and to Hathor (a form of Isis), Lady of the West, who was, oddly enough, supposed by the Egyptians to be the Deity of Punt.

The principal object of the daring expedition to Punt was to obtain materials for making the sacred incense of the temples, but the captain seems to have had a roving commission to get as many curiosities as possible.

The series of pictures begins with the starting of the expedition, which consisted of five ships and 210 men. The voyage itself is not represented, but the arrival at Punt and the reception by the King and royal family are given with realistic detail, even to the rather unprepossessing features of the queen. The Punt royal family was not black, though the queen strongly resembles the famous "Hottentot Venus" in figure! Queen Hatsu had sent handsome presents to the King of Punt, and in return the ships are laden with a marvelous variety of curiosities, including monkeys, elephants, giraffes, dogs, panther hides, tusks, ebony, gold, thirty-one myrrh-tree saplings, quantities of aromatic gums, and several natives. A grand banquet in the Egyptian style was given by the officers of the flotilla on their departure, but we find no representation of the return voyage. Perhaps it was uneventful!

The series closes with the grand reception in Egypt, in which Hatsu is seen in great state congratulating the successful adventurer-

ers and examining the strange beasts and other curiosities.

An important question has arisen in connexion with this voyage. How did the ships get to Punt if they started from the Nile? To do so they would have had to circumnavigate nearly all Africa. The pictures prove that the start was made from the Nile, and yet it was a thousand years before the Egyptians made their first voyage through the Pillars of Hercules and around the Cape. Must not Queen Hatasu's navigators have reached the Red Sea by some short cut? It is known that some time after Hatasu's day a branch of the Nile which then reached the Red Sea was in a canalized and navigable shape, and Seti I has had the credit of this great engineering feat, but the fact that the Punt expedition required such a communication makes it almost certain that it was open already in the time of the good and great Queen Hatasu.

A STUDENT OF ANTIQUITY

The Trend Upwards

THE future kings and queens of Europe are being brought up in an almost Spartan simplicity, their child-lives being bounded by study, work, and a very real self-denial. Surely their royal parents set an example to that class called in America as well as Europe the *nouveau riche*, whose children are so universally spoiled by unwise training and indulgence. Fortunately for America it is not a very large class as yet.

But Queen Victoria set royal mothers a royal example, or rather we might say that her own mother did before her, for the little Victoria was brought up in a manner most simple, her life filled with wholesome occupation for head, hand and heart, and quite destitute of the unwholesome stimuli one so often associates with the environments of wealth or position. Doubtless because of her mother's influence and example the Queen's own sons and daughters were brought up under her personal supervision and most sensibly and unostentatiously. These in turn followed, and today among the most devoted and judicious mothers in Europe are the Queen's granddaughters, Queen Maud of Norway, Queen Victoria of Spain, and the Crown-Princess of Roumania. The latter, who has wholly conquered the hearts of her foreign subjects by her superb qualities as a woman, is the happy mother of four children, all healthy, bright, and filled with ideas of future helpfulness to humanity.

The devotion of the Czarina as a mother is well known, and her greatest happiness is to be with her five children. She superintends not only their education but their daily régime, insisting that they be dressed sensibly, that their food be of the simplest, with an entire absence of the needless luxuries that in so many well-to-do families are counted in among the necessities. The present Princess of Wales is another example of motherly wisdom and devotion. She superintends her children's lessons daily, their walks, their hours of recreation and fun, and looks after their diet personally with as much care as if she were physician as well as mother.

In Germany it is the same, simple food, simple pleasures, plenty of study and plenty of work. Both Emperor and Empress are

agreed that the royal road to their children's future usefulness is the life that is wholesome, happy, simple, yet strenuous and with plenty of room for self-denial of the right kind—the life that we sentimentally associate with the much-lauded “middle-class,” but which, as a matter of fact, is not especially characteristic of that class.

The influence of examples such as these must be incalculable. Considering the faults and inadequacies of modern-day education, the best of it, the result can only approximate the ideal; but even then how much does this not mean for Europe in the future! Not only will these children, all of whom will be influential in a very marked degree, bring into their life-work of later years an unwonted share of mental and moral poise, competency,

and strength, the growing general refusal to shirk one's duty. One might paraphrase H. P. B.'s saying thuswise, and not far miss the truth: “We must first regenerate the mothers of the race before we can hope to regenerate the homes.” With the mothers in line, loyal to their highest ideal, alert to safeguard from evil and to encourage on lines of good, the fathers will step into their real places as warrior-guardians of the home, no longer content to be mere providers of its material needs. Then, when true ideals of education, made practical as is now the case in the Râja Yoga Schools and Academies being established by Katherine Tingley, are brought to the attention of earnest fathers and mothers, they will be ready to appreciate them, fitted to receive them. And there will be homes

Sr. Manuel Rendueles third from the left, Mr. Torsten Hedlund in center, and
Mrs. K. Richmond Greene, sitting

skill and brotherliness, but their influence on all classes below them will act as a general leaven. It cannot help but be so, and recalls H. P. Blavatsky's saying, “We must first regenerate the rich ere we can hope to regenerate the poor.”

Looking back over history we find great and wise mothers, such as Maria Theresa of Austria and Queen Isabella of Castile, but these are one, perhaps two, in a single generation. Today the mother of royal birth who contentedly resigns her prerogatives to hired hands, no matter how competent, is scarcely to be found. And while it may be argued that no mother can have the wisdom of a Solomon, a Hippocrates, a Cornelia, all gathered into her one brain, and that in many cases the services of a skilled physician or an educator of long training must be far more valuable than her own, that is not the *crux* of the matter. The point to be emphasized is the growing general feeling among mothers of *personal responsibility*, the growing willingness to rely on mother-intuition and the woman's true tact

where the true ideals can take root and grow.

In spite of the sin, vice and misery of the age, in spite of the arrogance, the persecution, the wilful wrong-doing and unbrotherliness, there are indications of the growing of better things. The effort towards commonsense and simplicity in royal families, though as yet little more than an indication, yet shows unfailingly the trend of one life-current and that it is upwards.

STUDENT

In an old Spanish volume (published in 1510) occurs a passage, which, translated, reads as follows:

H. H.

Know that on the right hand of the Indies there is an island called *California*, very near to the Terrestrial Paradise, which was peopled with black women without any men among them, because they were accustomed to live after the fashion of Amazons. They were of strong and hardened bodies, of ardent courage and of great force. The island is the strongest in the world from its steep rocks and great cliffs. The arms of the women were all of gold, and so were the caparisons of the wild beasts which they rode after having tamed them; for in all the island there is no other metal but gold.

OUR YOUNG FOLK

George Washington

(Feb. 22, 1732—Dec. 14, 1799)

THE year 1732 always suggests the birth of this illustrious soldier and statesman. His grandfather, a brave English gentleman, had emigrated to America seventy-five years before. A man of education and high principles, as well as a valiant soldier, it was not long before John Washington was taking an active part in colonial affairs. His sons and grandsons in their turn kept alive the family traditions, being brave and loyal, and serving Virginia as ably as their ancestors had served the mother country.

Until he was twelve years old, George Washington led the life of a healthy, energetic school-boy, excelling in out-of-door sports and growing tall, strong, and fearless. Then his father died, and an awakening and serious thoughts came to the hitherto care-free boy; for although there was a large landed estate bequeathed to the family the fortune left for the support of Mrs. Washington and her five young children was but small. So George felt, that as the eldest son, the great responsibility of taking care of the family fell to him, and that he must choose a career. His heart turned to the sea, and he confided his wish to enter the navy to his elder half-brother Lawrence, who succeeded in securing him a midshipman's berth. George's kit was already aboard ship and he was just about to follow it when a message came from his mother importuning him not to go to sea. He yielded to her rightful authority and returned home. What great issues hung upon that simple act of obedience! It put George Washington, then only fourteen years old, in line with the opportunities that prepared him for his great life of patriotic service.

Upon his return to school, to mathematics George added the study of surveying. Every moment was henceforth precious to him. He no longer joined his comrades in their sports but sat patiently poring over his books during recreation time. Nevertheless he did not lose interest in his school-fellows, and to quiet, thoughtful George in the schoolroom they brought all their disputes, sure of his impartial judgment, his knowledge, and his sympathy.

A much worn copy-book belonging to this period of George Washington's life may still be seen. In the orderly rows of figures evenly and correctly set down; in the carefully written copies of bills, receipts, bonds, and other business documents, one may see how carefully he trained himself in his youth in that painstaking attention to detail and method and

THE BASE OF THE EIFFEL TOWER, PARIS

FRAGMENT

A NOBLE soul is like a ship at sea,
That sleeps at anchor when the ocean's calm;
But when she rages and the winds blow high,
He cuts his way with skill and majesty.

Beaumont and Fletcher

system in his work which enabled him in manhood to carry on practical affairs, whether of his estate, of war, or the government, so successfully.

In this same copybook are set down those one hundred and ten maxims of civility and good behavior that young Washington took for his standard. They are based upon the deep moral principle of consideration for others, and he demanded of himself that he should live up to them. So completely did he exemplify their teaching, that until recently it was thought that the maxims were of Washington's own composition; but now it is known that they were the flower of the fine courtesy and chivalry of France, admonitions set down for the character building of her youth. They gave to the boy born in the Virginia woods—because he opened his mind and heart to their influence, and exerted his strong will—that wonderful dignity of bearing which won for him the esteem and recognition of all, even of foreign countries, when their support was needed in the struggle for independence.

His school days over, George Washington, then sixteen, visited his brother Lawrence at Mount Vernon. Soon his modesty and gentle

bearing won him the notice of his brother's wealthy and influential friend and neighbor, Lord Fairfax. His knowledge of surveying combined with his energy and thoroughness further commended him to this gentleman, who made him surveyor of his large estate. The appointment given, so exactly and well did George perform his work, that in two years' time he was given the office of public surveyor upon the recommendation of Lord Fairfax.

Promotion followed quickly. Before he was twenty, Washington was military inspector of the frontier with the rank of major. This post gave him a thorough knowledge of the backwoods and valuable training besides. He grew strong and vigorous, insured to hardships and dangers and through contact with all sorts of men, Indians among them, he gained a knowledge of human nature. Therefore when the Governor of Virginia needed a messenger to go to the frontier to settle

the border disputes among the French, Indians, and colonists, George Washington was ready. To the Ohio River he went and came back with clear and accurate reports and to the same region he returned, for it became the theater of the French and Indian War, which grew out of the border difficulties. From this war, strengthened by severe lessons, George Washington emerged as the most distinguished man in the colonies for honor, valor, and meritorious public services.

After six happy years of peace spent at Mount Vernon, Washington was again called into public life. When it was known that war was inevitable, that a head for the army must be chosen, one man stood out supreme in the public mind, above all personal and colonial differences—George Washington.

During the seven long hard years of war, with its varying defeat and victory, amid slow retreating, rapid advancing, and patient watching and waiting, the character of Washington shone out like a star. It gained him the love and trust of his sometimes half-clad and underfed army of patriots; it brought within the circle of his friendship all the men of character and ability who were prepared to serve their country unselfishly; it won the respect of Europe for the valor and integrity of the struggling colonies. Not in marvellous gifts of genius but in his great character, lay the greatness of George Washington. Therefore we may all, young and old, great and small, every year and all through the year, pay him that greatest tribute—the tribute of emulation.

A RĀJA YOGA PATRIOT

THE CHILDREN'S HOUR

Lomaland Photo. and Engraving Dept.

A GROUP OF RAJA YOGA GIRLS AT THE ACADEMY, POINT LOMA

The Little Girls of Lomaland

WHAT sort of big girls do you think these little girls will grow up into? They spend their days amid flowers, sunshine, and music, taking in what makes their hearts strong and their lives sweet and pure. They can do this because they are learning *to give*. When little folks learn this—Râja Yoga teaches them—their hearts are filled by the flowers and music and sunshine with more love, more strength for doing their work, and for helping others. Love is creeping out in their smiles and shining in their happy looks. Everyone who sees them feels it—and when they dance—ah! then, if you know how to look, you may see a million fairies skipping off with heart-light to the suffering people all over the world. G.

An Anecdote about George Washington

HOW very important are the days of childhood and youth, when so many things happen which can never be forgotten and so many ideas enter the mind which help to influence a person for his whole life. This was true of George Washington, as well as of many other great people; and a story is told about what happened when he was a boy—something which he never forgot and which helped him very much when he had

THERE'S NO DEARTH OF KINDNESS

THERE'S no dearth of kindness
In this world of ours;
Only in our blindness
We gather thorns for flowers!

Gerald Massey

grown up and become General Washington.

You will remember that Washington followed his mother's wishes when she sent him word not to enter the navy, though he dearly longed to go and learn to be a sailor. His mother knew what a disappointment it was to him, to give up all thought of going to sea, and she wished to show him that she appreciated the sacrifice he made when he yielded to her wishes and stayed at home.

In those days people in Virginia sent to England for many of the things they needed—just as Washington himself did later on—and Mrs. Washington sent across to the old country for a very nice knife for a present to her son. When she put it into his hands she said "Always obey your superiors." These words made a great impression upon the boy, for he loved and respected his mother. He often took out the knife and, showing it to his friends, would tell them of

his good mother and of her words, which he used to say he never would forget.

One day when General Washington was feeling very much discouraged, because it seemed as if he could not make the Government realize that something must be done at once to provide the soldiers with food and clothing, he actually began to think that he could lead the army no longer, if things were to go on in such a sad way for the soldiers. And he sat down and wrote a letter, giving up his command of the army.

The army without Washington! His generals could not imagine such a thing. Just then one of them thought of the penknife, and said to Washington: "You said you were always going to obey your superiors. You were commanded to lead the army. No one has given you the command to stop leading it."

These words seemed to rouse in Washington some thoughts he had for the moment forgotten. With his usual simplicity and unselfishness he quickly decided to keep at his post. The words of his mother, spoken to him in youth, were a kind of talisman, connected as they were with the gift he had received on the occasion of his obedience to the command not to go to sea—at that time the wish of his heart. They helped him to be true to his trust.

Theosophy and the Legends of the Pacific Islands

COMING generations ought to be very grateful to the collectors of folklore who are doing more than they know to support the historical teachings of Theosophy. They are preserving testimony in its favor which the world will regard as invaluable when it wakes up to the importance of Theosophy—"the most serious movement of the age"—though today the real import of the quaint traditions of the simpler races may only be known to a few. They are not regarded by orthodox science as records of actual facts, warped and distorted perhaps, but merely as the fancies of "primitive" myth-makers. But what is orthodox today need not, and in this case, will not, be orthodox tomorrow.

The scientific attitude is bound to change before long, for, as the legends are not pure inventions, thinkers will be compelled to open their eyes to this neglected source of valuable information. The resemblances of certain strange allegories found in many parts of the globe concerning the history of man and of the world, cannot be rationally explained by mere coincidence. The fact that most unexpected magical practices, such as the fire-walking ceremony, are carried on by widely scattered people, and that identical beliefs in the so-called supernatural co-exist among far-separated races, has caused some folklorists already to speculate as to the possibility of a carefully concealed knowledge to which the materialistic science of the West has not got the key.

A large number of strange legends of great interest to the student of Theosophy were fortunately collected in Hawaii before the wholesale conversion of the people to Christianity. Other Pacific islands have also yielded valuable information of a similar nature. The Hawaiian traditions are in the form of narratives and songs, and are of undoubted antiquity. Some missionaries suggested that their close resemblance to parts of the Old Testament proves a Hebrew source—that possibly the mythical "Lost Ten Tribes of Israel" wandered as far as Hawaii! But Theosophy simplifies the question without calling in any such wild hypothesis, for when we find that some of the legends are closer to the Secret Doctrine of Antiquity—the common basis from which the great world-religions sprang—than to the Old Testament story, the inference seems plain enough.

A devoted scholar, Judge Fornander, in his *Polynesian Race*, gives the Hawaiian account of the Creation by a trinity of gods, Kane, Ku, and Lono; or *Sunlight, Substance, and Sound*, who evolved themselves out of primordial darkness or chaos! This is extremely significant from the Theosophical standpoint, as all students of the "Stanzas of Dzyan" in H. P. Blavatsky's *The Secret Doctrine*, will immediately perceive. By an act of their will, these gods—who were regarded as fundamentally One—dissipated the chaos, created light, the *three* heavens, and the earth. An ancestral man was formed by the gods out of "red earth"—a purely Esoteric teaching—and woman sprang from his rib. While humanity was being made, the evil principle, the spirit Kanaloa, interfered, and said: "I will take your man and he shall die." And so it came to pass.

But this was not the first appearance of man on earth. This "man-and-woman," i. e., dual-sexed humanity, appeared upon the *reconstruction* of the world after it had been destroyed by fire on account of the sins of the first people. Here is an unmistakable reference to the destruction of the prehistoric continent of Lemuria in the Pacific Ocean, upon which a primitive race dwelt who were less completely evolved than the later physical Atlanteans.

In Hawaii there are several legends of the Flood and the escape of "Nuu" (!) and his family in a ship. They landed upon Mauna Kea, the highest mountain in Hawaii, after which Kane, the Deity, descended upon a rainbow in order to reprimand Nuu for some transgression. The Hawaiians had an elaborate tradition concerning the first beautiful continent upon which mankind lived, called Kalana-i-han-ola, or Kalana-with-the-life-giving-dew; and they had a vague recollection that the death of the first man was connected in some way with the tabooed fruits of the bread-fruit and apple tree. Other stories resembling those of Jonah and the Fish, Joshua stopping the sun, and Joseph's Dreams, have also come down to them from remote antiquity.

When the earliest Hawaiian converts to Christianity were taught the Bible stories, they are said to have been astonished at the parallelism of many of them with their own sacred traditions. How is it that we find such legends in the Pacific Islands, and not only there but scattered up and down the earth in most unlikely places, or preserved in the sacred books of dead or living religions? Can

we be so credulous as to believe that the large number of such coincidences are accidental? How unlikely it is that the world-wide story of the Virgin Birth of a Savior, in some instances on December 25th, and the many coincidences in the lives and deaths of Jesus, Krishna, Mithras, Buddha, Quetzalcoatl, and others, should have arisen spontaneously without any common philosophical origin. How shall we explain the universal tradition of the destruction of a former continent (Atlantis) by a Deluge, or the curious fact that the Biblical story of the Confusion of Tongues was believed by the Mexicans long before the arrival of the Spaniards—the Pyramid of Cholula replacing the Tower of Babel?

Thoughtful minds are refusing to believe that every tradition of the Jewish scriptures is a literal description of fact. Thousands of ministers probably believe, and a large number frankly admit, that at least the earlier stories in *Genesis* are to be classified with the folklore of other faiths, and should be studied in a broadly independent spirit. Unfortunately, in surrendering the old-fash-

Theologians Have ioned literal interpretation of **Lost the Keys to** the Bible, the more liberal **the Scriptures** churchmen are in danger of "throwing out the baby with the bath," for the poetical allegories of many chapters in these scriptures are really records of fact, condensed and transmuted into personal narratives in the customary Oriental way. But as the theologians deliberately destroyed what was left of the Mysteries of Antiquity in the early days when Christianity became the state religion of Rome, it is no wonder that the key has been lost to the West.

But Theosophy has returned again at this critical time bringing the only logical and effective solution of the problems which affect humanity. It brings that which can prevent the intellectual suicide of theological literalness or the hopelessness of Materialism. Theosophy is not a creed, which must be accepted under threats. In its intellectual aspect it is a lamp throwing light upon the difficult paths of research; in its practical aspect it is the builder of a new humanity.

Theosophy the The Rāja Yoga Theosophical **Light-Bringer** system of education designed by Katherine Tingley, the Leader of the Theosophical Movement, is training both old and young so that they can rise superior to the ordinary ills of life and know real happiness.

The study of folklore, in the light of Theosophy, proves that the ancient traditions are full of profound meaning and can be of real use to us today. It provides ample corroboration of the existence of lost and almost forgotten continents upon which we *ourselves* have lived and worked out many strange problems, the results of which are imbedded in the general consciousness of the race. It helps in the demonstration of the brotherhood or fundamental unity of mankind, and shows how incorrect it is to regard the civilization of the last few thousand years as containing the whole history of cultivated man.

Looking to the future, Theosophy promises that by unselfish effort, and borne along on the great tide of immortal life manifesting

Reincarnation is Nature's Simple Plan

through Nature's method of Reincarnation, we shall attain in coming ages to a heroic, nay, a godlike, life on earth, and when the lessons have been learned for which the spark of divinity within has been embodied, it will be time to pass on to higher spheres, having realized, in the words of William Q. Judge, that "sublimity in perfectness and actual realization of brotherhood on every plane of being are one and the same thing."

CHARLES J. RYAN

Is there a Personal Devil?

SOMEONE asked me if I believed in a personal devil, and I said, "Yes, certainly I did," for I had been brought into close range with him and knew him well.

So said an evangelist at a recent revival. One does not doubt that the speaker had shared the common experience of being brought into contact with the progeny of his evil thoughts and desires, an entity bearing so many of the human traits of its parent that it seemed like a personal being. But it is quite needless to suppose that there is only one such personal devil for all humanity. Indeed no one would be likely to hit upon such an improbable idea if he did not have in his mind the theological teachings about the Devil. Disregarding for the moment those teachings, and looking simply at the facts, one comes to the more reasonable conclusion that this tempter is special for each individual.

Whenever we frame in our imagination the picture of an evil thought, and accompany it with a corresponding desire, we thereby actually create an entity—not a human being, of course, but a living, soulless, irresponsible, semi-intelligent force. This abides in our atmosphere, and its one and only tendency is to express itself in action. It is like a seed floating in the air, ready to settle wherever it may find suitable soil. Perhaps it may not find the suitable conditions for a long time; and then, when we are off our guard, or in some way rendered susceptible, it may make its entry. As we have probably forgotten its original source, it will seem to us like a tempter whispering in our ear; and as it is made up of our own elements, it may seem quite like an actual being.

But this personal devil may not be the product of a single thought; it is more likely to be the accumulated growth of repeated indulgences. These indulgences may have been actual deeds or only mere thoughts; in either case it is the thought that is the main creative power. Thus we may create a veritable haunter, endowed with our own force and a part of our intelligence, ready to tempt us at any favorable opportunity.

Further it is possible that some of such creations may be the composite work of more than one mind; that the forces we create may assail other people, and theirs assail us. Thus there may be "devils" that claim more than one master, but still their "name is Legion, for they are many."

At this point it may be well to call to mind that we can also create good forces, such as might in a similar way be mistaken for "angels." Let us by all means create as many of these as possible, to minister to ourselves and to other people, and to neutralize the effects

of the legion of daimons of the other kind.

The theological Devil or Satan is another question. This has been proved by H. P. Blavatsky, who adduces to her support many other authorities, to be a misunderstood allegory. Satan is one of the Asiatic equivalents of Venus-Lucifer, the star which heralds the dawn. In symbology this stands for the Divinity incarnate in Man, for Luci-fer is the *Light-Bringer*. This ray from the Godhead sacrifices itself by "falling" from heaven to earth; that is, it undertakes incarnation for the purpose of raising the lower elements of human nature to the status of the perfected Man. But theology has transformed this Satan into a demon of darkness, thus destroying the meaning of the sacred allegory. And, having thus deprived Man of his Higher Self, it has provided for his salvation by devising the doctrine of vicarious atonement and prescribing the interposition of ecclesiastical machinery.

Hence the personal devil is a mixture of two distinct things. First there is the common fact of experience—that we are actually dogged by the phantoms of our own evil thoughts and past acts; second there is this transformed sacred allegory. But the idea that there is only one personal Devil is as absurd as the idea that there is only "one personal God." The eternal Source of all things is not personal, but something far more than personal, for personality is a limitation. And of intelligent forces, both good and evil, there are countless numbers, of all grades, in the universe. STUDENT

Increase of Population in Cuba

IN 1899, at the close of the war, the population was 1,572,797. On September 30, 1907, it was 2,048,980. This increase is at the rate of 39 per cent per decade. It has not been brought about by immigration, for the foreign element increased only 0.2 per cent; but it is due almost entirely to the excess of births over deaths since the war. The rural population has gained much more rapidly than the urban. About 9 per cent of the population were born in Spain, and less than 3 per cent in the United States. Children under five years of age formed nearly 17 per cent of the whole population in September, 1907, nearly double the proportion in the United States. The children of school age were, however, 11,500 less than in 1899. The war and the accompanying reconcentration caused the death of vast numbers of young children, most of whom were under the school age. The survivors are now eight years older and constitute a large proportion of the school age class, while the numerous children born since the war have hardly reached the school age.

Of the whole population 37.7 per cent were wage-earners, comparing with 39 per cent in the United States. Of boys between ten and fourteen, 27.8 per cent were wage-earners. Of the whole wage-earning population nearly one half are engaged in farming, fishing and mining. Manufacturing and the mechanical arts, trade and transportation, domestic and personal service, about one-sixth each; and the professions, about one and a half per cent.

The foregoing facts are extracted from a paper read before the American Association of Geographers in January, published in *The National Geographic Magazine*. J.

Some Views on XXth Century Problems

Drink and Genius

A WIDELY known American lady-novelist has just published a story in which the hero is a poet — when semi-intoxicated; otherwise a mere versifier. She constructed him by combining two actual cases, poets, one just dead — a degenerate who could hardly button his coat except when stimulated by alcohol, but could then in addition write real though decadent poetry; the other still living, a great poet once.

I think it was something like twenty-five years ago — he is an old man now — when a friend of his took him in hand and cured him of his dissipated habits. Result: no more poetry.

Before that, his poetry "was the marvel of the critics and bears the mark of the most genuine exalted inspiration of genius."

The name of neither is to the point. The novelist passes on to the discussion of the relation in such cases of genius to alcohol. She seems to think that genius is some spot in the brain, a spot which in the case of these poets responded only to alcohol — evidently a quite material spot, and, she seems also to think, necessarily abnormal and even diseased. "With the other workers in the realm of imagination this diseased spot may proclaim some other peculiarity" — than that of requiring alcohol as a stimulant.

Genius cannot be explained, of course, but some of the laws at least by which some of its abnormal characteristics are set free may come within our comprehension, . . .

If genius is divine or supernormal-human, how comes it to be (apparently) *stimulated* by such a substance as alcohol? How even made free?

The difficulty is insoluble except in the light of reincarnation.

The real genius knows that in his greater moments he, as a thinking personality, is not creating but giving form of some sort to a breath, a light, a current, coming down upon his mind from some higher part of his nature. He knows that if his body is in certain ways out of order, his mind will be so dulled that it cannot find the exact word or thought or combination of color or sound which is needful to *express* the inspiration which may nevertheless be present. If it be still more dulled it may not even be able to feel the inspiration at all — which *may* nevertheless be present. He cannot say that it is not.

Suppose that under the influence of alcohol he finds that he can now compose. How is this? For a short time, during the first stage of the subtle work of alcohol, it behaves from one point of view as a stimulant, throwing the brain-cells into a state somewhat resembling that of relative health. The mind is therefore freer in its motions and can respond for that time to something from beyond.

But this is no stimulation of genius. It is a mere temporary clearing away of gross obstacle to its expression. Very temporary; done at great cost to brain and body; done with constantly more difficulty, and leading to final wreck. The hireling presents his bill.

Why cannot all men express genius during temporary half-intoxication, "stimulation"? All men have the Light within, above, part of them, the soul, the Genius, Daimon.

In other lives the man of genius cultivated the relationship, the communication; made his mind by great effort susceptible to the inspiration of that part of self which is beyond mind, raised it out of entire subjection to the moods and conditions of the body. It is possible to go on with this work from life to life, making the mind finer and finer, making it at last the perfect expressor of the soul; that work ends in man re-becoming a god.

But it is possible to let it go, to cease efforts, to slip sideways into paths of vice and sensuality which wreck body and mind. For more than one life after, the mind may retain half latent some of the power once gained. It is in subjection to the body, but if by any means the body can be tranquilized and the muddy brain-cells cleared again for a little while, that latent power will manifest itself and there may be poetry. There may be real poetry, but it will show the stains; it will have more or less of decadence, of the erotic; and the life of the poet will show what is happening to him. He is going downhill and if he is not pulled up short may reach the last cosmic ditch.

Let such a man, if he finds that he cannot compose without alcohol or morphine, live without composing. Let him train his will. Let him lead such a life as will entitle him, at his next birth, to a body that will not hamper and smirch his mind. And let him seek the soul, the Genius, once more. For if he cannot respond to those of its waves which under happier circumstances would give him genius, he need never remain unresponsive to those which will give him joy, peace, an ever clearing comprehension of life, an ever greater love for right action and for humanity. And he can never know that at some unexpected moment the whole power of his past will not suddenly descend upon him. C.

Will as a Catalyst

THERE are some physiologists who are also philosophers and believe in the soul.

But they are compelled as a rule to keep the two sides of their thought entirely apart, and when lecturing in their physiological class rooms you might never guess that they were not complete mechanicalists.

You would hear them explain that intake and output of force were identical in quantity. From sunlight and food, as we go through life, we get a supply of force. Most of this we expend in keeping up our heat and in doing work. Any that remains after our death is gradually liberated in the complete destruction of the body during its decay. From the moment the force enters us it goes through changes, one after another, corresponding with chemical changes in the cells which take it up, use it, and free it again; each change was necessitated by the one that came before and necessitates the one that comes after. There is an unbroken chain.

This is the physical side of life; the lecturer knows, of course, that consciousness *attends* upon the chain all along, as link passes into link; but he does not think it *active*.

There is obviously no place for will, and the lecturer, as physiologist, cannot see where it would come in. Will cannot be thought of as an element in a chemical equation, and life is a sequence of chemical equations adventitiously painted with consciousness. Will, if anything, is from within; if it can affect chemical reactions, guide forces of phenomenal nature, it must do so by adding to them or subtracting from them, neutralizing or reinforcing. To admit that would be an affront to the doctrine of the persistence of force. It is therefore not a force, which is to say that it does not exist.

All this the lecturer would have to put aside if he were to speak as philosopher. As such, he would have to speak of will as playing *the* active rôle in cosmic and human life.

Is there any necessity for the philosophical or spiritual physiologist to keep his mind in two compartments? Can we not conceive, at any rate by analogy, how will can be an active factor in the flow of forces and yet be not one of them, looking at the matter from the purely scientific side?

There are certain substances known to chemists as ferments or catalysts which *initiate* or *guide* chemical reactions among other substances among which they may be placed, which only need to be present in the minutest quantity, and which themselves undergo no change or diminution of quantity or activity however long they may be at work. Many metals are in the group; one two-hundredth of a grain of platinum will cause ten quarts of hydrogen and oxygen to unite. Invertase, obtained from yeast, will change 200,000 times its weight of ordinary sugar into invert sugar. Pepsin is another; the body is full of them; indeed it is suspected that all its activities are carried on by means of them. How they act no one knows, further than that they guide phenomena — changes of force, the passage of the links — which would otherwise occur differently, or initiate phenomena which would otherwise not occur at all.

Have we not here a possible analogy to the work of will? Have we not, in catalysts or ferments, an example of something which *guides* forces without adding to or taking from their quantity and without losing itself in the process? If we see a horse coming we can either run away, or, to save the child, run to meet it, the two acts involving perhaps exactly the same expenditure of force but throwing it out in two different acts. Will was used; but we do not need to believe that will was part of the physical force used or that it was altered in quantity; it behaved like a ferment, guiding expenditure.

And so, in making some statement that includes will and the soul, we could perhaps say that will is the soul in action, realizing outwardly its inward nature; or that will is the power set going by the soul for the realization of its nature.

Art Relics of Pompeii

SOME notes on Pompeii, with illustrations, appeared in last week's issue of the CENTURY PATH. The art treasures discovered there, one authority says, excite the utmost admiration in their profusion, the elegance of their design, and the exquisite finish of their workmanship. And they are only the casual gleanings from a second-rate provincial town!

The illustration shows amphorae such as were used by both Greeks and Romans for preserving wine, oil, fruits, etc.; tall slender vessels of earthenware, and sometimes of stone or glass, with two handles at the neck and tapering to a point at the bottom.

The number of utensils found in Pompeii is almost endless, including numerous surgical instruments, some of them very ingenious and elaborate, *but all of bronze* — and this when the Romans used tools of an iron that has not rusted and that must have been as strong as steel. Their razors, too, were of bronze, and the Roman aristocrats were clean shaven and, in later days at least, most remarkably particular and delicate about the care of their skin. Conclusion — they knew how to put a razor edge on this bronze.

If a modern second-rate provincial town were buried for centuries, how would the casual gleanings from its ruins compare with those of this ancient town? The answer to this question determines the result of the following rule-of-three sum: as those relics are to the relics of Pompeii, so is the modern town to the ancient town as it was. STUDENT

Rustless Iron of the Romans

REFERRING to a dogmatic statement made by someone, that Roman ironwork could not exist today on account of having rusted away, a correspondent to the *English Mechanic* says that in the Antiquarian Museum in Edinburgh there is a collection of articles found during the last two years in the excavations at the Roman Camp at Newstead near Melrose. These include an iron helmet, beautiful specimens of work in sheet metal, the faces being wonderfully well portrayed; the iron socket of the pole of a chariot; two chariot wheels, with the felloes of ash — a single piece bent round with one joint, the joint clamped on each side with iron; the spokes of elm, the iron tires in position, and the wooden naves bound at each end with broad iron rings. There is a collection of gardener's tools, in which are two scythe-blades, and a rake-head consisting of eight or nine iron spikes driven through a wooden cross-piece. A large number of hooks, rings, a chain or two, eyed hooks

Lomaland Photo. and Engraving Dept.

COLLECTION OF AMPHORAE, POMPEII

(the large eyes being welded); several bridles and bits, the bits being formed of square iron twisted into spirals when hot. Among the carpenter's tools are adzes, chisels, and axes in good preservation; a gouge, a boring-bit. In the smith's tools are several hammers, sets, flatters, etc. A cold chisel is interesting, as the head is spread and the sides somewhat split by much heavy hammering; yet the shank is only a half-inch in thickness, and how could it have stood up to the hammering "unless it was of steel"? The writer concludes that it is evident the Romans were more advanced in civilization and the arts than we have been accustomed to think.

And their energy and power of work appear to have been enormous. In the first Punic War they built a fleet of one hundred quinqueremes and twenty triremes in sixty days from the time the trees were felled, using a wrecked Carthaginian ship as a model. The above account of antiquities seems to show that they knew how to make their iron — or was it steel? — rustless. There are also points in connexion with cements and plasters that we should be glad to know. Certainly this century seems destined to witness the explosion of many an old insular notion regarding our predecessors.

But our over-estimation of ourselves, being a sign of vanity, must pale in the light of knowledge and may make room for true pride, which does not nourish itself on the depreciation of others but is as generous as it is dignified. STUDENT

An American Pompeii

THIS is the name given to the Casa Grande ruins near Florence, Arizona, by the annual report of the Smithsonian Institution. The work, which is still proceeding, has proved the ruins to be very much more extensive than was expected. A large number of structures has been discovered, but the largest excavated during the past year was one 200 feet long with eleven rooms and a plaza. In the central room is a seat called by the Pima Indians "the seat of Montezuma." Shall we have an American Renaissance, attended by a discovery of past classical ages peculiar to this continent? If so, the history of the world will be changed for us, and the traditions of Asian-European culture may be modified by something entirely new.

For America too has a mighty past, as we know from the indestructible buildings that have come down to us from times preceding those of the earliest races of whom we know anything, and from the existence on some of these buildings of a symbol language, which, though for the most part yet undeciphered, has revealed an extensive knowledge of the greater astronomical and chronological cycles, similar to that of the Egyptians. But there is a huge gap between them and us, which may yet be bridged over; and then we shall have something more worthy of study than the bone-yards and waste-piles in which so many archaeologists are now mining. T.

The Walls of Jericho

A German society has been excavating a group of mounds near the village of Ericha, by the Dead Sea, the supposed site of the ancient Jericho. After a week's digging, the exterior wall was encountered eight feet below the surface. *The excavators were astonished at the technical excellence of the construction.* Somehow the facts seem to be always running afloat at the theories of excavators. The wall consisted of three parts. The natural rock foundation is overlaid with a filling of loam and fine gravel, upon which is a sloping rubble wall, heavily bulging externally, twenty feet high and from six to eight-and-a-half wide. This wall has enormous blocks at its base and every interstice is carefully filled in. Upon this foundation is the wall proper, of clay bricks, and the whole must have been an imposing structure visible for many miles.

Some experts are in doubt whether the walls are those of Jericho; and the remark is made that there is need for scepticism about archaeological finds, as sites are often "salted" by interested parties! STUDENT

The Trend of Twentieth Century Science

Inorganic Bacteria

A NUMBER of phenomena lately reported suggest the existence of inorganic bacteria, though the microscope has so far revealed nothing. That metals are in their way living has been known for some time. They can be poisoned, chloroformed, tired out, and so over-tired that they do not fully recover.

It now appears that they can be the subject of infectious disease. *Knowledge and Scientific News* reports this phenomenon in the case of a piece of tin, the changes in which were described by Dr. Von Hasslinger. It had been kept about two years, by the end of which time it had completely changed its appearance, the surface being granular and dull. Its texture was softer, and instead of melting as previously at 231 degrees centigrade, it now melted at 205. But this melting appeared to kill the disease, for on cooling it had recovered its original appearance and melting point.

The infectivity of the disease was shown by the fact that when small portions of the plate were left in contact with healthy pieces, these soon became inoculated with spots of the same condition which spread at the rate of several millimeters a day.

If metals can retrograde under the influence of metallic bacterial monads, it seems possible that they may progress under similar influence. The changes of and beyond uranium show the possibility of slow general permutation everywhere among them, and this may perhaps be always mediated by forms of life appropriate to such grades of matter.

Man's Antiquity

IF as Theosophy claims, man is so very ancient, why do we not find his bones? If he was on earth with the great reptiles, why do human bones only begin to appear so much later? Why, even when they do begin to appear, are they so much fewer than those of the animals? Compared with the animal life, the human palaeolithic period was but of yesterday; compared with that, the beginning of the stone age was yesterday. Yet all along, we are told, there was man.

Sir Ray Lankester has recently given a part of the answer to the difficulty. The absence of bone-remains arises

partly from the fact that human bones are not so thick and strong as those of the large animals, and more easily soften, break up, and are lost. It is also due partly to the fact that the men were not nearly so numerous as the wild animals; but it is chiefly due to the fact that these people usually, but not always, buried their dead in the open, and whilst the bones of animals which had been eaten were left about in heaps on the floor of the caves, and became cemented together by the petrifying deposit caused by water dripping from the walls of these limestone caverns or occasionally actually flooding the caverns, the bodies of the men themselves were removed when they died by their friends and family, and buried in the open ground, where they have gradually dissolved and broken up.

But that difference in texture which Sir Ray Lankester notes, and which may formerly

have been much more marked than now, does not cover Theosophy's claim that prehistoric man was *civilized*, as civilized as, and sometimes more than, man today. Yet as we go back through our own iron age, through the bronze age, to and through the stone age, we find a nearer and nearer approach to savagery, and at last savagery itself. How and where the civilizations?

First then: in Asia, in Central and South America, ruins have been unearthed which Theosophy asserts on various evidences to antedate by far the European lithic periods, ruins that abundantly demonstrate the civilization of their builders and on which current history is absolutely silent.

And secondly: continents have gone up and down throughout geological time. What is now continent was once sea-floor; the sea-floor was and will be continent. Where is now the Atlantic was once Atlantis, and on this immense continent was that civilization or were those civilizations of which Europe and Africa, as they appeared, harbored the barbaric fringes. The fringes remained when the great continent sank in a series of catastrophes recorded in many legends; and they ultimately became the palaeolithic people whose remains we barely find persisting in the caves of Europe. Theosophic history has lightly sketched all this. There will be much more when science begins to find the sketch reasonable and explanatory of many present difficulties.

STUDENT

The Catarrhal Safety-Valve

SUMMARIZED in *The Medical Record* is some bacterial work recently done by an English microscopist, Dr. R. W. Allen, the bacteria brought by him to book being those concerned in catching an ordinary cold. It appears that there are four sorts of them, usually working all together or in twos and threes, any one of the four being, however, capable of doing full execution alone.

Dr. Allen discusses various medicinal remedies, settling down upon oil of cinnamon or oil of eucalyptus as the best. But he finally comes home to vaccine therapy, advising injections of cultures of one of these germs if you can find out which is answerable for your misery, or of all of them if you cannot. This is during the continuance of the cold; but after it is over you are to secure yourself against further invasion by an injection every four to six months.

That might possibly be successful; there might be no further colds. But what is a cold? What preliminaries lead to it? We know now that the preliminaries consist of a systemic storage of effete and under-oxidized matter, small piles of combustibles here and there in the blood and tissues. They are present mainly because of overeating and under-exercise, aided by other faulty habits and conditions. When accumulation has reached a certain point, the small piles invite the presence and multiplication of disease germs, those connected with colds being usually the nearest at hand. A conflagration follows,

pains in the muscles, acute catarrh, a little fever. In a few days it is over and the danger-piles have removed. The cold has been more beneficial than otherwise.

But suppose the prophylactic injections have been sedulously submitted to. No colds occur. The rubbish piles go on growing, unsuspected by the victim. They attain a considerable height and finally the pneumonia coccus gets wind of their existence. He has a fine mass of food, unlimited chance of multiplication, and he makes full use of it. May not the immunity from colds now easily cost the man his life?

In this country each average person eats half his weight of sugar in a year. If he will leave that out of his diet the chief ingredient of his rubbish piles will be missing. Perhaps in the same time he drops half his weight in nickels into the hands of car conductors. If he will stop doing that, most of the other ingredients will be missing. The germs will find him swept if not necessarily garnished, and resume their old stand outside the ice-cream parlors waiting for the people to come out.

Atmospheric Layers

NO one has yet any theory to account for the "isothermal layer" in the upper air.

Its existence is now undoubted, having been perhaps finally settled by a series of twelve balloons sent up experimentally last year by the British Meteorological Office. Up to a certain height, as those who have ascended mountains know, the air lowers in temperature. But at a height of nine or ten miles this lowering ceases and the temperature then rises considerably. The rise is not due to solar radiation, for it exists just as well by night as by day. The radial extent of the layer is not yet known, nor whether any special conditions obtain just beyond it. Immediately this side of it is a layer in which the wind velocity falls, and at a height of about twenty miles there is a layer in which the wind is moving continuously with an enormous velocity. The atmosphere is in fact like everything else: the more we know of it the more does uniformity disappear in complexity of structure. At present the electrons are all uniform, and the earth's nucleus is a uniform steel ball. Doubtless if we had better eyes no two electrons would be exactly alike or would have exactly similar functions; and the earth's nucleus would be as complex in structure as we are now beginning to know that the interior of an amoeba or a blood cell is.

STUDENT

Our Cities' Disease Layers

SOME recent bacteriological studies in cities might give us a hint as to how *not* to build them. Specimens of air were captured at successive heights, corresponding with the stories of the houses. In streets of some depth, there is a sort of sediment of bacteria, pretty thick and with a liberal proportion of disease-producing species. From this level upward, there were fewer and fewer bacteria according to the height. STUDENT

"RUFUS STONE," NEW FOREST, ENGLAND

The Rufus Stone

THE picture shows, not the stone, but the triangular iron pillar in which it is encased as a necessary precaution against the vandal hands of tourists who were transferring it piecemeal to sundry spots on the earth which they considered more sacred. Here William Rufus is said to have been slain by an arrow in 1100—whether by accident or design is disputed. The inscription gives the familiar story that the arrow was shot by Sir Walter Tyrrell at a stag, and glanced from a tree. The New Forest is by no means all trees, but includes much beautiful heath-land. It is 76,000 acres, and contains herds of deer. It is mostly Crown land, and to the Royal father of Rufus England owes the preservation of this beautiful spot in an uninhabited condition for over eight centuries.

T.

Queer Insects of Southern California

WHEN digging in the soil the gardeners frequently uncover a large, uncouth, incredible kind of insect called the Jerusalem cricket. The abdomen is striped with black and white transversely and is enormously corpulent. He has a babyish look in his face, and one pair of his six legs a little resemble those of a common cricket, but are quite useless for jumping purposes. They are supposed to appear above ground only after dark, which is just as well, as they look so unfinished and incomplete as to be quite unrepresentable to the public gaze. They are said to feed on decaying vegetable matter.

On summer days is often seen an active busy little insect racing over the paths, and at first sight one might almost suppose him to be a little tuft of scarlet plush blown by the wind. It is the wingless wasp, or rather one of the wingless wasps, for there are many species. Some are larger than honey bees, some are much smaller, some have gray hair and some have white hair; but all display the same restless activity. The male enjoys the power of flight and sometimes may be seen engaged in condescending conversation, by means of his antennae, with one of his crawling, earth-bound sisters. The wingless wasp has a very bad character with some students by reason of a very effective sting; but if handled with reasonable courtesy they will run all over the hand and never offer the least offense.

Minerals Produced in the United States

A GEOLOGICAL Survey table classifies the mineral products of the United States as follows:

METALLIC: Pig iron, Silver, Gold, Copper, Lead, Zinc, Quicksilver, Aluminum, Nickel, Tin, Platinum.

NON-METALLIC: Fuels: Bituminous Coal, Pennsylvania Anthracite, Natural Gas, Petroleum.

Structural Materials: Clay Products, Cement, Lime, Sand-Lime Brick, Slate, Stone.

Abrasive Materials: Corundum and Emery, Abrasive Quartz and Feldspar, Garnet for abrasive purposes, Grindstones, Infusorial Earth and Tripoli, Millstones, Oilstones etc.

Chemical Materials: Arsenious Oxide, Borax, Bromine, Fluor Spar, Gypsum, Lithium Minerals, Marls, Phosphate Rock, Pyrite, Sulphur, Salt.

Pigments: Barytes (crude), Cobalt Oxide, Mineral Paints, Zinc White.

Miscellaneous: Asbestos, Asphalt, Bauxite, Chromic Iron Ore, Feldspar, Fibrous Talc, Fuller's Earth, Glass Sand, Graphite, Magnesite, Manganese Ores, Manganiferous Iron Ores, Mica, Mineral Waters, Monazite and Zircon, Precious Stones, Pumice Stone, Quartz, Rutile, Sand (molding, building, etc.) and gravel, Talc and Soapstone, Tungsten, Uranium and Vanadium.

What Makes the Heart Beat?—Salt!

A QUESTION asked in a scientific contemporary as to what makes the heart beat, is answered in a manner strikingly illustrative of the weird faith of modern science that puts ancient "superstition" in the shade. It is not God that makes the heart beat; it is not the Archæus or the vital principle; not even protoplasm this time; but simply sodium chloride, NaCl, common table salt! This, it seems, had been suspected before; but now it is confirmed by the behavior of a certain jelly-fish, caught off the coast of Florida and examined by a biologist. These creatures pulsate in sea-water—but only under the condition that they are not deprived of certain organs in their outer rim.

These organs are a number of minute specks to which has been given the name "sense-bundles." When they have been cut off, the jelly-fish no longer answers to the stimulus of the sea-water. The explanation is that the sea-water contains besides the stimulating NaCl, other salts which have a contrary influence and so neutralize the NaCl. But the sense-bundles contain calcium oxalate, which reacts chemically upon the sea-water in such a way as to yield an excess of common salt, whereby the creature is made to pulsate. The writer on this investigation goes on to speculate whether an excess of common salt may not be the "cause" of the beating of all hearts, including the human heart.

It seems as if we were getting back to the old theory of the alchemists, with their "Mercury, Sulphur, and Salt," in which category salt represented the spirit of animal life. True, they reached their results deductively instead of inductively; but either method of reasoning will yield correct results in proportion as it is rightly founded and rightly reasoned; and a true symbol should work out correctly on all planes. It would be strange indeed if science should come to the conclusion that salt is after all the main ingredient in producing the phenomena of animal vitality; and perhaps similar discoveries might be made with regard to sulphur and mercury. But, we throw, no amount of the sodic chloride would suffice to make the heart, of marine radiate or terrestrial biped, beat without the presence of its invisible host.

Path

THE MESSAGE OF THE MOUNTAINS

O! BEHOLD the mighty mountains
 With heads uplifted high
 Like giants bold, in times of old,
 Their faces toward the sky —
 "Look up," they say, in silence grand,
 "Fear not the shadows dim;
 Great Souls are not cast down with gloom,
 There is a strength *within*
 That comes to all who dare to stand
 Upright, and brave, and true;
 Believing that a power for good
 Is working through and through
 This undeveloped life of ours."
 And, surely, day by day
 We, like the mighty mountain peaks,
 Shall find the wondrous way
 To lift our heads and hearts on high;
 And use the mighty power
 Implanted in the human soul
 For some great good each hour.

Octavia Goldsworthy

The Pursuit of Knowledge

THE teachings of the philosophers and sages of all time are founded upon the essential difference between man and the rest of created beings, in that he alone is endowed with powers of thought, by the right use of which he may attain to knowledge and true wisdom.

A consideration of this makes it evident that thought and wisdom are not synonymous terms. Thought seems to be a process of trial and endeavor by which true knowledge may come to be realized. Wrong thoughts lead to wrong conclusions. The experience brings painful results, which are mercifully interposed by the Law of Being as a check upon their continuance. Right thoughts contain within themselves their own confirmatory essence.

Thus, there is within man himself a potentiality of true knowledge. In these days we are scarcely aware of it, or have lost sight of it. But this mark of divinity is man's birthright. It is a part of the man himself. And it can be discovered by him who will recognize and hold it within his consciousness as the guiding star of his life. It is his savior and comforter in the difficult and thorny road which leads to the realized knowledge of eternal peace and wisdom.

If this be so, and so it is, then what is thought? It cannot be wisdom, for this is a thing apart. You may have thoughts of wisdom and unwisdom. The latter are dark, turbulent, cloudy, inharmonious, decadent. The former are bright, peaceful, harmonious. The latter come from the lower, the former from the higher man. And the recognition of the dual nature of man and the resulting influence upon his thoughts is one step on the road to wisdom. And surely a considerable step.

It would appear that a thought is a shell of

outward seeming which contains an essence within itself, and the nature of its existence is due to the power of the essence within it. There is a part of man which enables him to judge of this. The task before us is so to act from our higher nature that our thoughts shall be directed along lines harmonious therewith.

This higher part of man's nature knows everything without ratiocinative thinking. It may be very deeply hidden but it is there. It is wisdom itself. Its existence accounts for the persistently innate ideas (which we all have) of our own Immortality, and of the guidance of Law through all planes of being. Any man who has strength enough entirely to *stop thinking* for a moment, and to look calmly at this idea, will *know* it to be true. If he does not do so, it will be because he has not stopped thinking.

The currents of thought run through the minds of men so persistently that it is very difficult to stop them even for a moment. Most men's characters are fed, unknown to themselves, by the crumbs of the essence, bad or good, which lies behind their thoughts. It is not to be expected that in an instant a man can stop all this and, recognizing unveiled truth, step right into it. But at least we can begin to control our thoughts, and neutralize low ideals by high ones. The very fact that we know how to do this is the proof of the presence of the silent discriminating divinity which is beyond thought.

We have been accustomed to believe that thought is a function of the brain; but this is more than doubtful. No doubt the brain is a physical register of thoughts of one kind; but it is questionable whether it is capable of producing any of those lofty aspirations of thought which lead to real knowledge. Its function is that of the personal, lower, or animal mind. A Teacher has said, "the lower mind sees nothing beyond its own desires, its own personal interests and gratifications." No doubt the brain is the register of what modern education is pleased to call "facts."

Let us carry the idea one step further and suppose that a man named John Smith thinks that he is John Smith and that is all there is in it. His brain is apt to tell him so, because it has no evidence to the contrary. But the fact is far otherwise. The truth is that he is a mystery to himself, who is masquerading through one brief day of eternity in the character of John Smith, so that the real man, the mystery, may be taught and enlightened by that particular experience. It is also true, little as he may think it, that this experience was chosen by the mysterious being within, and that no blame attaches to anyone but himself, for all that has happened or ever will happen to him.

Real knowledge can never be arrived at through the brain. Neither can it come by contentious argumentation and during the encounter of the opposing idea-forms. The real knowledge is revealed in the silence when the fight is over. This is true whether it applies to the arguments of contending words in debate, or the arguments of the brain-mind within a man's own temple of consciousness. The real knowledge is wordless and needs no argument. It is the voice of that within which knows.

No man can arrive at the truth vicariously. He has to work for it himself, and within

himself. In doing this it is well for him if he pursues the right methods and looks in the right direction. If he will do this wholeheartedly, he will soon acquire confidence that he is on the right track. The opinions of others are utterly useless to the real seeker, unless they obtain that confirmation which his own mirror of truth will surely give him.

Many years ago a well known preacher had a circle of friends and admirers. He was much looked up to as a man of knowledge, though he held the opinions of a narrow and soulless creed. As a man of enormous intellect he carried much weight. But those who were looking further afield came to know him as "the man who kept his opinions on his bookshelves." If anyone asked him what he thought about a point of doctrine, he invariably took a book from his well furnished library and read to his inquirer the opinions of others. They seldom contained any real food for an earnest seeker, hungry after truth.

Thus, from one aspect we may look upon thought as a shell which contains an essence within itself. It is an outer form in which knowledge is clothed. It is the idea which holds the ideal within it. It registers nothing but the mask, the veil, or covering, of truth.

A man's character depends upon that formless essence, consciousness, which lies behind his thoughts, and as he lives up to the highest within him his own divinity will supply the discrimination to aid him in choosing and directing them rightly.

Whilst we intuitively attach no real value to any other man's opinions, until we have proved them by the touchstone of our own consciousness, we can never forget that there are men who have passed on this road before us. Each man must gain for himself the power to recognize these wise ones. And with boundless love and gratitude he will know that to them he owes his second birth, and that they are the true guardians of the world's priceless wisdom. He will find that they point out the road which even then he must test for himself in every step.

These masters of wisdom say that in the silence is the only true knowledge, the silence of word and brain. As said by H. P. Blavatsky in the *Voice of the Silence* (from *The Book of the Golden Precepts*):

Have mastery o'er thy thoughts O striver for perfection.

Thou hast to feel thyself ALL THOUGHT and yet exile all thoughts from out thy Soul.

And in the *Bhagavad Gītā*, Krishna in the following marvelous description thus instructs Arjuna as to true Wisdom:

I will now tell thee what is the object of wisdom, from knowing which a man enjoys immortality; it is that which has no beginning, even the supreme Brahma, and of which it cannot be said that it is either Being or Non-Being. It has hands and feet in all directions; eyes, heads, mouths, and ears in every direction; it is immanent in the world, possessing the vast whole. Itself without organs, it is reflected by all the senses and faculties; unattached, yet supporting all; without qualities, yet the witness of them all. It is within and without all creatures animate and inanimate; it is inconceivable because of its subtlety, and although near it is afar off. Although undivided it appeareth as divided among creatures, and while it sustains existing things, it is also to be known as their destroyer and creator. It is the light of all lights, and is declared to be beyond all darkness; and it is wisdom itself, the object of wisdom, and that which is to be attained by wisdom; in the hearts of all it ever presideth.

STUDENT

HOMER

HOMER, thy song men liken to the sea,
 With every note of music in his tone,
 With tides that wash the dim dominion
 Of Hades, and light waves that laugh in glee
 Around the isles enchanted; nay, to me
 Thy verse seems as the River of source unknown
 That glasses Egypt's temples overthrown,
 In this sky-nurtured stream, eternally,
 No wiser we than men of heretofore
 To find thy mystic fountains guarded fast;
 Enough—thy flood makes green our human shore
 As Nilus, Egypt, rolling down his vast,
 His fertile waters, murmuring evermore
 Of gods dethroned, and empires of the Past.

Question Ought we not to know and understand life, and be able to recognize where and why failures occur? And in order to do this, should we not study the people around us, their faults as well as their virtues? Why then should it be called gossip, to speak of the failings of others?

Answer We ought to know and understand life, but such understanding never yet came from chatter of that kind. Our eyes ought to be very keen and alert, upon our own business; all our actions should be set through a strainer, filtered, as it were; and put under spiritual microscopic scrutiny. This is the first duty; because man has a grand faculty of seeing askew. What seems a mountain in another, often appears to be no more than a molehill in ourselves, for there is a strange refraction in the atmosphere through which the brainmind views the world.

That atmosphere must be cleaned of its treachery, which is to be done by work; it would be well, therefore to set about working at something when the desire for gossip comes on you. By work you shall learn; your own effort and the resistance of your material coming together, make a sort of friction which wears down the bitterness and rawness of your nature. So and so, poor fool, engaged upon such and such a work, does not come up to your ideal in the performance. His best effort is clouded in stupidity; he is evidently at least half blind? Let be; if there is any effort there, the man is yet pushing forward the lumbering wagon of the world. What of yourself? Are you pushing, too, in your own sphere? Do you exert any better muscles than those of the tongue and jaw?

But you two are side by side, and it is evident that half your effort is wasted because of this man's ineffective procedure. He sprawls and wanders; his ungoverned limbs are constantly in the way of his colleagues. Now and again he has a habit of pulling in an opposite direction; too much to the right or to the left, or entirely backwards. Does that interest you; do you find it a profitable topic? The object after all, is to move the thing forward; one's mind ought to be concentrated on that. One can become a veritable dynamo of force; charged and perpetually accomplishing; but this cannot be while there is any leakage through unnecessary speech.

A seal is set upon thought as well through speech as through action; the word, as well as the deed, opens a certain gateway into the

material world. You may vent a thing in speech, which was before unknown, until it becomes recognized and a part, as you may say, of practical politics. All sounds have some wonderful effect upon the consciousness of man; and sometimes we perceive these, but more often they go to make up that grand concatenation of infinitesimal currents which molds and directs the life of the world.

So when you speak of your fellow's failings, you do but confirm them, and him in them. "Give a dog a bad name"—and he will live up to it, in all probability. Some men are deliberate hypocrites, and have one life for the world to see, and one for their own delight and destruction. But with the run of mankind, there is no clear decision of this sort; we live a life in common, and are, to ever so great an extent, what others make us. We ought not to be: there is a fountain of life and mastery within ourselves, which, did we but clear the way for it, would flow out spontaneously and tinge and uplift the living of the whole world. But now volition only leaks through us; and this perpetual leakage through all mankind forms the great drift and current of the world, so very hard to stem.

We live a life in common, and the daily food of our mentality is mainly alien thought. You can easily wreck a man's life by setting abroad an evil report of him; get enough men to think evil of him, and it is a good chance that from being innocent he will become evil. If we had the sense and power to do it, we would realize his capabilities for good, even though he failed to live up to them; thus our thinking would in time be an incentive to him to come up to the standard we were setting. To think well of a man is to challenge him. *I declare you to be a soul: we as good as say, now, will you dare to be less?* It is as if a life-line were thrown to the hidden divine in him, this high belief by another. If the belief were strong enough and universal enough, the soul so believed in could hardly fail to be evoked; unless there were sentimentalism on the one hand and hypocrisy on the other. You know your brother's failings? Fix your eyes on his virtues then, for always that will grow on which thought is concentrated. Know the failings, yes, and guard against them; but this without letting them be among the contents of your mind.

The truth is, we are mighty and powerful magicians, would we only use the kind of magic wherewith we are endowed. We could remove mountains; it would not be difficult to do so. All these world-girdling oppressive ranges whereunder our minds are buried—fear, unrest, irritation, suspicion and distrust; it is they that hold the world distraught and recalcitrant; and we could go day by day piecemeal removing them all. All that science is there, waiting to be learned. We have learned to look upon those things as tedious virtues, whose practice ought to be as natural as the arts we acquired in babyhood, which we have long since forgotten acquiring. To disentangle human yarn; to help instead of hindering; to hurry ill qualities into oblivion, and not to inflame and worsen them with tactless treatment—all those things ought to be as natural to us as speech.

Tactless treatment? We might use a far unkind term. Why is it that we gossip?

Let us assign no philosophic validity to the practice, lay no flattering unction to our souls. Easy are the beginnings of hypocrisy; you only dare not face yourself, and dare not call your undaring cowardice. Cut yourself off in the midst of your neighbor-vivisection party with this thought—what a smug, oleaginous little creature are you, thus to be larding and fondling your own sweet self-righteousness, your sense of well-groomed, immaculate superiority. Was it you who thanked God in the market-place, that you were not as other men? In all gossip the implication is, how well it would be for So-and-so if he were as we are. Or rather, as I am; for no one need ever trust very far his fellow gossip; he is destined to carry abroad your failings, as you are his; you shall both feed your vanity on each other, each at the other's expense.

You gain no good out of any man's evil. No man's poison can ever be your meat. In publishing another's failings, one does but proclaim his own.

Question The great problem of the past as well as the present, has been how to live. In what way will Theosophy help in the solution?

Answer The great problem for the men of all times has been how to live. It is impossible to imagine any subject for thought or discussion which does not (when finally analysed) lead us back to this great parent of all problems.

And if we look closely at the branches of the tree of intellectual knowledge, we shall find that hidden within them lie problems of a deeper kind which touch the chords of the mystery of man's *real existence*. Joy and sorrow, pleasure and pain, success and failure, birth and decay, life and death, right and wrong, peace and passion, heaven and hell, altruism and selfishness, are the occult or hidden experiences of life, just as truly real as—nay more real than—the problems of the physical brain. They are less understood. They cannot be conveyed in words, for he who has not already felt a measure of their reality is blind and deaf and dead to their full existence. They are the problems of the *real Occultism*.

Most men are unaware that there is a Science in existence which deals with these problems. It has been unknown in the Western world for the last 2000 years. Carefully guarded from profanation by those who watch over the welfare of mankind, it has been proclaimed once more by H. P. Blavatsky, the messenger of those guardians. It is the Science of the Human Soul and its object is Peace and Good Will to Mankind.

The proclamation that there is such a real science as this, which has laws of its own, and which *any man* may study for himself, has been scoffed at and misunderstood. From the fact that it deals with the very essence of man's inner experiences it *must* be studied, each man for himself.

And there are thousands who have recognized the inestimable value of this new revelation. Many are the seekers after truth who have found at last a key to the mysteries of their being and are solving the problem of how to live.

This Kingly Science is the science of Theosophy, the Wisdom-Religion. STUDENT

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

Theosophy and the "Psychic Wave"

A WRITER from a Californian observatory to the columns of the *English Mechanic*, who was recently referred to in the *CENTURY PATH* as having speculated on the nature of the mysterious cosmic substance that is cold light or electricity, also writes concerning the "psychic wave" in modern thought. He says:

The mighty psychic wave or impulse now actuating the entire human race, spreading everywhere, has reached this peak. Thus, as if something wonderful had occurred, floods of letters suddenly appeared up here saying that the brain does not think—that it is a mere tool used by a thinker. . . . Mentalism is now greater than spectroscopy. . . . But how the people found it out at the same time in India, Europe, Australia, New Zealand and the United States . . . is a standing psychic mystery.

This again is testimony to the prevision of the Founders of the Theosophical Society and their messenger, H. P. Blavatsky; for it was largely to prepare for the coming of this wave that the Theosophical Society was founded. It was stated that such a wave would come, and that, if it came in the then condition of humanity, without any powerful moral influence to direct it, the result would be most disastrous for humanity. For humanity was fast in the bonds of selfishness and ignorance of the true laws of life. It was utilizing most of its discoveries for purposes which in the main tended towards the destruction of civilization. If psychic powers should come into its possession, it would utilize them in the same way and unimagined horrors would result. Fortunately we are now only concerned with a speculation as to what might have happened—nay, certainly would have happened—if the Theosophical Society had not been founded. But we have around us abundant indications from which to judge. The quantity of deleterious rubbish that is poured out, offering the public personal advantages, such as wealth, beauty, power over others, self-satisfaction, etc., to be attained by "psychic" practices, is well known to all. We may form some idea of what uses mesmerism would be put to in many quarters, were its power more generally available. Added to all this, there are of course many possibilities such as can easily be guessed but cannot decently be described.

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

But what has the Theosophical Society done? It has associated the idea of higher powers and human attainments with the idea of human solidarity, and inseparably connected the question of the development of man's inner faculties with the ideas of duty and helpfulness. The Theosophical Society, with its Headquarters at Point Loma, under the leadership of Katherine Tingley, has fulfilled the great purpose of H. P. Blavatsky by establishing on an irremovable basis a Society in which Occultism and Brotherhood are inseparably associated, and which works solely for the uplifting of humanity.

The consequence is that the motives and tendencies of various cults and movements come into clearer definition, so that people can determine whether or not they are working towards the uplifting of humanity. It is well indeed that there is a strong and responsible organization able to stand at the helm of this psychic movement and steer it; otherwise we should have had pandemonium by this time.

The Grave of Arthur

IF King Arthur ever lived it may be presumed that he ultimately died, and if so, was buried. Where? A correspondent of an English weekly quotes the following, from the *Annales de Margam*, dating early in the Thirteenth century:

The bones of the renowned Arthur, King of Britain, were discovered in a very ancient sarcophagus, near which stood two pyramids, on which were inscribed some letters, but which, on account of their barbarous and uncouth form, could not be read. The occasion of their being found was this: While some persons were digging the earth between the aforesaid pyramids, in order to bury a certain monk who had purchased permission to be buried there, they found a sarcophagus, in which they observed what appeared to be the bones of a woman, with the hair still undecayed, which being removed, they found another laid before the first, in which were the bones of a man; and having removed that also, they found a third below the other two, upon which was placed a leaden cross, on which was inscribed:

"Here lies buried the renowned King Arthur in the Island of Avalan." For that place being surrounded by marshes is called the Island of Avallon, that is, the Island of Apples; because an apple is called in British "aval." Then, opening this sarcophagus, they found the bones of the aforesaid Prince, very large and long, which the monks placed with due honours in a marble tomb within their church [of Glastonbury]. The first grave is said to have been that

of Queen Gwenever, the wife of the said Arthur, the second that of Modred, his nephew, and the third that of Arthur himself.

One is naturally full of questions which that account leaves unanswered. *How* ancient was the sarcophagus? Had it any markings, like those on the pyramids? And what was the shape of the leaden cross? Was it the *ankh*, laid on the breasts of dead Egyptian initiates? Or a svastika? Or a "Maltese cross," found sometimes on prehistoric tombs of Central and South America? *Was* it of "lead," and what was done with it and the sarcophagus? In what language was the inscription? What was in the pyramids?

The good old monks did not bother to investigate or record these matters. And what did they think of it? For Arthur was an initiate of very, very pre-Christian days, and the sarcophagus was nearly as "ancient" when it was found as it would be (is, if it exists somewhere) now.

The Uses of Forests

WELL-WOODED regions are the visible symbol of a healthy balance in nature.

Those who ever keep their eyes on the ground fail to perceive the vital meaning of woods and forests, and will sometimes say there is no clear evidence of their effect on rainfall. But forest regions of Africa, South America, and elsewhere have a copious annual rainfall. And their regulating effect in preventing floods from removing vegetable soil is great also. But there is much more of the utmost importance that is not so obvious to either engineer or agriculturist. The trees are, like human hair, the retainers, conservers, and distributors of the vital electric forces in earth and air, the breathing apparatus of the earth's life-forces. Destroy them with all their beauty, and human energy begins to stagnate. Like in the arid deserts in China and elsewhere, life becomes dry and formal and dead—asthmatic, glaring and materialistic in expression.

The Theosophical Address at Isis Theater

OWING to an unusually stormy evening, the usual Sunday evening meeting at the Isis Theater, San Diego, was postponed until the Sunday following.

William Q. Judge on Theosophy

THERE is something in the writings of W. Q. Judge, so simple, so direct, so convincing, that at once attracts the mind of the reader or listener, commanding his attention; and instinctively, or rather intuitively, the conviction is forced upon one that here is a man who speaks from knowledge, and that his words are not mere theory or opinion, but truth born of the experience of many lives.

He said:

Theosophy is that ocean of knowledge which spreads from shore to shore of the evolution of sentient beings; unfathomable in its deepest parts, it gives the greatest minds their fullest scope, yet, shallow enough at its shores, it will not overwhelm the understanding of a child.

One feels this to be so when studying his writings, for there is that which appeals to the understanding of the simplest minds, comprehensible by the mind of a child; yet containing lessons for the advanced student.

Read the two articles "Karma," and "Practical Theosophy." In the latter of these is advice so sorely needed in the present day when people are running wild after psychic powers, and the allurements of so-called occultism. Mr. Judge wrote this in 1890 and the words are as applicable today as then.

The practical Theosophist will do well if he follows the advice to spread, explain, and illustrate the laws of Karma and Reincarnation so that they may enter into the lives of the people. Technical occultism and the allurements of the Astral Light may be left for other times. Men's thoughts must be affected, and this can only be done now by giving them these two great laws. They not only explain many things, but they also have an inherent power due to their truth and their intimate connexion with man to compel attention.

From the article "Karma":

It is a great mistake to suppose that an individual is the mere puppet of the past, the helpless victim of fate. The law of Karma is not fatalism, and a little consideration will show that it is possible for an individual to affect his own Karma. . . . It is the attitude of mind which draws the Karmic cords tightly round the soul. It imprisons the aspirations and binds them with chains of difficulty and obstruction. It is desire that causes the past Karma to take form and shape and build the house of clay. It must be through non-attachment that the soul will burst through the walls of pain, it will be only through a change of mind that the Karmic burden will be lifted.

To the worldly man Karma is a stern Nemesis, to the spiritual man Karma unfolds itself in harmony with his highest aspirations. He will look with tranquility alike on past and future, neither dwelling with remorse on past sin nor living in expectation of reward for present action. F.

The Living Mother, Earth

THE men of modern times agree in ridiculing Pliny and the naturalists of ancient days who thought the earth was a huge ball-shaped animal, and yet these very scoffers, so contemptuously merry at the notion of the spheroid animal, were in their early, embryonic days nothing but simple cells and just as globular as Mother Earth. A study of the minerals on the surface of the earth seems to support the common view that

nourishment from fluids underneath, as trees absorb the water from the soil.

Madame Blavatsky in her *Secret Doctrine* teaches that the water circulation of the globe sustains a perfect correspondence with the blood of man. Just as the springs and subterranean rivers wind their way through channels underground, so flows the blood in artery and vein, and there exists a growing discontent with explanations based on rock-formation and the laws of fluid pressure. What shall we say then of petroleum, whose origin is utterly unknown? Is this another of the vital fluids of our much-enduring mother?

The earth is warm beneath the surface; but that implies no warrant for believing that the greater depths are incandescent. True, there is often a continuous rise in heat as we go down; but in some places, at a greater depth, the record shows a tendency to cool. The molten lava poured forth by volcanoes is no proof that earth's inside is melted rock, just as we cannot argue from the behavior of a boil that man's interior is formed of pus. Volcanoes, like cutaneous eruptions may be due to local inflammation. Who that observes a horse dislodge a fly by a convulsive twitching of the skin can fail to be reminded of an earthquake, when with a movement of impatience the huge animal confounds her parasite, vexatious man? The skin of man transpires carbonic acid gas and it is common knowledge that all cavities within the ground are, in the absence of free ventilation, filled with this poisonous gas so universally a product of the life of animals. The earth upon its journey is enfolded in an envelope of air, and is it merely fancy that inclines us to believe that persons entering a house on a wintry day carry a surrounding envelope of air that chills whomsoever they approach?

There is a daily rise and fall of barometric pressure, which our scientists have never yet explained; so that perhaps we may be pardoned if in this we see

suggestions of the slow and measured breathing of the planetary monster. The mode of nourishment may be by drinking in the stream of electrons poured forth by the sun, which, by a subtle alchemy within the crust, are changed to metals and secreted through the skin. For if light be the magnetic substance out of which all matter is woven, the vital sun-forces may be the shuttles.

These random thoughts have sprung to birth in consequence of a deep-seated wish to know. They are a modest contribution to a dark but fascinating theme. The "babes and sucklings" of Philosophy, engaged in artless prattle, sometimes emit stray sparks of truth that "wise and prudent" elders find to be as lights in a dark place. B. A. S.

Lomaland Photo. and Engraving Dept.

WINTER SCENE IN SWEDEN

we are living on a gigantic pebble of dead stone; *but the extreme outside of every animal consists of dessicated, lifeless scales*, and our profoundest borings in the crust have never reached a depth proportionate in thickness to the dead layer of the epidermic scales. All the essentials of landscape are displayed upon the skin; cañons and plains and mountain ranges formed of wrinkles. As our unwearied planet urges her way along her annual path, she is enveloped with a film of brine called "ocean," and in like manner is an athlete toiling on the race-track bathed in a salt solution which we call his "sweat." The forest areas of earth have their analogy in the hair-covered tracts upon the skin. The hairs, supported on their roots, derive their

Clipped from the Press Something about Sicily

FROM Greece, en route for Genoa, Italy, we made several stops along the Sicilian coast, our first call being at La Bella Catania. The names of the islands and cities seem especially suitable to the beautiful country—Sicily, Sicilian, Messina, Catania, Marsala—pleasing names, that are suggestive of music, sensuous climate, sweet wines, blushing fruits—all of which we found a part of Sicily. Catania is a perfect little city, lying at the foot of Mount Etna, with clean pavements, beautiful homes, blossoming parks. The rich dales, filled with orange and lemon groves, make a decided contrast to the dark, gloomy, and smoky mountains above. Catania is a smile, Etna a frown; Catania laughs, Etna groans.

A noticeable piece of statuary in Catania is that of an elephant, sculptured from the lava of Mount Etna. It stands in the public square, and is a life-like looking animal, with its white tusks hanging close to its black lava hide.

The soil in the greater part of Sicily is phenomenally fertile. In the valleys it is rich to the depth of thirty or forty feet, and in consequence little labor is necessary to raise the most bountiful crops. This is probably the reason why the people are willing to live so near Etna, notwithstanding its past history of massacre. It is as dangerous today as ever, ruling the country like a tyrant. The men, women and children however, appear in a prosperous condition, and lazily happy. They were fond of lying about on the hillsides, in the parks, and under the trees; figuratively speaking, the fruit falling into their mouths, and while eating the fruit, they look out upon the sea, drink in the opiated air, and care not for the threats of Etna, as they feel sure that one day in Sicily is as a thousand years in any other land.

Etna's cruelty dates back to 476 B. C., when it annihilated fifteen hundred people. During the seventeenth century it buried thirty thousand. Its last serious eruption was in 1879, when no lives were lost, but a large tract of valuable land was desolated. This volcano has a record of about eighty serious eruptions.

Our next stop was at Messina. Americans are quite familiar with the fruits and wines of Sicily; the Messina oranges, the Sicilian lemons, the juicy figs, and the ladies' favorite wine, Marsala, which they make in immense quantities, and yearly export five million gallons to India, England, and America.

Our next anchorage was at Palermo, the capital of Sicily. It is a handsome city, although it is very old and has passed through the usual experiences of eastern countries. Originally inhabited by the Phoenicians, then by the Greeks, then the Carthaginians held sway, then the Romans took possession, then the Goths; after them the Byzantine emperors lived there for a time in luxury, and also the Saracens.

I was persuaded to visit some old ruins at Taormina, in the province of Messina, and midway between Messina and Catania. We went by rail through a luxurious country, with far extending vineyards both on the right and on the left; the vines, as they bent with the weight of their offspring would have brought a smile to the face of Bacchus. Ancient Taormina was built 400 B. C. Near the old is built the new village of Taormina. From the station it looks like one building set upon a hill, but after miles of travel, the one building seems to separate into many. You enter a single street which is over a mile in length, at the top or end of which is a fashionable hotel. If you go along the roadway, as we did, it is necessary to enter the hotel from the roof, and proceed down stairs; if you come up by a narrow pathway, you can enter the hotel from the first floor. The day was fine and the view from the hotel superb. The sun shone brightly upon the sea, and the waves rippled beneath its rays in iridescent splendor. Etna loomed up in the distance, black and demon-like,

slightly relieved, however, by its cap of snow worn on its bumpy head. This view is said to be the finest in Sicily, and I doubt if there is a finer view in the world. The principal feature of the ruins is a theater. The guide-book says it is reckoned one of the most splendid ruins in Sicily—which seems a misnomer, as I cannot understand how there can be any splendor about ruins. This theater in ruins had a depressing effect on me, as did also the theater of Bacchus in Athens. It brings sadness rather than joy to see these wrecks of former splendor, and to look at the time-worn and mutilated marble seats, where once sat Alcibiades, Cato, and Cicero, together with the youth and beauty of their day.

I have visited the catacombs in many places, but for realism and horror, the catacombs of Palermo excel all others. An old monk was our guide; a fluffy hood was about his head; yards of rosary encircled his neck; keys were dangling about his person like bells; and a girdle of rope bound his waist. Old and white-bearded, he looked as though not belonging to this or the spirit world, but rather as a figure moving between the two. We followed him down into the dungeon palace of the dead, where the walks were well-paved, as seen by the help of a little daylight that had strayed in timidly, as though afraid. Thousands of skeletons were dressed up, and standing in rows, with cards attached to their fleshless hands bearing their names and a few lines of their history. Thousands of coffins were piled one upon another, with a glass partition showing the ghastly skull and remnants within. The sight was enough to make a skeptic of a saint, so dead—so everlastingly dead—were those regiments of people. Had the spirits left the bodies? Had they risen?

A carriage drive of two hours took us to the top of the hill, where stands the church "Mosaic." It is so named on account of the biblical history which is portrayed on the sides of the church in mosaic, representing the story of Adam and Eve, Noah and the ark, Jacob, slightly bald, ascending the ladder, and his reception by the Lord at the window of heaven. It is truly a mosaic church, even to the floor.

From Palermo we sailed over the bluest and most enchanting of seas, the Mediterranean, and into that harbor of beauty, the "Bay of Naples."

Frequently the death of thousands by famine, pestilence, or war, is but lightly noticed, yet a gloom was cast over Naples by the sudden loss of one life. Just before our arrival a gentleman, leaving his wife and three children at the Grand Hotel, Paris, came to Naples, in order to gratify a long-felt desire to ascend Mount Vesuvius. He felt pressed for time, and in consequence ascended the Mount the same afternoon of his arrival, with only a small boy as a guide. Vesuvius has often proved treacherous and has shown herself an enemy to life, as in this instance. The stranger ventured too near her fiery mouth, and turning half-way round, he called to the guide and remarked, "How singular, the earth seems moving." In an instant the earth had moved him out of sight, and the old saying was verified, "Ashes to ashes."

We left our steamer at Genoa, and after purchasing our tickets for Paris by the way of Turin, we used the few moments left us in Genoa admiring the monument erected near the station in honor of Christopher Columbus.

We remained only a few hours in Turin, but long enough to discover that it is justly called one of the five beautiful cities of Italy. I noticed there to my surprise, a church which evidently was not Roman Catholic. It proved to be Waldensian—sometimes called Vaudois. These early Protestant pilgrims seem to have been overshadowed by the spirit which moved Martin Luther, a later dissenter. They have been severely persecuted, but through all these centuries have proved true to their convictions, martyr-like, enduring their persecutions. Innocent VIII went to the extreme of issuing an order for their extermination. Their church in Turin today stands out as a gigantic monument of their super-

stitions. They receive much sympathy from England, and from Protestant countries, which contribute about three-fourths of their church income. They have been wofully scourged, shot and shell having diminished their number to some four thousand. Throughout Italy they have about forty-three churches. . . . (*The Truthseeker*, Jan. 30, 1909)

TO King Alfonso's initiative and encouragement more than to anything else is due the accomplishment of a feat which has attracted little attention on this side of the Atlantic, and yet which is destined to play an important role in the future history of Spain. It is the piercing of the Pyrenees by means of a tunnel. Hitherto the Pyrenees have formed an almost insurmountable barrier between Spain and the remainder of Europe. For the railroads connecting the Peninsular with the continental system ran only along the coast, on the west and on the east, where the great mountain range dips at either extremity into the sea.

Now, however, a tunnel has been constructed and inaugurated which pierces the Pyrenees almost in the middle and enables trains to be run right through from Pau to Saragossa, thus giving direct railroad communication between France and the center of Spain, where all the latter's most prosperous industries are situated. The ceremony of inauguration was attended by French and Spanish cabinet ministers, and merely questions of etiquette prevented the presence of King Alfonso, who has manifested so much interest in the enterprise. In fact, had it not been for his urging, his energy, and his enthusiasm, the work might still have continued, as it had remained for so long a mere subject of academic discussion. What with this and other public works, and the remarkable industrial and commercial progress of Spain during the last few years, to all of which Don Alfonso has contributed, he bids fair to remain on record as one of the most useful monarchs that have ever occupied the Iberian throne. (*Chicago Daily Tribune*)

A Sure and Certain Hope

A CHRISTIAN training predisposes us to look outside ourselves for help and to depend on blessings granted in response to our requests by an indulgent patron in the sky, so that we come in time to fancy that the Power which grants us favors which we have not earned, may equally withhold our just deserts according to his fancy or caprice. A mind thus shaken by uncertainty is apt to waver in its confidence and falter in its daily work.

We need to fortify ourselves with the conviction that our failure is impossible *while we persist in aspiration after better things* and try to make Theosophy effective in our lives. Our faults and failings may be mountains high; but liberation is a certainty if we but persevere. This hope is based on the bed-rock of common-sense and simple logic and should be dwelt upon until from being hope it grows into a certainty of adamant strength. Our evil habits that shut out the light are of our own creation. Born of our thought, made vital by our strong desire, they owe to us their life and to ourselves as their creators do they look for their support. If we withdraw our help, ceasing to feed them either by love or fear, their life-force ebbs away, and disconnected from the mind which gave them birth, they dwindle day by day and disappear.

If we adopt a new ideal, feeding and nursing it to vigorous life by our continued brooding thought, then as it grows, so will the foul brood of vampires starve and die. Our ultimate achievement is so certain and so sure, *if we persist*, that it need not be sought for nor solicited, but follows of itself. We are not pensioners nor paupers supplicating alms; but kingly men and warriors in a league with the Divine; yes, Gods ourselves, and what we wish for, that we can create by that Divine Omnipotence whose glory shines with fadeless splendor in our inmost selves.

SEMI-ALLEGORICAL CARTOON IN OIL BY CARL LARSSON THE SWEDISH ARTIST
REPRESENTING AN OUTDOOR SERVICE OF CADETS BEFORE DRILL

An Ancient Sun Myth of the Vancouver Indians

THE following legend, one of many treasured from time unrecorded by the Indians of Vancouver Island, is another interesting evidence of Theosophical truth as to man's origin and the origin and destiny of races. It bears a strange likeness to the old Norse traditions, again to some of the Greek, Hindû, and Egyptian myths that only Theosophy can explain. The transcript which follows, written down by a Student, has been read, and is vouched for as authentic, by the Wise Men of the tribe to which it belongs.

H. M.

His name was Klisalagita—just Sunmaker. People said that his father dwelt in the sky where his daily duty was to carry the Sun along the Sunpath, that the people of earth should ever have his life and light and warmth with them. The Sunmaker was never born, it is said, but one there was in the tribe whom he called his mother. She loved him, her only son, as she called him, but even she never quite understood him, because his ways were not as the ways of other Indian boys. They laughed at him and his ways and his silence. But he laughed with them and all were happy together, for he was happy all day long. The other boys left him alone a good deal and did not often ask him to join in their games, but this did not trouble him in the least.

Sunmaker needed no companions among the boys because everything that lived he made his friend. He talked with the flowers and the trees and the rocks; the rivers whispered merry tales to him of the mountains, and the sea told tales of lands afar. Never did he tire of asking questions, and strange were the things he learned, for the forests and winds and brooks told him all they knew, and the birds had no secrets from him. They knew his silence and they trusted him, as nature and nature's children know how to trust one who tells no secrets until he finds one who can really understand their meaning. Even the birds, those terrible chatterers, are silent when they see a man among them whom they do not know.

One day when he had grown to a hunter's age, Sunmaker asked his mother whence he came.

"Your home was in the sky before you came among the tribe," she said. "In the sky is the Sunmaker from whom you have your name. From him

you have your happy nature which makes men say you have the Sunmaker in your heart."

After this he was ever thinking of going to find his father in the sky, and he was more than ever away in the woods, although his mother did all she could to make him stay in the village and forget his wild ways. At last she thought that if he were married he might settle down and grow more contented among the tribe.

When she told Sunmaker that he ought to marry, he seemed pleased enough, but strange was his choice.

"I must have a wife of the rocks," said the Sunmaker. And his mother laughed. But she had put the idea in his head and he persisted.

So the mother sought in the stone country and found for him a stone princess. Nothing less than

THE voice of Truth—the "still small voice"
whose destiny it ever was to first preach in
the desert.

Helena Petrovna Blavatsky

a princess would she have for the Sunmaker, her son.

The Sunmaker's wife would not talk nor move, so Sunmaker struck her. And the stone princess being hard like other stones he only bruised his hands. So he grew tired and left her.

After awhile his mother told him again that he ought to take a wife.

"I will have a wife of the sea," he said. "Get me for a wife a daughter of the kelp." And his mother laughed. But a daughter of the kelp he would have. "The long brown tresses of the kelp are the sunlocks my wife shall have," he said.

And his mother took her canoe and sought him out a princess of the kelp for nothing less than a princess would she have for the Sunmaker, her son, whom she loved.

So he swam out to the kelp and his wife told him to cling fast to her. "The tide will come," she said, "and you will drift away, away."

The Sunmaker clung to the long brown tresses and the tide rose, but the kelp princess held fast to the rocks beneath the great water. The tide rose and rose as the Sunmaker clung there. Lower and lower he sank until he was nearly drowned in the swelling waters. At last his mother came in her canoe and

she found him with the life gone from his body.

Working and rubbing, moving his arms up and down without stopping, she brought the life back to him and the kelp princess saw him no more.

After this she persuaded him no more but left him to do whatever he wished.

In those days there were great monsters by land and sea, like huge serpents. Now they live only in the sea at great depths and rarely do they show themselves to mariners. But that they once lived on land all can see, for are not the great landslides and mountain rifts there to show where the Sisautl has passed?

Terrible is the Sisautl. His look will turn to stone all who look at him, and for the one who finds even a single scale from his back, it will work wonders of magic. Three heads he has, one at each end and one in the middle of his great coiling body. Terrible is he to meet, for what can the poor hunter do, who meets this dreadful enemy—the Sisautl?

And yet there is nothing that may not be overcome by the right means. So it is with the Sisautl. If ever the hunter meets this terrible monster, calmly and without fear must he put his hand behind his back, and in his hand he will find the hilt of the magic sword with which alone the Sisautl may be vanquished, even when he is yet a great way off, too far away for the hunter to gaze into his eyes and be turned into stone. One blow in the air with the magic sword and the Sisautl will vanish; both the monster and the sword disappear together. But ever where there is need the sword is at hand ready for the warrior to wield it, when its power is unconquerable.

(TO BE CONTINUED)

A Royal Art Exhibition

A LETTER from Paris states that a most novel art exhibition is being arranged in that city, in which only sculptures and paintings by royalty will be shown. Queen Amelie of Portugal will exhibit, also her young son, the King (who recently received honorable mention upon a painting which he exhibited under an assumed name). Others will be the Queens of Italy and Roumania, the Princesses of Denmark and of Schleswig-Holstein and a number of other royal personages. It is the first exclusively royal art-salon that has ever been arranged. STUDENT

Pageants and the Church

THE revival of the spirit of pageantry in England has now reached the Church and arrangements are progressing rapidly for the English Church Pageant, to be held in the grounds of Fulham Palace on six successive days in June next.

The significance of this revival has been dealt with in a previous issue (CENTURY PATH, vol. X, no. 39, p. 14). It is proposed here to review the last historical appearance of this spirit, to which is credited the origin of English drama.

Before the Norman Conquest the nearest approach to drama in English literature were simple dialogs between the soul and the body; but a century earlier rudimentary dramatic performances are said to have arisen in connexion with the ritual of the English Church. The Miracle Plays and Moralities are traced to this source. Of the latter, the simple dramatization of such a text as "Righteousness and Peace have kissed each other" grew into the range and sweep of *Everyman*, which has been so successfully presented and favorably received in England.

The earliest recorded Miracle Play is one on the subject of St. Katherine, about the close of the eleventh century.

It is very remarkable that at so early a date it was not played in the church, as we know, because Geoffrey borrowed from the sacristy copes which were unfortunately burnt the same day at his house. (*Intermediate Text-book of English Literature*, p. 115.)

The earliest Miracle Plays written by an Englishman are the work of Hilarius, a pupil of Abelard, about the time of Stephen. But they are in Latin, with refrains in Old French, and we have to wait until the following century for plays written entirely in the vernacular. It is again remarkable that "no English play which has been preserved to us contains any marks of its representation by clerical actors." But the Church soon realized the

value of this revival and attempted to confine it within her fold.

If it should be urged that the invariably religious form of these early attempts proves that they originated in the Church, it must be pointed out that in those times the Church was all-powerful and prescribed, so far as it could, an ecclesiastical form and limitation for all the creative efforts of human genius. The early painters, poets, and musicians did the best they could under the limitations, occasionally, throwing in, however, a *Bacchus* and

MARCH

HEY, alder, hang thy tassels out
This blue and golden morn;
And willow, show thy silver-plush,
Wild grape, thy scarlet thorn!

And velvet moss about the trees,
Lift every russet cup;
The dew is coming down this way,
With pearls to fill them up.

And birds, why tarry so a-South?
Spent is the bitter rain!
With messages of love and cheer
Come North, come North again.

Ella Higginson (Selected)

Ariadne, and the like, into the crowd of "Holy Families" and "Madonnas."

These plays, it must be remembered, were now beginning to take their place in literature and so might easily get beyond control of the Church—a fair sample of ecclesiastical pressure, and logic (!), being afforded by the following from William of Waddington:

Hyt ys forbode hym in the decre
Miracles for to make or se;
For miracles, gyf you begynne,
Hyt ys a gaderynt, a syght of synne.
He may yn the Cherche, thurgh thys resun,
Pley the resurrecyun; . . .
Gyf thou do it in weyys or grenys
A syght of synne truly hyt semys.

However, the drama—"whose end, both at the first and now, was and is, to hold as 'twere, the mirror up to nature; to show virtue her own feature, scorn her own image, and the very age and body of the time his form and pressure," and being therefore a living thing even in its incipient stages—soon broke away from its ecclesiastical bondage. As early as 1233 the parish clerks of London had added acting to the entertainments which their guilds were prepared to provide. The Church tried to suppress these plays but we read that on the public holidays, notably the feast of Corpus Christi, "the favorite form of popular entertainment was soon added to the religious procession, and eclipsed it in popular favor"! The revival soon burst its narrow bounds, though for a time "religious" scenes, calculated to enforce the dogmas of the Church, prevailed.

Starting with Christmas and Easter scenes, the performances were expanded with the growth of the guilds until complete series or cycles—from the (Biblical) Creation and the Fall of Man, through scenes from the Old and New Testaments, down to the Last Day and the Judgment—were developed. Four such cycles, the York, Towneley, Chester, and Coventry plays—in which the growth of the "common and realistic" (or secular, as opposed to religious) element may be variously traced—have come down to us. These cycles were immensely popular and were played, in the streets, until about the close of the 16th century.

The "Moralities" or morality plays were an advance on these Miracles by the invention of a plot, and led the way to the Elizabethan drama by the introduction of "properties" and scene-painting, and by the growth from a rigid series of somewhat disconnected pageants to incidents in the careers of allegorical personages such as the Virtues and the Vices. This last stage has left its imperishable impress on English literature in Spenser's *Faerie*

Lomaland Photo. and Engraving Dept.

KYLEMORE CASTLE, CONNEMARA, IRELAND

Queene, as the next stage of development did in Bunyan's *Pilgrim's Progress*. For it was an easy transition to real (if "fictitious") characters with moral nicknames; and finally — by the gradual substitution for the Virtues and Vices of actual historical or even contemporary people who were good illustrations of particular virtues and vices — to the old (real) dramas: tragedies, histories, and comedies, from which the allegorical personages were almost excluded, and to which Shakespeare was so greatly indebted.

As the last historical revival of the pageants was the prelude to the mighty outburst of genius in the spacious days of Elizabeth, when the discovery of a New World had kindled men's imagination to that white heat in which genius easily displays its tropical powers, culminating in the Shakespearean drama, may not the modern revival be the herald of a work that with the wider horizons of today shall still further enlarge men's conceptions and liberate them from narrow, peevish, and pessimistic views of life and their own capabilities?

The significance of the modern revival of the spirit of pageantry from the Theosophical standpoint, was dealt with in the previous article. How surely history repeats itself is shown by the Church Pageant which now follows the recent splendid series of historical pageants. The Church is, as ever, lumbering up behind popular movements — even, indeed, so far as to recommend, and in certain quarters to adopt, "Faith-healing," "Hypnotism" and so on. It is her own concern if she lose herself in these byways of error. But she may *not* now impose her limitations upon and claim credit for the beneficent forces of "the

New Order of the Ages" now making its quickening presence felt throughout the world, in all the walks of life.

Everywhere is movement, growth, expectancy: so beneficent indeed that two great modern revolutions, Norway-Sweden, and Turkey, have been accomplished peacefully, even fraternally. Some divine idea is in solution and needs but a turn of events perhaps to crystallize itself into practical forms of ideal beauty.

We have entered a new spiritual epoch, a world-wide outpouring of the divine *TheoSophia* through the Divine Helpers of humanity. This world-wide *Theosophical* movement has its nucleus in the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY so heroically established by H. P. Blavatsky in 1875; so faithfully preserved by her successor W. Q. Judge; and now so rapidly extending under its present Leader, Katherine Tingley, "for the benefit of the people of the earth and all creatures."

STUDENT

Protectiveness

AMONG these are the ones who knew her as a Sunday school teacher, as a punctual and prayerful attendant upon all religious services, as a young woman whose life was devoted to piety, as one of sweet, rather diffident personality, who did not indulge in even the lighter shades of dissipation. Mothers directed their daughters' attention to the quiet, seemingly earnest Sunday school teacher as a model of womanly refinement and excellence.

The above, clipped from a prominent Western daily, has reference not to some saintly, sincere worker for humanity's betterment, but to a woman sentenced to a State penitentiary for a term of seven years. Her crimes were

forgery, perjury, and what the judge described as "even worse — selfishness and ingratitude in being willing to save herself by swearing guilt upon one who had loyally befriended her when all others had failed." It might be added that twice before had she been convicted of forgery and perjury, but had succeeded in being placed on probation by pleading that she was really not guilty but "the victim of strange psychological influences" — the while she officiated as a Sunday school teacher!

Now, what is the lesson in a case such as this? One that neither theology nor science can explain although both have tried all down the ages. It is surely a warning to common humanity to use its eyes, inner and outer, to study a little way at least into the mysteries of human character, to search for and find a true philosophy of life, and to use, where hypocrisy stalks abroad, the protectiveness of soul-strength. Hypocrisy is only unbrotherliness running wild on a certain track, for this crowning sin has numberless ramifications, and it is as much a duty to protect humanity's soul-life by checking it as to save bodily life by stopping a runaway engine or the flood from a broken dam.

Knowledge alone gives power to recognize the dual aspects of human nature, the power to help and save the erring soul who crosses our path — if saving of it be possible — and if not, then the power to protect, protect, protect, until it finds itself without means to contaminate or prey upon a single one of humanity's children. The study of Theosophy alone can give it, for of all systems of philosophy now accessible in the world, it alone explains the mysteries of human conduct. H.

OUR YOUNG FOLK

THE MEADOWLARK

LONG before the fields are green,
Or the blus'tring winds are still,
Long before the waiting woodlands
Feel the thrill
Of the coming springtime,
If you listen, you shall hear,
In the open, windy places,
Sounding bravely, far and near:
Spring o' the year!

Long before the angry clouds
Cease to gather in the sky;
Long before the driving rainstorms
Hasten by;
In the dreary, sodden meadows,
All your heart-beats leap with cheer—
Hark, the meadowlark is singing
Song of gladness, piercing clear:
Sweet spring is here!

TERTIUS VAN DYKE in the
Nassau Literary Magazine (Princeton)

Music Hath Charms

"I DO not feel like forgiving them," and Minnie tossed her head and turned from the peacemaker.

Aunt Joyce sat there until the twilight faded into darkness. It was difficult to fill a mother's place to the turbulent young folk so long accustomed to go their own way. She smothered a sigh as she rang for lights and turned to the piano. She had not touched it for weeks, not in fact since she had come, at her brother's call, to take charge of his household. Aunt Joyce was an unknown quantity, and not a welcome addition to the house in the eyes of the young people and they had very little compunction about showing it.

Lost in the music to which her soul responded, she played on and on: unheard the footfall and unheeded the presence of her youngest nephew, Maurice. The last soft chord lovingly sounded, she turned her head suddenly to meet the wistful gaze of the little boy, his eyes tear-dimmed, though shining behind the veil. Harsh words from John had sent him towards his room for revenge, when the music—so seldom heard—swerved him aside.

"You love it too?" asked his aunt sympathetically.

"I never heard music like that before," the little fellow replied, "Minnie plays cake-walks sometimes, and John has a mouth organ."

Then Aunt Joyce began to tell him some things about music that he had never heard before, and illustrated her talk with musical extracts which so interested him that he made no comment on the entry of his late enemy, who also profited by the talk. Presently she drew both boys into conversation, and, before they realized it, they were eagerly singing catches and rounds with her. This proved too much for Minnie whose room was just overhead, and she too came slowly up to the piano, drawn as by a magnet. Aunt Joyce's heart sang a song of joy and never music

Lomaland Photo. and Engraving Dept.

MARDI GRAS AT CANNES

sounded so sweet in her ears as the blend of the three young voices. At the evening's close they all felt as if something new and beautiful had come into their lives; something that made them feel happier and better, and as Auntie bent and kissed them goodnight, all felt as if they had entered into a compact of mutual help and friendliness.

"So music is the key to the situation"; mused Aunt Joyce that night, "how happy I am that I made good use of my talent, else when the time came, I should not have been ready and my life would have been a broken link in the chain of active workers for universal brotherhood—the harvest wasting through the absence of the reaper." E. I. W.

SIMPLICITY is an uprightness of soul which checks all useless dwelling upon one's self and one's actions. . . . Simplicity consists in a just medium, in which we are neither too much excited, nor too sedate; the soul is not carried away by external things, so as to be unable to reflect; neither does it make those continual references to self which a jealous sense of its own excellence multiplies to infinity.—*Fénelon*

THERE are some who, when they have done you a favor, are always ready to demand credit for it. Others, if they are not forward to do this, yet secretly look upon you as indebted to them, and are well aware of what they have done. Others, still, seem not to know what they have done, but are like the vine which bears a cluster, and having thus produced its proper fruit, seeks nothing further.—*Marcus Aurelius*

Mardi Gras

MARDI GRAS, or Shrove Tuesday, is the last and gayest day of the Carnival preceding the forty days of Lent.

In America it is celebrated in the old French city of New Orleans and the festival is one of the most foreign sights to be seen in the United States. Every grade of society celebrates Mardi Gras in its own particular way. There are feasts, balls, operas, plays, and every known form of amusement and pleasure.

On the streets are scenes of revelry both beautiful and grotesque. Gay streamers and gorgeous hangings flaunt from every building; every balcony and window is crowded with merry faces; crowds of masqueraders are on the pavements pelting each other with confetti and fighting with flowers and sugar plums. The antics of the fantastic figures and parti-colored harlequins make the revelers shout with laughter and excitement. There is an un-

ending procession of richly decorated vehicles, triumphal cars, and magnificent "floats" drawn by horses harnessed and wreathed with flowers; there are the King and Queen of the Carnival in all their splendor.

From the elaborate display and revelry of the festival, it would seem as if all mankind were at high carnival this day and for the time united in the sole aim of being hilarious before saying farewell to the flesh for the forty Lenten days of fast and special penance to be passed before the Feast of Easter. L.

The Eiffel Tower

THIS stupendous structure is nearly 1000 feet high. The heavy iron frame work of which it is built, looks from a distance as if it were made of some slender material, woven into a delicate lace pattern against the sky, so graceful and well proportioned is the tower.

The four piers, of which the base of the tower consists, form a square of 336 feet. The ground thus partly enclosed is used as a park and promenade. There are three platforms at different heights of the tower and one can go to the top in an elevator and on the way up can stop and attend the theater or visit a restaurant, or do shopping. Indeed it is quite a little city built straight up into the air, and more than 1000 people can be accommodated there at one time.

The tower was built by a French engineer named Alexandre Gustave Eiffel, for the exhibition of 1889. During the last year or two it has been used for Wireless Telegraphy and for experiments with wind. EUGENIA

THE CHILDREN'S HOUR

A Brave and Tender Queen

HELENA is the name of the beautiful, dark-eyed Queen of Italy, whose courage and tender helpfulness have made her known the world over as a queen whose heart is full of love for her people.

Children everywhere must have heard of the earthquake and tidal wave that destroyed the cities of Reggio and Messina, and must know that many, many people lost their lives, while others lost their homes and were hurt by falling buildings and covered up for days by them in many cases. Nine days after the earthquake little boys and girls were dug out of the ruins, which had fallen over them but left them room to move a little, and thus able to find some oil to take as food.

Just as soon as the King and Queen heard of the earthquake they sailed away to the suffering cities and began to help in taking care of the people and in finding all those who were still living, wherever they might be hidden by the ruins and the rubbish.

The Queen put on the dress of a nurse and helped the doctors to bandage the wounds and relieve the pain of the sufferers. She prepared food for the children, who gathered around her in crowds. She did everything she could to comfort the poor, homeless little ones. One child was crying because her beloved dolly was lost. Perhaps you know how she felt, some of you little girls who would not dream of leaving your dolls behind if you only had a chance to save them. The Queen knew how the little girl felt and she looked about and found a few pieces of cloth and made a dolly with her own hands. The kind act comforted the lonely child.

One baby, only six months old, would have been left alone and forgotten, had it not been for the Queen. It was in a house by itself and the Queen heard it cry as she passed. The house was so turned upside down by the earthquake that the child could scarcely be found; but Queen Helena climbed about until she saw the little face peeping through a crevice and then she lifted the baby out and took it to a safe place.

This tender and unselfish royal lady is herself a very happy mother, with one little son and three bright-faced little daughters.

Queen Helena's own childhood was spent in Montenegro, and here among the hills she lived a healthful, outdoor life, just as simple in many ways as that of any child brought up in the country. Afterwards she and her sisters went to school in Russia where the beautiful young princess studied faithfully, becoming a fine linguist and a good musician, playing both piano and violin.

CHILDREN OF ITALY

SEVEN TIMES ONE

THERE'S no dew left on the daisies and clover;
There's no rain left in heaven;
I've said my "seven times" over and over,—
Seven times one are seven.

I am old—so old, I can write a letter;
My birthday lessons are done;
The lambs play always; they know no better;
They are only one times one.

O moon! in the night I have seen you,
And shining so round and low;
You were bright! ah, bright, but your light is failing;
You are nothing now but a bow!

You moon, you have done something wrong
in heaven,
That God has hidden your face;
I hope, if you have, you will be forgiven,
And shine again in your place.

O velvet bee! you're a dusty fellow,
You've powdered your legs with gold;
O brave marshmary buds, rich and yellow!
Give me your money to hold.

O columbine! open your folded wrapper,
Where two twin turtle-doves dwell;
O cuckoo-pint, toll me the purple clapper
That hangs in your clear green bell.

And show me your nest, with the young ones in it;
I will not steal them away;
I am old!—you may trust me, linnet, linnet;
I am seven times one to-day.

Jean Ingelow

Stepping-Stones

"A PENNY for your thoughts" said Miss Campbell cheerily to her niece Mabel who sat by the window looking thoughtfully into space.

"Do you know, Aunt Helen," said Mabel slowly, "that I cannot understand how our failures can be stepping-stones in our progress. When we wish so much to do only what is right, then we do or say something without thinking, which we see afterwards was such a mistake—oh, it is so discouraging! How can we progress by making failures?"

"Do you see that fly on your favorite picture?" asked her aunt. tioningly.

"Yes," answered Mabel, ques-

"Do you think the fly can see the picture very well from its position?"

"Why no, it is too close to the picture. I don't believe it can see any picture at all!" exclaimed Mabel.

"Well," answered Miss Campbell, "we are a great deal like that fly on the picture—we are too close to ourselves to see ourselves as we really are; therefore we make failures. But when we fail by doing or saying something

wrong, if we are honest and do not try to blame something or somebody else, but acknowledge that our mistake was due to some quality in our nature which we, perhaps, have never been really aware of before, then we can be more on guard against it ever after."

"Oh, now I see!" exclaimed Mabel. "We must look upon failures as warnings. We may look back often enough to learn to be cautious, but we need not bemoan."

"Yes, remember to read the warning and to heed it, then you can step forward fearlessly into the future."

AUDREY

A Perch of Safety

ONE day in Germany a swallow was flying about in great distress. A large hawk was pursuing it and the poor swallow was in danger of being the prey of the larger bird. Suddenly the swallow flew in at an open window, fluttered about the room, and at last perched itself on the head of a statue standing there. Here indeed the bird should have felt safe, for the room was a court room, and the figure on whose head it rested was a statue of Justice; and here it stayed until its enemy went away.

THE MYSTERIES OF THE HEART DOCTRINE

Prepared by
KATHERINE TINGLEY
AND HER PUPILS

*The Theosophical
book of the
Twentieth century*

Tells the story and the history of the
Theosophical Movement.

The prices are \$2 in cloth and \$1.00 in
paper, which barely cover the cost, for it is
printed and bound, not gaudily, but with
such carefulness and thoroughness of art
and craft as to make it unique among
modern edition books.

A New Scientific Nebular Hypothesis on Theosophical Lines

THE world is said to know little of its greatest men. May this not be often from the deliberate suppression of facts by writers of so-called history, owing to religious or political bias? Then, again, great men dwell on the summits whence they contemplate the broad earth and the sky, but the ignorant and the selfish cannot see them because they do not lift their eyes. In Helena P. Blavatsky's career the blindness of the multitude in failing to recognize an altogether unusual kind of greatness is clearly shown. She had the greatness of a Teacher who spoke from real knowledge, "with authority," and not from inference or probability. Yet so strange is human nature that we see many of the teachings which she first unveiled to the Western world being brought forward today by official spokesmen of modern thought, and respectfully considered by learned Societies, as the results of *original research*.

Unacknowledged

Indebtedness to Theosophy

We, students of H. P. Blavatsky's life and works, do not affirm, of course, that the university professors, journalists, or clergy, who are boldly advancing certain Theosophical teachings, which were given out by her thirty and more years ago, and which were ridiculed as "utterly unscientific" or unorthodox, are all readers of Theosophical literature, or are aware of the tremendous and world-wide activity of the Movement which has permeated modern thought with Theosophical ideas since H. P. Blavatsky struck the new chord. But students of Theosophy, members of the UNIVERSAL BROTHERHOOD AND THEOSOPIHICAL SOCIETY, the legitimate guardian of H. P. Blavatsky's good name, have a twofold reason for upholding her rightful claims to recognition, *i. e.*, gratitude for the light she brought, and the duty of keeping the public from being misled by extremists who use her name and the word Theosophy to sustain methods and principles to which she was firmly opposed, such as hypnotism and mediumism.

Teachings from the Divine Science

These preliminary remarks have been called forth by the announcement of a new scientific hypothesis of the origin of the Solar System, for which Professor T. J. J. See, a distinguished practical and mathematical astronomer, at present in charge of the United States Observatory at Mare Island, California, claims the authorship, and which has been favorably received by the Astronomical Society of the Pacific. Briefly put, Professor See's nebular theory,

which he believes will permanently supplant Laplace's, is that our Solar System was originally

a spiral nebula of much larger dimensions than at present, formed by the automatic coiling up under mutual gravitation of two or more streams of cosmic dust, which met in such a way as to produce a whirlwind motion about a center or vortex. As the nebula coiled up under its own mutual gravitation, the spirals were gradually drawn nearer and nearer together, and all the nuclei formed in these coils revolved in elliptical paths of large eccentricity. These original nuclei in the coiling streams were the beginning of the planets, which became larger by gathering up more cosmic dust, while at the same time their orbits were reduced in size and rounded up under the secular action of the resisting medium against which these bodies revolved, etc.

Opposite
Spiral
Forces

Professor See thinks that the circularity of Neptune's orbit, caused, *ex hypothesi*, by the friction of the newly-born planet with the vast nebulous atmosphere of "cosmic dust" extending far beyond its present orbit (which has thereby lost its eccentricity) proves the existence of other planets beyond Neptune, formed from the outermost portions of the former nebula. That vast quantities of nebulous matter surround lucid stars can be seen by an examination of the photographs of the Pleiades and other open clusters.

Leaving the subject of extra-Neptunian planets with merely the remark that H. P. Blavatsky said there were yet many undiscovered planets in our system, we must pass to the main point, *i. e.*, the common, and presumably contemporary, origin of the bodies of the Solar System from the nuclei or knots in the original spiral nebula.

The new hypothesis discards Laplace's suggestion that the planets were thrown off by a contracting Sun in the shape of enormous rings of nebulous matter, which ultimately condensed into planets. The discovery that several satellites travel, and probably Uranus and Neptune rotate, in the reverse direction from the rest of the planets, and other facts incompatible with the older theory, has killed it; but recent observations, particularly the unexpected demonstration that nearly all the nebulae (tens of thousands) are *spiral*-formed, with double centers and knots of denser substance on their branches, have thrown fresh light on the problem and have brought the latest theories of science very close to the ancient teachings of Theosophy, at least as far as the physical plane is concerned.

For good reasons H. P. Blavatsky con-

Modern Astronomy Challenged by Ancient

sidered the study of cosmic development a very important part of Theosophy, and in her writings she gives an outline of what she had learned from her Eastern Teachers, who have records of astronomical phenomena and means of observation unknown to Western scientists. What she writes is often rather of the nature of startling and thought-provoking ideas than of dry, text-book facts—ideas which lead thoughtful students to search into Nature's secrets on new lines—but the following quotations will show how clearly she anticipated recent discoveries of astro-physics.

Criticising Laplace, H. P. Blavatsky quotes a portion of a letter from one of her Teachers containing these words:

"The great men of science of the West, knowing . . . next to nothing either about cometary matter, . . . the nature of the nebulae, . . . are imprudent to speak so confidently as they do about 'the central mass of the Sun' whirling out into space planets, comets, and what not" . . . "We maintain that it (the Sun) evolves out only the *life-principle*, the Soul of these bodies, *giving and receiving* it back. . . ." (*The Secret Doctrine*, vol. I, p. 593.)

In another place in the same volume (p. 588) she makes a statement about planetary origin which is practically that which Professor See has worked out mathematically:

Another of the fallacies, from the Occult standpoint, embodied in the modern theory as it now stands, is the hypothesis that the Planets were all detached from the Sun; that they are bone of his bone, and flesh of his flesh; whereas the Sun and the Planets are only co-uterine brothers, having the same nebular origin, but in a different mode from that postulated by modern Astronomy.

In speaking of comets, whose origin and destiny are still quite unknown to science, H. P. Blavatsky says that the planetary nuclei began life under cometary conditions, having detached themselves from the storehouse of nebulous material upon being awakened into life—by "induction"—"by the freed principles of a just *deceased* sidereal body." After becoming luminous and sunlike they broke into pieces, and finally, "after many pregenetic battles fought by the growing planets, accounting for the seemingly disturbed position of several of their systems," they settled down to present conditions.

The birth of the celestial bodies in Space is compared to a crowd or multitude of "pilgrims" at the Festival of the "Fires" [in India]. Seven ascetics appear on the threshold of the temple with seven lighted sticks of incense. At the light of these the first row of pilgrims light their incense sticks. After which every ascetic begins whirling his stick around his head in space, and furnishes the rest with fire. (*The Secret Doctrine*, vol. I, p. 203.)

But there is something far deeper in the universe than the illusion of material form, and it is the intelligently-governed spiritual laws, the soul of things, to which H. P. Blavatsky drew the principal attention of her students, for the study of these leads to nobler living. Their duty, she said "lies with the Soul and Spirit of cosmic space, not merely with its illusive appearance and behavior," which alone are recognized by science. The material forms, according to the ancient Wisdom of the East, Theosophy, are the outward

expressions of Divine Forces, not self-moving automata. H. P. Blavatsky uses the Eastern term *Fohat* (in Egypt *Tum*, or Osiris as Creator), to designate the Divine Energy pulsating throughout the universe, building up, sustaining, and finally destroying, every temporary illusion, from Sun to crystal, all under intelligent, spiritual guidance.

Fohat is the name for the one underlying Force which manifests under the forms of electricity, light, heat, and numberless more interchangeable forces yet undiscovered. We read in *The Secret Doctrine*, (vol. I, p. 672):

All the Forces, such as Light, Heat, Electricity, etc., are called the "Gods"—esoterically. . . . This sentence, moreover, in Stanza VI "*Fohat sets in motion the primordial World-germs, or the aggregation of Cosmic atoms and matter, some one way, some the other way, in the opposite direction*,"—looks orthodox and Scientific enough. . . . *Fohat* turns with his two hands in contrary directions the "seed" and "the curds," or Cosmic matter; is turning, in clearer language, particles in a highly attenuated condition and nebulae.

In many places H. P. Blavatsky shows that the idea of whirlwind motion of vortices in primitive matter, from atom to nebula, and governed by the dual action or polarity of *Fohat* was known from remote antiquity. One of the discoveries which has astonished the scientific

world of late years is that the spiral nebulae have double centers, each with a coiling streamer of knotted or nucleated light-substance branching from it. Duality is a condition of manifestation, according to Theosophy, and the primary rotation was given, so we learn from the *Secret Doctrine*, by contrary movements in the nebulous substance, probably as Professor See believes, in two opposite directions or perhaps more.

" . . . These [the nebular masses] fought, and a great heat was developed by the encountering and collision which produced rotation . . ." (*The Secret Doctrine*, vol. I, p. 250.)

It is impossible to go into the question here as fully as its interest deserves; students must refer to *The Secret Doctrine* and other Theosophical works for a wealth of facts connected therewith, and for the clues to the parallelism between the cosmic process and the development of the human race and of the individual human being—all profoundly important subjects. Enough has been said to show that H. P. Blavatsky anticipated this most modern and reasonable theory of cosmic genesis, incomplete though it may be, and that she claimed no credit for it, saying that she invented nothing, but only handed on the knowledge with which she had been entrusted, and which had been lost to the general world.

The question must arise in every open mind: How did the ancients know these things? And if they knew so much and anticipated many of the grandest speculations and discoveries of modern times; and if it be true that many of their priceless gems of wisdom, both ethical and scientific, and clues to still more, are contained in the literature of Theosophy, why should we hold back from intelligent investigation of "the most serious movement of the age"; why indeed? ORION

Hypnotism in Religion

IN a church paper a clergyman has been analysing revivals, not from the "supernatural" point of view or from the "pathological" point of view, but from the "scientific" point of view.

He finds them to consist of—*hypnotism*.

The expectation of people is wrought up by weeks of elaborate preparation. The attention is fixed on some one subject, hymns that do not call forth any thought are sung and re-sung, an appeal from a leader of undoubted magnetism follows, an appeal filled with vivid imagination and strong feeling, and the result is that the unstable element is at once in a state of mind favorable to suggestion. Then they are asked to do the very last thing that emotionally inclined persons ought to do, viz., to lay aside their will. Perfect self-surrender is asked for. Then the suggestion is made. "Raise the hand! Rise! Rise! . . ."

This principle of hypnotic suggestion explains why often men of superficial character and ability have such mysterious influence over the revival crowd. Dr. Buckley wrote a few years ago an account of a noted criminal who by this same method caused almost an entire revival audience to be struck down under the influence of his sermon as though by the power of God, and later confessed himself to have been a mesmeric fraud. (*Reformed Church Review*)

Asked to lay aside their will. Perfect self-surrender. This is the great mistake. There are other forms of so-called religion that ask that of us. And their aim is the same—that they may hypnotize us. False religion appeals to people through the emotions, gets them into an ecstatic frame of mind, induces them to open wide the doors—then steps in and takes control. If it is only an evangelical revival, the influence wears off, because the revivalist passes on and does not stop to complete his work. But if the hypnotization is done by a great church with a permanent organization, the influence is more lasting; for, having once gotten the people hypnotized, it keeps them so, and then it may be of little use appealing to them—they are too stupefied.

Theosophy asks people to use their wills, not to surrender them. It invites them to use their intelligence. It enjoins them to guard against all emotional and ecstatic influences and to take a firm stand on common sense and poise of temperament. Theosophists do not want to get a following of hypnotized converts; they could not make any use of such. A Theosophist must stand on his own base, and be inspired only by a deep calm conviction that will keep him loyal to the universal cause of Truth, Light, and Liberation, through every discouragement. The appeal of Theosophy is to the intelligence and to the better nature of everyone. H. T. E.

Earthquake Augury

SOLIDARITY is something which includes all nature as well as man. Earthquake phenomena show that our bodies respond to finer forces, did we but know it; while the lower creation is consciously awake to them. The survivors state that during the night before the Sicilian earthquake they awoke with an uneasy feeling. On the eve of the shock there was a half hour when the birds, dogs and cattle evinced intense agitation. Horses neighed loudly. Dogs howled on board ships at anchor, and in the darkness of the night birds took to wheeling flight and uttered peculiar cries of alarm. It is childish to attribute such things to "microseismic movements"—especially on board ship! STUDENT

Some Views on XXth Century Problems

A Vengeful Deity

A CORRESPONDENT of the (London) *Daily Telegraph* writes that in a recent issue of the *Corriere d'Italia* appears a letter from a priest, drawing attention to "an extraordinary coincidence." It appears that there is a strong anti-clerical party in Messina, and this, on the eve of the earthquake, met and passed resolutions of hostility to "all religious principles." The priest then quotes from a humorous Messina journal, *Il Telefono*, which in its Christmas number published a parody of a hymn known as "Novena a Gesù Bambino"—"A nine-day devotion to the infant Jesus"—the parody ending with an invitation to the baby to send an earthquake. No conclusions are drawn; the priest seems to think they are too obvious to need writing.

But they are not, and we will take leave to draw them. Thus:

The Almighty God, irritated by some resolutions passed at a small meeting of a few people whom he had created, and by a parody which he had read in a comic paper, collaborated with his infant son to kill not only the few dozen of sinners but *two hundred thousand others*, some in an earthquake, some roasted to death in a fire; and to drive mad many thousand more with agony, terror and grief.

That is the kind of God, and the only kind of God—except the baby—preached to those people for centuries! What wonder that except in the towns, there and at Calabria, they had sunk into spiritual and physical and intellectual lethargy? What wonder that at last an anti-clerical and even anti-religious party arose, desperately trying to shake the people into thought? What wonder that it at last occurred to some one that the only way to stop the degradation of a nine-day period of fatuous devotion to an infant, prescribed as a religious ceremony for grown men and women, was to ridicule it?

This anti-"religious" party might very well retort upon the priest that the earthquake was the attempt of a merciful God to shatter the stagnant clerical atmosphere of the place and guide the people, if necessary through temporary atheism and denial, to *thought*. STUDENT

Caught Napping

TO be caught napping at a supreme moment may easily be the most terrible event in one's life. Time is not uniform; there are nodes in its continuity, critical instants between the before and the after, just as for an instant the kaleidoscope presents a pattern between two chaoses, a pattern with a center and a thousand radii. The inner consciousness of men is forever grouping and re-grouping itself in that way. There is the great group and within this the lesser ones. And at any moment, for that moment, some one of us may, unknown to himself, be the center of such a group; having, for the moment of that centrality, an almost commanding influence over the rest at the end of the radii or of its branchlets. We do not know when such moments come; we could not by any effort

of will produce them; they belong to that Law which is gradually working out a perfect harmony in human life.

The point is, what are we inwardly wishing and willing in that moment? Upon the slowly developed quality of inner character it depends whether the many at the ends of the radii are suddenly helped and encouraged in their lives and in their struggles, or as suddenly chilled. Some time, one of *them* will be the center, and then we shall get back what we sent.

The inner stream, the deep germ-plasm of consciousness, runs along beneath the superficial one of the moments. They gradually add to it; it is as it were their sediment. Two men may equally wish for a fine day tomorrow, equally enjoy their dinner and prefer this to that; equally like the possession of money; be very similar in all the little desires that pop up from moment to moment. But the *essence* of one, constituting the content of the deeper current, is always self, self, self; the quiet background to the other's changeful surface scenery of the moments, is altruism. And so, at the nodal moments, when there is a chance for light to go out from the center, the one gives nothing; there is only self; for it is men's center consciousnesses that are for that instant thrown into touch with one another.

This is only the deeper extension of the truth that a man at those supreme moments which may be any moment, shows what he really is, brings forth the fruit of his common thinking. The captain of every ship has been accustomed for years to think of the safety of his ship and her passengers; consequently at the moment of supreme danger he will be found so thinking and acting. Some corresponding moment of great trial comes to most of us, and then we show unmistakably to the world the kind of thought we had been really doing underneath our carefully polished conduct. The great moments are the resultant of the small. No man could lay down his life for others unless he had been accustomed on Monday and Tuesday to lay down his cigar or his knife and fork for them. The supreme moments lay bare the very roots of thought—to all men sometimes; to the Law always.

STUDENT

Vows in Silence

PERHAPS the best thing yet said about the "Cleveland Movement"—a Movement mainly among the young people, who pledge themselves to try for two weeks "to live like Christ"—comes from *The Central Christian Advocate*, in one phrase: "After all, such vows are well taken in solitude of silence."

For they are taken both to and by the higher, inner, part of the nature. If the young people think they take their vow to Jesus and that he helps, they must also consider that any help coming from outside must come inside before it can work; and that they only know Christ, can only have a conception of it, by that much of its essence, or its similitude,

which is within themselves. It is within themselves that they must really look first and last; the best of what they know of themselves takes the vow; it is taken to that higher best which, whilst within, they only know in little part. And it is really this which inspired them to the effort. There is a divine essence everywhere; Jesus, and humanity's great teachers in general, the founders of the great religions, were men who had assimilated it and blended it into their whole lives and minds. To the extent that anyone is doing the same, he is getting not only its help but their more differentiated help. The path to all of them is in to the individual's inward highest, the soul, which was from the first a part of that same essence and from the first has been pleading to the outer mind and personality to feel its presence and follow its promptings. Whoever tries to do so is, in bringing divine light into his outer life, bringing it down nearer to the lives of all, humanizing as it were, or differentiating its abstract divinity.

To take a vow outwardly, in words, may therefore easily be throwing strength away into the unlistening air. For the mental gaze is, by the very fact of words, almost certain to be turned out instead of in; and outward into words instead of inward into aspiration goes some of the will.

And the time limit was another mistake. Efforts are easy for a time limit, to be then almost invariably followed by a great reaction. The vow should be, not so much to *succeed* as to *try* henceforth, heedless, in a sense, of success or failure. The inner witness looks at the *attempt*, if it be honest. Some time it will succeed; but the immediate outcome is the resultant of the attempt *and* a thousand forces set at work in the past. If attention is fixed on the outcome, disappointment or humiliation at non-success may wreck the whole plan; fixed on the attempt, all is safe. No one need ever fail to attempt in any single instance; and the sum of them is victory.

STUDENT

The Ancient "Closer Students"

THE prospectus of an extremely influential English "Society for the Systematic Study of Human Character" remarks that

The ancient Greeks were closer students of what they called *Ethos*, the heart or soul of man, . . . than were the philosophers who succeeded them, not excluding even the great thinkers of the present day. . . . *Ethology*, the science of human character, is still a missing science.

Then why does not this new *Ethological Society* give some of its time to studying what those old "closer students" had found out? Plato, for instance, makes the soul a triple, the divine and eternal *nous*, the irrational *anoia*, and the *psyche*, who must choose which she will take as her companion. Plutarch does the same:

Man is compound; and they are mistaken who think him to be compounded of two parts only. For the *nous* as far exceeds the *psyche* as that is better and diviner than the (passional) *thumos*.

We commend these to the society, for home study and realization. STUDENT

Archaeology Palaeontology Ethnology

Skeleton of a Man Fifteen Feet High

THE papers report, under date of Feb. 2nd, that the skeleton of a man 15 feet high has been unearthed by a peon at a town ten miles southeast of the City of Mexico, and that it will probably be turned over to the national museum in Mexico. This find is stated to confirm an Aztec legend that years ago a giant race inhabited parts of the Mexican plateau. This story may not be true, or there may be some other explanation; but it is a fact that giant races have occupied the earth in the far past. They were the remnants of the Fourth or "Atlantean" Race, which preceded the present Fifth Race of humanity. Universal tradition speaks of these giants, and doubtless, as archaeology proceeds, we shall obtain more evidence than sceptics will be able to explain away. T.

Modern Culture in its Nursery Stage

IN order to contrast the view of history as seen by the eye of modern culture with that which Theosophy would present, one may take an illustration. Suppose a people to have been limited, for as long as they can remember, to the confines of a single city and its environs, the commerce of that settlement being confined entirely within itself and none of the inhabitants ever venturing far from its boundaries. And imagine that at some past time, not very long ago, there was a great earthquake followed by fire and plague, which wiped out ancient records and landmarks, leaving the survivors, ignorant and destitute, to build up their civilization anew on its ruins. They would be entirely ignorant of the existence of other cities. Such dim records and traditions as they would have preserved would be regarded as inconvenient and unwelcome exceptions to the even tenor of their accepted beliefs, and would therefore be rejected as fabulous. As they proceeded from the center of their city, where the great institutions of learning, industry and polite culture were located, they would find the streets becoming meaner and the people more ignorant and primitive. Without the city limits the houses would become fewer and fewer, the surroundings more and more wild, until at last there would be an uninhabited desert beyond which no one would ever have penetrated.

Now let some great and daring traveler, filled with dissatisfaction at the dull life of his countrymen, push across that desert and disappear for many years, returning at last with wonderful tales of other cities and other peoples, and showing the people where to look among their own old ruins for ancient documents and relics of a former commerce between them and the other cities. We have now a very fair illustration of the state of affairs when H. P. Blavatsky proclaimed Theosophy to the modern world.

The most important effect which would be produced by this extension of knowledge would be the broadening of ideas which it

Lomaland Photo. and Engraving Dept.
ANCIENT TOMBS AND TURKISH FORT
Near Amasia, Asia Minor. The modern dwellings
in the foreground overhang the river.

would necessitate in every department of thought. The inhabitants of our supposed city would have formulated strange narrow theories of the extent of human powers, the laws of Nature, the laws of political economy, and so on. Many of these ideas would of course be upset by the discovery of other cities with different climates, other kinds of people, other customs. And the need of giving up their old ideas would make the people reluctant to believe or admit the facts necessitating such a surrender. Here again the analogy holds good, *space* in our fable standing for *time* in the application of the fable. The isolated city represents our era and its culture; the other cities represent past civilizations, such as those whose records are now daily being disinterred.

And the point is that these archaeological discoveries necessitate a corresponding enlargement of our views in other respects. In particular we need to take a much more gracious and generous view of the capacity of human nature. Archaeology has shown us that the people living beyond the confines of our era and its scanty environs of history were not rude peasants and gypsies, but had cities of their own equal to ours and perhaps even greater. We know that they built on a scale of massiveness never since equaled, and that they had profound and comprehensive

erudition that was preserved in a symbolic mystery-language we cannot yet fathom. All this, and yet more that will certainly come in the near future, ought to convince us that the possibilities of human nature are much greater than we had thought, and rouse us from our self-depreciatory and yet self-satisfied insularity. Little does the world suspect the extent to which it is indebted to H. P. Blavatsky, who performed the Herculean task of administering to it a kindly yet vigorous shaking up, the after-effects of which we now see unfolding in detail as day succeeds day in this rapidly moving age. But people vigorously shaken up are apt to forget for the moment the duty of gratitude. STUDENT

Tardy Admissions about Writing and Homer

“THAT there was writing in ancient Greece before the introduction of the Phoenician alphabet is now generally acknowledged” says a reviewer in a very conservative paper. So this fact, being so respectably admitted, may be regarded as beyond every possibility of dispute, and the weight of evidence in favor of it must indeed be colossal. How Theosophists have had to fight for this fact in the past! There was once a time when —

Dugald Stewart and his colleagues, upon seeing that the discovery would also involve ethnological affinities, and damage the prestige of those sires of the world races — Shem, Ham and Japhet — denied in the face of fact that “Sanskrit had ever been a living, spoken language,” supporting the theory that “it was an invention of the Brāhmins, who had constructed their Sanskrit on the model of the Greek and Latin.” — *Five Years of Theosophy*, p. 318.

The fact that writing was known in India before the time when the Phoenicians were alleged to have invented it was awkward; but violence was done to Indian history to make it fit; and it was asserted that writing was unknown before Pānini, whose date was altered to a recent time. But in many parts of the world writings of various kinds are found graven upon prehistoric stones; to account for which, again, some have imagined the Phoenicians traveling all over the globe, even to America. But it is rather a stretch to imagine that the Phoenicians invented the characters on the temple walls of Central America!

The occasion of the above admission was a lecture by Dr. Evans, the excavator of Knossos, whose discoveries have so revolutionized scholastic ideas as to Grecian origins, and so confirmed the statements of Theosophical writers years ago.

An essay by Andrew Lang on Homer is also reviewed, and he says:

I am constrained to suppose that the Iliad and the Odyssey, on the whole, are the fruit of a single age.

This also is a decided improvement on some past doctrines that have been enunciated, to the effect that these epics are a collection of folk-lore songs from various ages, edited by Solon or Pisistratus; and on the “accretion” theory, according to which the Homeric poems are the growth of several ages. STUDENT

The Trend of Twentieth Century Science

Imitating Life

A SUNDAY newspaper gives a part of a broadside once more to "the creation of life" nonsense, founded upon some experiments of a French biologist. He found that the eggs of the sea-urchin could be made to do without fertilization, the fertilizing cell being replaced in two ways.

The development of the egg, he thinks, with some reason, is the result of a rhythmical process, consisting in the alternate solution and reformation of the membrane covering the nucleus and of its contained network, advance in structure doubtless taking place during the solution period and registered in the new formation or precipitation. The rhythm is normally set going by the fertilizing cell.

Tannin will precipitate or coagulate the membranes; acids will dissolve them. By a skilful employment of these two upon the unfertilized cells, the experimenter set going the same set of changes that would have been caused by the fertilizing cell, and the egg finally developed. In other cases, with equally successful result, he set them going by an electric current.

The secret of life remains, of course, about as far away as ever. Both cells are living, and do in the course of their lives and within their minute dimensions what the experimenter does with his batteries, test-tubes and bottles.

Life is consciousness, superintending the production of the physical forces and guiding their interplay towards a result; if a little bit of its work is done for it by a chemist or electrician, it will avail itself of the help. A child jumps from an impulse started within its subjective life-consciousness; it will also jump from an electric shock given to its legs. But in the first case it was its own life, conscious to it as joy, which engineered the production of that current which in both cases worked the muscles. And the consciousness knows in its own way the steps of the working though that way is not a mental way that goes into words and pictures and print.

STUDENT

Emotion as a Battery

TO chronicle a little bit of physiology learned without vivisection, and therefore perhaps not mislearned, is rather refreshing.

Possibly an absolutely emotionless man whose mind was a still vacancy, might be generating no electricity. The rest of us, whose minds work continuously, however futilely, and around whose every thought play the untiring sprites of feeling, do generate it. It is perhaps generated in the sympathetic nervous system; that is not known yet; but either, directly or by induction, it is immediately present in the skin. There it has been measured.

If two pointed metal poles, connected with a galvanic cell and having a galvanometer for measuring the current, are pressed firmly upon the skin a short distance apart, a current passes, the skin between the poles completing the circuit. The interest of the subject

in the experiment he is witnessing, lowers the electrical resistance of the skin. But very soon this rises to a normal, and the galvanometer needle stands still at a certain point.

Dr. Veraguth, who was conducting the experiments and who reports them in *Umschau*, happened to have an architect for his subject—a thin-skinned man, *morally* speaking. It happened that one of the architect's house plans had recently been subjected to criticism. The Doctor read to him a list of indifferent words, suddenly introducing the name of the critic and an expression he had used. Immediately the galvanometer showed a greatly lessened electric resistance of the skin. The same thing happened in the case of a student to whom was read the name of a town in which he had been arrested.

But the skin is not merely passive. With the rise of feeling it generates a current of its own. This was shown by repeating such experiments as the above but omitting the battery. In other words an electric current throughout the body is an objective expression of emotion.

The Doctor comments in advance upon proposals that will be made to use the discovery for the detection of crime, pointing out that an innocent man conscious of being under suspicion would yield exactly the same electrical reactions as a guilty one.

This is a genuine bit of work. It remains to prove, what everyone will know to be a fact, that the currents or electric states produced by such emotions as fear, anger, and hate, *lower* the vitality of the cells which produce them and through which they pass, perhaps kill some of them; whilst those resulting from their opposites, courage, good-feeling and the like, benefit. We shall meet physiology and ethics once more arm in arm in the market-place one day, chatting benignly upon human affairs.

May one venture to be superstitious enough to suggest that all electric currents and states, on the grand scale in nature, if followed back far enough to their root, would be found to result from change in nature-consciousness? Also that . . . but perhaps that will do for the time!

STUDENT

The Structure of the Atom

ANOTHER indication of atomic structure has been noted by the correspondent of an English scientific paper, suggested by Bode's law of planetary distances. Like that, it begins upon the number 4. This is the atomic weight of Helium. By adding to it the apparently irregular numbers 3, 4, 7, 8, 11, 12, 15, 16, there result the numbers 7, 8, 11, 12, 15, 16, 19, 20. These latter are atomic weights of the first line of elements in Mendelejeff's table, in order. The last number, the eighth, 20, is the atomic weight of neon, an inert element not in the septenary table as it first appeared. Adding the same set of numbers to 20, we get the atomic weights, in order, of the second line of the table, beginning with sodium and ending with Chlorine—seven, like the first line. The eighth

number, 16, added to 20, gives 36, *nearly* the atomic weight of another inert element, argon. Adding the same set of numbers to this, we get the third line of the table. And so on.

But the correspondence is not accurate, though accurate enough to show that a real law lies here. For instance lithium comes theoretically, in this scheme, to 7; as we find it, it is 7.03. Silicon is theoretically 28; accurately 28.4. Helium, neon and a few others are *quite* in accord with the theory; a few differ by one or two units; mostly the difference is in the decimals.

Why these small differences? Why are they also in Bode's law? Does it not seem evident that nature is not a rigid framework like a clock mechanism, made to go in the same way from beginning to end; but a living and slowly changing organism? The compounds we call elements are all engaged in *process*, not set for eternity; in the "imperfections" of their atomic weights, the non-wholenumberedness of them, we catch them in the act of passing in their immensely leisurely way from one stage to another. If they were all absolutely true to mathematics, set forever like the multiplication-table, they would be dead. Instead they are fluid, as Lucretius taught; moving for a purpose, to an end, as he did *not* teach—though maybe he surmised, or even knew, more than he wrote.

STUDENT

The Music of the Spheres

PROFESSOR KORN's discovery, that elastic spheres pulsating at very high rates in a non-elastic medium—he used rubber balls full of air, immersed in water—attract each other with a force inversely proportional to the square of the distance, is interesting but does not carry us much nearer to the solution of the problem of gravitation. He has got a fact, if it is one, but *why* did his swiftly pulsating rubber balls attract each other through the water?

Leaving that, however, he has got back to the Pythagorean music of the spheres. The theory is that the planets and suns are pulsating at a rate which is their fundamental, corresponding to the fundamental of a stretched string; and that as in the latter case the fundamental is accompanied by the swifter overtones. The fundamental would of course, as in the case of a bell or metal plate, be in some relation with size, density, and material, and would therefore be different for all the celestial spheres. If he can find what it is for the sun and planets, he will, according to Pythagoras, have the musical scale.

The fundamental pulses constitute, according to his experiments, the root of gravitational attraction. When the two bodies, thus drawn, get near enough, the overtones produce *their* effect, which is the opposite, repulsion. The theory requires, it will be noticed, an *inelastic* ether.

There is according to ancient philosophies, and Theosophy, an eternal cosmic thrill, the "Verbum," at once subjective and objective, taken up by all bodies and beings, who derive from it their life and their form. STUDENT

Living Crystals

IN the CENTURY PATH, number 9 of this volume, were some notes on "Solid Liquids and Liquid Crystals," in which it was explained how certain liquids may be caused to exhibit the optical phenomena (such as double refraction) characteristic of many solid crystals, a circumstance which entitles them to be called liquid crystals.

Some of these liquid crystals also exhibit phenomena very much resembling the movements of organic life. By the addition of certain substances to the simplest crystalline liquids, the liquid resulting from this is caused to separate into parts, which are shaped (according to the nature of the liquid) like drops, like crystal needles, or like worms. All these forms show a very strong tendency to move and to change their dimensions, by coalescence, subdivision, or absorption of the surrounding liquid. The drops usually rotate very rapidly, and the worm-like forms are so strikingly like living organisms that Lehmann has called them "apparently living crystals." But they require for their production a temperature high enough to kill ordinary organisms; nor are they permanently killed by being overheated, but resume their life when the temperature is lowered again.

There seems need of a discrimination between the different orders of life—mineral, vegetable, animal. This would enable one to say that the crystals had life, but not animal life or vegetable life—mineral life, in fact. Surely the things that mineral and so-called inorganic substances do in the ordinary way of business are marvelous enough on any other hypothesis than that of intelligent life; nor does this particular case of the worms require any explanation special to itself; we need to posit a vital principle in any case. The attempt to use the familiar laws governing the dynamics of large masses as explanations of the phenomena of molecular physics can not be said to have been successful; nor is this attempt candid, for if it were so, it would surely require that we should introduce into the molecular world little men, little horses, and little steam engines, to set the forces in motion. How did the motion and force get into the molecular world? There are some who seem to think that the world was formerly wound up to go. Others think that the words "affinity" or "attraction" are sufficient of an explanation. But attraction is a greater mystery than the most transcendental philosopher can produce. Science may be able to get along, once it is granted its atoms and its attraction; but this is granting it practically

A SPUR OF "SVARTISEN," ONE OF NORWAY'S GREATEST GLACIERS

MOTSATSER

Dikt av Konung Oscar II, skriven på Sveriges västkust

*Klippan bestormad av bölja på bölja
ser dem förvandlas till skummande snö.
Hård är graniten, vars mantel de skölja,
hjärtlös den barm, där de sucka och dö.*

*Men bakom krönet, i skydd emot vinden,
breder en spegelblank vattendam sig,
sällad med liljor, snövita om kinden,
skylande halvt sina kalkar för dig.*

*O märk, hur några alnars mått allena
kan skilja bränningen från dammen blid
och hindra båda att i kamp sig ena.*

*Sätt så till värn en klippfast sköld i tid,
när livets stormar hota att förmäna
dig andens jämvikt och ditt hjärtas frid.*

CONTRASTS

FROM THE SWEDISH OF KING OSCAR II,
written on the west coast of Sweden

Cliffs, here bestormed by the billows a-crashing,
See these transformed into snow foaming high.
Granite so gruesome, whose mantle they're lashing,
Stern seems of bosom where sighing they die.

Back of the crest though, secure from wind-battles,
Stretches a restful and mirror-like lake
Sprinkled with lily flowers snow-white on petals
Half hiding stilly their cups for thy sake.

O mark, how here the distance short extending
Can part the fearful surf from tranquil pool,
And bar them clear from futile warfare blending.

So be on guard, with shield rock-firm and cool,
When tempests hard assail thee, e'er defending
The soul, and ardent joy and peace will rule.

Translated by F. J. D.

everything. That attraction, says Theosophy, is the evidence of conscious life—not conscious life as it is in the animal or the plant, but still part of the cosmic soul. STUDENT

Mineral Life

SO rapid is now the progress of thought that it takes a few years only for the bold and heterodox speculations of the pioneers in scientific research to find their way into the columns of orthodox opinion and receive the sanction of accepted authority. It is surely not long since such an idea as that minerals and metals exhibit vital phenomena was considered most unorthodox and fantastic; but now it commands the serious attention of accredited organs of opinion.

A writer in the London *Lancet* speaks of the "diseases of metals." Metals behave in many respects

like "organic" bodies. Tin crumbles to a gray powder, if exposed for a long time to the cold, the phenomenon being known as "tin plague." Tin plague is even infectious; for, if masses of smooth polished tin are inoculated with some of the diseased variety, the disease spreads. The fact that certain metals have "illnesses" is also mentioned, together with the fact that metals can be poisoned. Platinum in its colloidal form is extremely active; but by means of prussic acid or corrosive sublimate it may be deprived of all its energy—in fact, killed.

Dead matter is a figment of the scientific brain. The attempt to separate living substance into dead matter and force has resulted in demonstrating the imaginary character of both these components. All matter is alive, but we fail to analyse it into two constituents called matter and life. The two are inseparable and are always found together. We find that hard rocks and stones are continually, if slowly, performing architectural operations within themselves, crystallizing, forming concretions, segregating, and so on. They grow and change, only more slowly and with less variety than the higher kingdoms. The question of the organic life of minerals opens out before the eyes of science. It is the universal life in another scale of manifestation. Possibly the fact of regarding metals and stones as organic may be the clue to discovering some secrets in the art of utilizing them which the world has forgotten. If, instead of speaking about the *properties* of substances, we said *dispositions*, this might help us to consider the possible effect of *humoring* those dispositions, and thus the state of mind or the temperament of the operator might be allowed to count for something. Then we shall have experiments which will work with some operators and fail with others; as perhaps was the case with the "N-rays." And a probationary training in health, habits, and character will precede research. STUDENT

Students'

Path

Theosophy for Young Men and Women

The world wants men—large-hearted, manly men,
Men who shall join its chorus and prolong
The psalm of labor and the psalm of love.

The age wants heroes—heroes who shall dare
To struggle in the solid ranks of Truth;
To clutch the monster error by the throat;
To bear opinion to a loftier seat;
To blot the era of oppression out,
And lead a universal freedom in.—Anon

Would that women better understood their
possibilities, their obligations, their Divine Power
to shape all things for righteousness!

Katherine Tingley

LOOKING at the average young men and women of today as we meet them in the home, in the street, in society and in business, and as students in the various schools and colleges with which our country abounds, how do they impress one? Do they appear to be building characters of such strength and nobility as will enable them to meet the exigencies of their own lives and of their community and country in the best way? What are their moral standards? Have they high ideals? Are their principles established upon a knowledge of their own natures and what is rightfully due to themselves and others?

As we look into their faces and listen to their conversation and observe their conduct, we see, alas! little to indicate that they are conscious of any particular responsibility for the well-being of humanity. Among them we would scarcely expect to find moral leaders for the future, unless something awakens them to an understanding of life and its purpose. They do not know whence they came, whither they are going, or why they are here, and they are ignorant of what constitutes true manhood and womanhood.

From early childhood many of these young people have been taught by example if not by actual instruction to get all they can, for nothing if possible, and at all events to give as little as they can in return, to outdo and overreach others, and to base their acts upon expediency rather than on principle. When they take up larger interests and exert a wider influence can we expect them to adopt any different line of conduct? Surely they will continue trying to get the better of their neighbors if it can be done legally or without discovery. This selfishness works through all their relations with others. The numerous devices for trapping the unwary and getting their money to swell the bank accounts of the promoters; the poor service given for wage, unless employees are constantly watched; the great number of unhappy marriages and wrecked homes; the dissipation, love of excitement and sensation, which lead the young into immorality and degradation—all these things may well make us tremble for the future of our young people.

Where lies the responsibility for these conditions, and is there a remedy?

The great majority of homes, schools, and churches exert no strong, positive, uplifting influence that really helps the higher natures of the young to express themselves. The church, which has been supposed to point the way to a righteous life, has lost its hold upon this generation and fails to reach a great number of the young people. They have not much use for religion as it is there presented, and if nominally accepting it, their lives are not

perceptibly affected thereby. It offers no satisfactory explanation of this life, and its pictures of the next state of existence have no attractions. The goodness there taught does not appeal to sprightly young people but repels them as uninteresting and undesirable. "Why," said a man recently, "if we all lived up to the best we knew we should be too good for this world and go up higher." This reminds us of the old-time Sunday school story books in which the good children always died young while the bad ones lived long and had a good time. So children did not dare to be as good as they could lest they should be transformed into angels with "crowns upon their foreheads and harps with-in their hands."

In the homes, where the influences should be most helpful and inspiring, physical comforts and enjoyment appear to monopolize the time and attention, and little thought is given to anything other than the body and mind, so the neglected soul becomes lean and shriveled. Among those in moderate circumstances, parents who have been overworked and deprived of the pleasures of youth frequently say, "My sons and daughters shall have a good time," which means license to do as they please unchecked by parental authority, and results in producing irresponsible and oftentimes vicious men and women.

Ethics of a certain kind are taught in the educational institutions, but apparently greater attention is given to developing body and mind, with strong emphasis on the former. Dr. Sargent of Harvard, in a recent lecture said that "the great colleges are just waking up to the fact that they are drawing to their halls *student athletes* instead of *athletic students*." By all means give the body plenty of proper exercise and the mind opportunity for development, but at the same time give the soul an equal chance to do its work, O ye instructors of youth!

The standards of society will be no higher than those of the individuals composing it, and we find there false ideas and ideals, unmoral standards, fictitious enjoyments and imaginary happiness dependent upon continual excitement. Caught in this whirlpool the young person is not permitted to think, his principles weaken, and if his bark is dashed against some rock of temptation and goes down, need we be surprised?

The prime cause of these conditions is selfishness, and the responsibility rests upon the whole system of life and thought which prevail at present. It is based upon ignorance of the vital principles of right living.

Is it possible to offer to the young men and women of the Twentieth century anything that will lift them out of these conditions and give them something that is worth having?

We who have caught glimpses of the sublime truths of Theosophy do not hesitate to say that it is the only thing that can rescue them. We know that if our youth could have been illumined by these truths many pitfalls might have been avoided or passed safely over, where in the darkness we stumbled or fell, and we would have developed stronger and more helpful characters than we now have.

We have heard and read of its inestimable value to the children who are so fortunate as to live under the influence of its teachings, and we are told what kind of men and women we may expect from these children. What message has Theosophy for those whose childhood has not thus been blessed?

It brings a message of hope, of love and of encouragement. It is thoroughly practical and can be applied to every department of life, for it is the Science of Right Living. It offers a solution to all the questions which puzzle young minds in regard to their origin and destiny, the purpose of life and of present conditions. It explains their limitations and teaches how to overcome them. It opens new and most attractive fields for thought and investigation. To the student it furnishes the key to the sciences, to history, and to all the 'osophies and 'ologies and 'isms over which he is poring so laboriously. It teaches Life is Joy, and anything that is

not joyous is not really living. It will take from the young no enjoyment that is worth having, and will give a keen zest to all their pleasures. It does not teach negative goodness, but inspires its students to be good for something, and bids them fear nothing.

Theosophy brings the knowledge that we are immortal souls who have helped to fashion our bodies and tried to make them suitable instruments through which we may learn life's lessons. Having this knowledge, do you think that the young would misuse and abuse their bodies as they now do?

It gives convincing reasons for belief in our divinity and the possibility of ultimately attaining perfect manhood and womanhood, and this will surely be an inspiration to every young person who is capable of holding such a belief, "giving the power to overcome all obstacles and to dare to do right."

The knowledge of the dual nature will enable a young man or woman to understand whence come the impulses to right and wrong thoughts and acts, and the deeper knowledge of their natures which is taught by Theosophy will warn of the great danger in yielding to the lower tendencies, and the importance of dealing with them decisively when they begin to assert themselves. It will be understood that to allow oneself to be swayed by any emotion is injurious to the physical and mental health. Knowing the power of thought, one will endeavor to fill the mind with healthful and helpful thoughts and refuse to harbor unhappy, unkind or unwholesome ones. Moods will not be permitted for they undermine the character and health. He will understand that "the forces of passion, if manfully resisted, turn themselves into stepping stones by which we mount to greater heights; but, if indulged, they drag us still further down."

The law of Karma decrees that from sowing "wild oats" one cannot reap a harvest of golden grain, for "whatsoever ye sow that shall ye reap." The law which rules in the physical world is equally potent in the moral world, and a knowledge of this makes clear many of the perplexing things in the present life.

Karma and Reincarnation enable one to understand many otherwise unexplainable tendencies, desires and limitations in oneself and others, and explain the unaccountable attractions and repulsions frequently experienced by young people, which are doubtless due to associations and relations in other lives. These twin laws give encouragement to greater effort in developing talents because there is the assurance that whether much or little is accomplished in this life ample opportunities will be given in other lives to go on, and greater patience will result. Now people feel impelled to rush and scramble and try to do everything at once because they think there is only this one little life for them, and patience is not one of the virtues of this age.

The knowledge that Brotherhood is not a mere sentiment but a fundamental fact in Nature, and that the solidarity of mankind is such that nothing that affects one can fail to affect all, will certainly make the young more considerate of each other. It will give a deeper conception of duty, honesty, the importance of self-control and self-sacrifice.

To students congregated by thousands in colleges and universities, living under new conditions and subjected to diverse influences and temptations, removed from the restraint of home and friends, and left to themselves to stand or fall, Theosophy is of inestimable value. It gives the highest ideals. It explains life in all its phases. It teaches how to develop courage, self-control, concentration, alertness and adaptability, and will be a wondrous help to those young men and women in keeping themselves up to the best standards of work.

To the genius struggling with adverse circumstances it gives new courage. Said a young artist whose ardor had been dampened and faith in justice shaken by the sordidness and lack of appreciation which she had encountered, "I think I shall be forced to accept Theosophy, it explains so many things."

To those who aspire to instruct children it says, "You must teach by example. Unless the teacher's life corresponds with the teaching the latter will avail nothing. Those who deal with children must overcome their faults and selfishness and keep their lives as pure as possible, that the little ones may not be contaminated by wrong thoughts and influences." The lessons taught by example and silent influence are deeper and more lasting than any instruction in mathematics or language.

Theosophy is especially needed by those just entering the business world, for many are the traps and pitfalls in which they may be caught unless prepared by right ideas and habits of right action. The conditions are such that it is very difficult to be unselfish, just, and generous, and to practise true Brotherhood. But with this help a young man may win honorable success without injustice to his associates or sacrifice of principle, for straight-forward methods and conscientious and untiring devotion to his work and the legitimate interests of his business will bring satisfactory results.

And the need is imperative for a wide-spread, enthusiastic and intelligent knowledge of and devotion to the principles of Universal Brotherhood upon which the Theosophical Society is founded, if harmonious national and international relations are to be preserved. With Katherine Tingley we exclaim, "How my heart craves for the response of the masses to this Science of Life! I declare to you that could it once be realized and lived in all its superb strength and helpfulness, we would indeed be a family royal in our humanity!" H. F. M.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question Is there any difference between intuition and discrimination? What place do these have in human development? Will the Theosophical Forum please answer.

Answer It is easy to say yes, to the first part of the question, but not so easy to show wherein the difference lies. These two faculties seem to be very closely related, and both to be powers of the Higher Nature; in other words, faculties of the divine or spiritual soul. Using the term soul in its three aspects as is done by H. P. Blavatsky in *The Key to Theosophy*, we find the lowest aspect, the animal soul swayed and urged to act by passion and emotion. This is expressed in the *Bhagavad Gītā*, where mention is made of the hungry man, who, it is said, "loseth sight of every object but the gratification of his appetite"—*hunger* being evidently used as a type of personal desire of whatever kind. The personal man is governed by desire, by hunger in one form or another, whether for food, drink, sensation of whatever kind, or for fame, personal recognition, or power.

But the personal man, the passions and desires of the lower, animal soul, may be controlled by means of the mind, the function of which is to reason and reflect, which can look back into the past and remember the results of past acts, and can look forward into the future and reason that similar results will follow the committal of like deeds; which can weigh and balance, put this against that, and by argument and ratiocination laboriously seek to arrive at the truth. It is the distinguishing faculty of the human soul. The *Bhagavad Gītā* speaks of it as being the instrument by which the animal soul must be controlled.

When he hath abandoned every desire that ariseth from the imagination and subdued with the mind the senses and organs which impel to action in every direction, being possessed of patience, he by degrees finds rest.

But man is more than the animal soul and greater than the human soul; he is a spiritual, divine being. This is his true nature, the other two natures of the trinity are but instruments for his experience in their own realms respectively. But such experience is of no true value unless these two natures are guided, and overruled by the divine nature. Did we live in this highest part of our complex natures, were we fully cognizant of our divinity, we should no longer feel the overpowering hunger of the lower nature and its demand for satisfaction, natural enough in the animals in accordance with their development, but abnormal in man and, where given way to, a mark or premonition of degeneracy. Nor, did we realize to the full the spiritual nature of the soul, should we require to go through the long process of argumentation and laborious reasoning in order to arrive at the possible truth.

Indeed by this process we can never arrive at more than possible truth, for there is always the possibility of error in the process unless fully guided by the higher, spiritual faculties. And to know the truth really, these other faculties must be brought into play. We do even now to a very limited extent use them; but in the light of the teachings of Theosophy and the vast realms thus opened out to us, it may well be asked if we know more than the mere A B C of their power—so strong are the calls of passion, and so delusive the subtle argumentation of the lower mind.

But there are some things that we know without the exercise of the reasoning faculties; there are some situations, apparently new to us, in which nevertheless we know how to act; there are some questions that come before us and immediately, without any examination of *pros* and *cons*, we know and decide. In other words, we have the faculties or powers of intuition, discrimination, judgment. And these faculties, it would seem, we are right in ascribing to the higher nature.

Let us turn again to the *Bhagavad Gītā*, that inexhaustible treasure of philosophy, and see the relation of these faculties to the powers of the mind and the personal nature.

The senses and organs are esteemed great, but the thinking self is greater than they. The discriminating principle [this, explains William Q. Judge, in a footnote, is *Buddhi*] is greater than the thinking self, and that which is greater than the discriminating principle is He [the Supreme Spirit, the true Ego, says W. Q. Judge]. Thus knowing what is greater than the discriminating principle and strengthening the lower by the Higher Self, do thou of mighty arms slay this foe which is formed of desire and is difficult to seize.

And to complete the first quotation given above in regard to the hungry man:

and when he is become acquainted with the Supreme, he loseth all taste for objects of whatever kind. The tumultuous senses and organs hurry away by force the heart even of the wise man who striveth after perfection. Let a man, restraining all these, remain in devotion at rest in me, his true self; for he who hath his senses and organs in control possesses spiritual knowledge.

And then Krishna gives this remarkable chain in the downfall of a human being, showing how closely related are all the faculties and powers of the soul, in its three aspects, reminding one too of the words of Jesus, full of an inner meaning, that one needeth not save to wash his feet and is clean every whit.

He who attendeth to the inclinations of the sens-

es, in them hath a concern; from this concern is created passion, from passion anger, from anger is produced delusion, from delusion a loss of the memory, from the loss of the memory loss of discrimination, and from loss of discrimination loss of all!

How may one attain to this spiritual knowledge, the handmaidens of which are these higher faculties of the soul?—and the answer given by Krishna is,

by doing service, by strong search, by asking questions, and by humility. . . . There is no purifier in this world to be compared to spiritual knowledge; and he who is perfected in devotion findeth spiritual knowledge springing up spontaneously in himself in the progress of time. The man who restraineth the senses and organs and hath faith obtaineth spiritual knowledge.

Many other quotations might be given helping to throw light upon the diviner side of our human-divine nature and its faculties. As to any difference that may exist between intuition and discrimination, the following is offered only as a possible aid to an answer. Intuition is, we may say, the direct knowledge that is at times experienced in regard to anything without reference to anything else; whereas discrimination seems to imply the power of choice and judgment between two or more things. It would appear that we all are able to evoke in degree this power of discrimination; indeed it is something that we as human beings, and more especially as spiritual beings, are called upon to exercise. As to how far and how surely we can exercise it depends upon us, not at any particular time, but upon the whole tenor of our lives. And so too with the faculty of intuition, which in one sense is the voice of conscience, it is as it were the true soul, our own spiritual selves, attempting to speak to us and make us understand and see what is the right and the true; the power to make itself heard depends upon ourselves, upon our so purifying our lives that its finer tones may fall upon our willing ears. For, as Krishna declares in *Bhagavad Gītā*, as the flame is surrounded by smoke, and a mirror by rust, and as the womb envelopes the fetus, so is the universe surrounded by this passion (lust, desire). By this—the constant enemy of the wise man, formed from desire which rageth like fire and is never to be appeased—is discriminative knowledge surrounded. Its empire is over the senses and organs, the thinking principle and the discriminative faculty also; by means of these it cloudeth discrimination and deludeth the Lord of the body. Therefore, at the very outset restraining thy senses, thou shouldst conquer this sin which is the destroyer of knowledge and of spiritual discernment.

And that which the exercise of these spiritual faculties leads to, the object of it all is declared in the following wonderful description from the same ancient scripture:

I will now tell thee what is the object of wisdom, from knowing which a man enjoys immortality; it is that which has no beginning, even the supreme Brahma, and of which it cannot be said that it is either Being or Non-Being. It has hands and feet in all directions; eyes, heads, mouths and ears in every direction; it is immanent in the world, possessing the vast whole. Itself without organs, it is reflected by all the senses and faculties; unattached, yet supporting all; without qualities, yet the witness of them all. It is within and without all creatures animate and inanimate; it is inconceivable because of its subtlety, and although near it is afar off. Although undivided it appeareth as divided among creatures, and while it sustains existing things, it is also to be known as their destroyer and creator. It is the light of all lights, and is declared to be beyond all darkness; and it is wisdom itself, the object of wisdom, and that which is to be attained by wisdom; in the hearts of all it ever presideth.

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

The Philosophy of Compassion

ONE would think that the churches as a whole, looking round year by year upon the world as it is, would be constantly asking themselves, Where have we failed in our duty? But this they rarely do. Some of them spend a good deal of public time in asking themselves, or in pointing out, where the *others* have failed in their duty, or why the people, by refusing to listen, have failed in theirs.

What a cumulative power has a thought sustained, whether in the life of a man or an epoch! The churches gave us to hold through the centuries, the thought that we were nothings, worms. We held it—and the world is as it is! Suppose they had given us the thought that we were *victims*, and unnecessarily so, and explained of what. That thought, sustained, would certainly have led to a most splendid conflict. The fighting instinct would have been aroused to a fine purpose, and we might by now have made ourselves *free*! For we have it on good authority that such is the effect of truth. We might be actually living as souls in a promising prelude to the millennium. Let us then, unaided by the churches, find out what this freedom means. It means altering the locus of self-consciousness. I feel the desire to eat, and say I am hungry. While eating, I desire—so I think—to eat too much; and then a second, inner, consciousness—conscience—protests. I may obey the protest or not. I am tired, but after a cup of coffee, I, as mind refreshed, would like to luxuriate in a volume of philosophy, or study Chinese or the Fourth Dimension. Then comes a call to help someone, or a duty arises, and *my conscience* forces *me-reluctant* to yield and put down my world-triangulating Hegel. Is it not clear where we have the center of self-feeling?

Progress consists in displacing it. After that is done we do not say, I want to gluttonize while *my conscience* protests; but, I want a clear soul though *my body* wants to gluttonize. I have *become* conscience. And so I feel a victim, perhaps a sorrowful and ashamed one, when I have permitted my body to win. I now want to help my fellowmen or do my duty when my body wants to sit in an arm chair or my intellect to wrestle with the Fourth dimension or Chinese; or, it may even be, I want to study Hegel in the attempt to get

MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

some light about the universe, while my—something lower—wants to read a novel. I want to attune my consciousness to the highest while my body wants to tumble like a log into bed. I, in fact, am now inclined to assert *my* nature against all those desires, physical, sentimental-emotional, and mental, that want severally and by turns, to assert *theirs*.

But I am victim, not from actual weakness, but from habit; partly from the habit, taught by the churches, of thinking myself a worm, that is, a compound of all these from which I now begin to free myself and in so doing demonstrate non-identity. I am victim from having so long identified myself with them, or let them into solution in me, that I cannot at once clearly disentangle in consciousness, or cannot maintain the clear consciousness of the achieved disentanglement at the time when that maintenance is most necessary.

However, practice makes perfect. Little by little, day by day, and especially night by night, I make the dissection with effort and realize my proper nature. The fight begins. For the dissected-off energies are conscious and intelligent and object to my freedom as meaning their subordination, though that subordination is necessary for even *their* health and perfecting. And for me, not until I have achieved the task and victory of recognizing myself and holding the recognition all the day without waver does the real human life begin. We do not know what that is.

This path of life would be as selfish, as no-whither-leading, as blind, as any other, and as bad for the multitude that the few should follow it, were it not that the root of every human nature, once reached, its center light or keynote, is compassion. To attempt to get at the actual facts of being, to realize self, to rise, by any other path than through that, is again to be the victim—it may be of a very subtle master, but a master. The feeling of compassion, kept like a gold flame in the heart, is the key and the path. There is no attainment of freedom except that way. Any other

is trodden under the yoke of some master desire, however subtle, however much disguised by the philosophies that tempt us to become "superman." Everyman's consciousness has in it somewhere a special light whose rays we need for our growth. But we can only open the door to let them in by opening it to let our own out, and such open-

ing is obviously to be done by cultivation of the feeling of compassion virilized by corresponding action. The same opening lets in the rays of the Great Light from whence we derive, the source and sustainer of all the glories and beauties that man has ever heard, seen, or imagined—a Light made by the churches into a Man of some sort and labeled God!

Whilst we are slave, unsuspecting, to even the subtlest of the masters, to that one which is even the unconscious desire to be a superman or to surpass others in something—the servitude to that one may in quick time become also servitude to any other, even the basest. He who begins this path towards freedom must never stop—will never want to, though one or more of the masters will want him to and want him to think that it is he who wants to. Day by day he must proceed toward his shining goal and the height of freedom, making compassion the light and test of all his efforts—the test. Is this effort I am now making, compatible with the now made light of compassion? If not, make some other which is. The effort begins in thought, and deepens to sustained aspiration. Compassion is the feeling corresponding to the *fact* of human unity, of human co-derivation from the Great Light. At the "end," which begins real life, each man whilst a self, and self-conscious, will share the consciousness of every other, that is, stand fully in the light of every other; and, more than all, in that higher Light which holds the unthinkable reason of things, their purpose. As Katherine Tingley has said:

Man's only way to win his great hope and to know the truth is to seize hold on himself, assert and realize his potentially all-dominating soul-existence. Making his mind and memory register beyond all cavil or doubt what he then knows to be true, holding himself at his true dignity, guiding into right conduct all the elements of his nature, his body, mind, and emotions, he will maintain from that moment strength and joy in life. That once done, could he but stand in that attitude for a few weeks or months, he would have made of his mind a willing instrument of service, harnessed it to the chariot of the soul and dissolved away its limitations. C.

Katherine Tingley at Isis Theater

A VAST audience filled every seat of Isis Theater last Sunday evening to hear Katherine Tingley speak. Long before the doors were open the spacious entrance was blocked with people, many of whom came as early as 6.30 in order to secure seats although the meeting was not advertised to begin until 8.15. The doors were opened at 7.25 and in 15 minutes with the exception of a few reserved seats, the Theater was filled from floor to ceiling while hundreds were turned away.

The audience was a thoroughly representative one, not only of San Diego's best people, but of almost every section of the United States, there being at the present time many visitors in the City and every hotel being crowded with guests, from New England and the Eastern States, from the Northern, Southern and Central States, from Canada, and several from Europe.

It was plain to see that the majority of those present were not there out of curiosity but because they felt a genuine desire to hear what Katherine Tingley might say, and the sincere and earnest attention that they paid to her words were not only an evidence of her power as a speaker, but also a witness to the need of a true philosophy of life which Theosophy can supply. Most interesting was it to watch the faces of the audience, and to see or rather feel them catch their breath when Mrs. Tingley paused for a moment. Not once did their interest flag, as they followed every word. One could hardly believe that Mrs. Tingley had spoken for nearly an hour, and yet there was philosophy enough for a whole lifetime. Not a philosophy of mere words but a message from the heart, a message as it were from the very soul to the hearts and souls of her hearers. A message of hope, an appeal to the soul, a challenge to each one to live up to his highest ideals, to call upon his own divine nature, to declare that he was a soul and recognized his responsibilities as such.

It would be impossible in a brief report to give any abstract of Mrs. Tingley's talk, yet one feels that the pictures she presented to her hearers and the appeal she made to them would stay with many of them to the end of their days. An altogether new light was thrown upon the teachings of Karma and Reincarnation and the meaning of what so many regard as some of the sufferings of life; how in the light of Reincarnation and the justice of the Higher Law they are in reality blessings and opportunities. What is needed in the world, said Mrs. Tingley, is a moral revival. Time is too precious to call the people together to remind them of their sins. Have you not them with you all the time? . . . Men want to think more, to live more, to be more godlike, and then salvation will come.

But this does not represent a tithe of what was said. It seemed as though the whole gamut of life was run through, and in the response that came from the hearts of many in that great audience, there seemed to be the baptism of a new effort, a higher resolve.

But however brief this report, it would not be just to omit mention of the music. The playing of the opening selection *L'Ouverture Solennelle* (1812), Tchaikowsky, by the Râja Yoga Orchestra—pupils of the Râja Yoga Academy—was a remarkable performance and elicited most hearty applause. OBSERVER

Nerves and Selfishness

SPEAKING of a certain "music cure," in vogue at Boston, a newspaper comments on the tragedy of all the movements and cures in which "a seemingly worn-out nation is seeking for help"; and says that that tragedy lies in the fact that the cure tends to aggravate the disease. For, just as people who have been advised to "relax" will proceed to relax furiously, so these music curists will doubtless take their music by the pailful and be thinking all the time, "Is it doing me good?" The paper continues that the great ailment of the times is "nerves," but that the so-called cures, instead of dispersing the attention, merely concentrate worse than before. But no real remedy is prescribed; for our authority, in recommending the moderate use of everything, exercise, hygiene, optimism, etc., adds but little to the prescriptions of the faddists and does not touch the root of the matter.

What, then, is the root of the matter? Theosophy, the doctrine of common sense, says—*selfishness*. This is a hard word to use, some may think; but nevertheless it is true, if the word "selfishness" is to be given its full significance. Selfishness lurks in a variety of guises, behind which its existence is not always suspected. The crude easily recognizable form is greediness, piggishness; one does not accuse all the nervous invalids of that. But our culture is deeply ingrained with hypocrisy—often of the unconscious kind; and by this people have learned to disguise their selfishness without by any means killing it out. The process is often so subtle and undertaken in such good faith that its existence is not suspected. Thus there may be many persons who seem both to their friends and themselves to be amiable and excellent, and who doubtless are actually so in most respects, but who pamper themselves in some way or other. Chronic valetudinarianism may be a form of selfishness. "Nerves" is almost always traceable to selfishness. We may call nerves a form of selfishness, or selfishness a form of nerves, but both are due to the same cause—too much consciousness of self. Vanity and self-consciousness take ridiculous forms and are a source of much needless pain to the patient. In an assembly he imagines that the eyes and thoughts of everyone are turned upon himself—a most absurd conclusion, especially in view of the fact that many of them are probably laboring under a similar delusion with respect to themselves. Sometimes other people are sources of irritation to the "nervous" individual, by the noises they make or some other thing they do which annoys him. What is this but a form of selfishness? Many forms of nervousness are simply due to physical debility, and are non-existent when the patient is well; and this physical debility may be caused by self-indulgence or an enervating mode of life. Here again selfishness is at the root. Often the effect is so far removed from the cause that the connexion is not seen; and thus an invalid may claim compassion for what is really, if the truth were known, the outcome of his own selfishness. For the seeds sown in the mind spring up in aftertime into physical ailments.

And now what is to be thought of those so-called cures which prescribe as a remedy an

even greater measure of self-contemplation—the "psychic" and "new thought" cures, whose method seems to consist in a concentration of all the attention on the "I"? This is indeed an attempt to turn out Satan by means of Satan. If ever such methods do succeed in banishing for a time some of the minor symptoms of nervous selfishness, it is only by causing them to become absorbed into a still greater selfishness. And this greater selfishness will cause more pain than ever to the patient and be very hard to get rid of. For these so-called teachings invoke every power of the soul in the cause of egotism and turn even Deity itself into a great "I." The poor unfortunate wight who is troubled with an over-burden of self-consciousness is advised to intensify and exalt and subliminate his sense of "I." Verily, nervous diseases will follow in the wake of such teachings.

The only way to cure nervous selfishness or selfish nervousness is to get the surplus consciousness out of the little personal center in which we have fixed it and to let it expand into a larger sphere. For this it is necessary to have larger interests.

"But how are we to get larger interests?" some may ask; and here again human frailty will speak in the voice of impatience. You cannot get out of the tangle all at once; it is of many years' making, and will take time to undo. But you can begin. Relax the mind—from what? From thoughts of self. When annoyed by the innocent doings of others, remember that it is your own weakness that is at fault, and learn to look at things from their point of view. Sacrifice a few pet foibles and hobbies; get out of your groove. And take the good old advice to seek out someone who is worse than yourself and help him.

As to philosophy of life, study Theosophy; for its teachings make for commonsense, for strength and health. It does not teach you to worry about the fate of your soul, nor does it tell you that you are only a higher animal. It teaches that the true center of life is not the personality, and that to find the real Self one must abandon care for the false self. The everlasting search for personal comfort is what causes much of the nervous disease of today; it is a fruitless quest, for personal comfort is not the goal of man. Man is at peace only when he has temporarily forgotten himself, and dissatisfaction returns as soon as he again becomes conscious of himself. To live in a continual forgetfulness of self would be continual bliss; and those most nearly achieve it who work for others; they do not have ailments, or do not know that they have—which amounts to about the same.

Probably the best way to treat a patient suffering from nervous selfishness would be to ignore his complaints, refuse to consider his disease, and divert his attention in some way to an all-absorbing occupation. Merciful "destiny" often does this for people, and by its so-called misfortunes gives them something

"Winter Scene in Sweden"

THE engraving published on this page last week, over the above caption, should have been credited to the photographic art, and courtesy, of *Stenders Förlag*, Stockholm, Sweden, by whose permission the photograph was reproduced in this Review.

to think about besides themselves, and makes them really happier.

But the most important thing to do is to strip off the disguises from these high-named diseases and states and recognize them for what they are; for then we shall be in a fair way to overcome them, whereas otherwise we might be apt to cherish them under the impression they were virtues. How many are trying to get rid of their old-man-of-the-sea and yet hugging him all the time? By giving to the complaint some high-sounding name, we secure attention and sympathy for it, and make it the subject of a great deal of discussion and many treatments; whereas were it known that it may be just ordinary selfishness in disguise, it might be suffered to pine from inattention. Thievery has been dignified into kleptomania; the breaking of the seventh commandment, into affinities and twin-souls; common nerves into hyperaesthesia and neurasthenia; and so on.

But it is only Theosophy that can afford the broad and lofty ideals for which civilization craves and show it the path to a life that is above the miserable aims that end with self.

STUDENT

Vimāna-Vidyā

WE speak of the Golden Age, of Antiquity, of the dark ages, of the renaissance. Some scientists talk of the "primitive age" as an actuality without being able to explain just what that may mean. It is quite useless to explain that when our "Iron Age" is forgotten and its marvels disintegrate back into nature, the stone weapons of the savage of today will yet remain a witness to our "primitive age" of the year 1909, there and thereabouts. Not a vestige of a railroad or a steamship or a skyscraper or an iron bridge will stand beside the Carib stone axe or the Highland quern or even the flint of a Moorish rifle to show that we ever rose above the status of "stone age" men. Not a book of ours (let us hope) will survive the palm leaf scripts of ancient India, and there is nothing even now to rival the pyramids of Egypt and of Cholula. Perhaps the most frequent relic of twentieth century civilization will be in the shape of steins and beer jugs, and there is not much likelihood of our successors imagining us to be a race of gods living on nectar sipped therefrom, unless archaeology stands very still in its methods and deductions.

Looking backward instead of forward, how are we to assert that even our material progress is not analogous to the swift recapitulations of the ante-natal human development, in which the vehicle of the future man passes through the stone, plant, and animal stages in a few short months instead of millions of years? How are we to assert that in the throes of a new cosmic birth we are not merely rushing through old stores of knowledge by right of having slowly acquired them ages ago and put them by, as mental deposits in the cosmic mind, like universal memories?

Our vanity prompts us to suppose that we are the greatest race of thinkers that ever burdened the skin of this old earth, but perhaps our best thoughts are merely memories, and we shall one day have a realization that we have not even begun to think yet.

The conquest of the air is the latest stronghold of nature and of science that we have

dared to attack, and so new is the subject that it is scarcely more than the flapping of a bird's wing in the nest.

And yet the science of "flying in air-vehicles" is one of the oldest inheritances of the Aryan race, from the great scientists of Atlantis, many, many thousands of years ago. In the east there are records of such a science under its Sanskrit name of "Vimāna-Vidyā," *air-ship science*. There are records of the use of such vehicles in escaping from the cataclysmic destruction of the last great island of Atlantis when it went down beneath the waters in a single day and night. Mr. Judge chose more than one vehicle for his teachings, and one, not the least effective, perhaps, was the short story claiming no authenticity and no mission, but appealing to the deeper sense of the fitness of things. And he gives us a wonderful account of a battle in mid-air between two cars, one light and swift and the other heavy and powerful. The story is so vivid that it seems as though written by an eye-witness. But whatever its purpose and place, the story stands as a reminder that even in the nineteenth century the existence of such a wonderful ancient faculty was known, as does also *The Secret Doctrine* of H. P. Blavatsky. And when in future years it shall be found that these records *do* exist in the east, they will provide one more link in the chain of proof that there is a knowledge that never dies out in the world, a knowledge far more important to humanity than flying machines, a knowledge that awaits but altruism to become available for humanity's use.

It is worthy of note that the "fortuitous conclusions" of Chaldaean astronomers who made such remarkably correct "guesses" at things which we take pride in as the glorious achievements of latter-day perfection, are stated to have purposes which we do not dream of today. And in this connexion we learn that the arts of Meteorography and Meteorology were highly developed as a natural concomitant of Vimāna-Vidyā. Probably we have not touched the edges of what they knew in Atlantis twenty thousand years ago, as regards these subjects.

P. A. M.

Visions of Heaven

SOMEBODY will have to make an anthology of heaven-poems one day, poems which express the poet's attempt to look beyond the veil and follow the path of a departed friend or of some epic hero. Tennyson, for example, looked after Hallam; Milton after "Lycidas"; Shelley after Keats; and Tennyson again after Sir Galahad.

Perhaps these stand in order of their inspiration, in the order of their reality of symbolized vision. The heaven they want to express, since it is *state*, not place or form, must have picture-symbols for its setting.

Tennyson hardly knew what to do in the first case. He was profoundly a mystic when he came elsewhere to deal with Sir Galahad; that was his proper inner being; but his outer consciousness dwelt in nineteenth century England where his work lay. And it was with *that* eye he looked after his friend; not until he got away from his century did his inspiration come upon him. The "Saints" that Milton saw have hardly become more credible as "great Intelligences":

The great Intelligences fair
That range above our mortal state,
In circle round the blessed gate,
Received and gave him welcome there; . . .

A tolerably obvious and orthodox heaven, seen perhaps through memories of Dante, made as it were to order, uninspired, no true raptured sight.

Something of the vision was certainly upon Milton, but in his theological setting he can hardly give us today very much of it. The pictures are grown pale and even mildewed. Still:

There entertain him all the Saints above
In solemn troops, and sweet societies,
That sing, and singing in their glory move
And wipe the tears forever from his eyes.

Shelley was almost carried beyond the power of words:

The breath whose might I have invoked in song
Descends on me; my spirit's bark is driven
Far from the shore, far from the trembling throng
Whose sails were never to the tempest given;
I am born darkly, fearfully, afar;
Whilst burning through the inmost veil of Heaven,
The soul of Adonais, like a star,
Beacons from the abode where the Eternal are.

Heaven is veiled; the star of Adonais shines through it; the "great Intelligences" of Tennyson, and Milton's "Saints," are etherealized and intensified into the "Eternal" Ones.

The "veil" which hung between Heaven and Shelley's eyes, became, for Sir Percivale, far distance beyond a great Sea. He saw Sir Galahad

. . . far on the great Sea,
In silver-shining armor starry-clear;
And o'er his head the Holy vessel hung
Clothed in white samite or a luminous cloud.
And when the heavens opened and blazed again
Roaring, I saw him like a silver star. . .
Then in a moment when they blazed again
Opening, I saw the least of little stars
Down on the waste, and straight beyond the star
I saw the spiritual city and all her spires
And gateways in a glory like one pearl. . .
Strike from the sea; and from the star there shot
A rose-red sparkle to the city, and there
Dwelt, and I knew it was the Holy Grail. . .

The poet of the *Bhagavad Gītā* attempts no symbolism, stopping short, almost content with pregnant negations:

But — higher, deeper, innermost — abides
Another Life, not like the life of sense,
Escaping sight, unchanging. This endures
When all created things have passed away:
This is that Life named the Unmanifest,
The Infinite! the All! the Uttermost.

After the death of man or a universe, between that and their new activity in new form, comes *state*, rest, purely subjective bliss; and the pictures must all be symbols. *It is*, even while the man "lives"; *it is the man*, afterwards. Rest, perhaps, from one viewpoint; perhaps the only real life and activity from another, the transcendental. STUDENT

Waves of Sun-Force

IN the *Scientific American* the fact is mentioned that on September 29 there was a remarkable auroral display and magnetic disturbance in the north of the United States, while the greatest change in comet Morehouse took place the following night. Assuming an eleven hour interval between solar disturbance and terrestrial response, the comet being 2.7 times more distant from the sun, it would respond to the same influence after thirty hours, which is closely what occurred. J.

Art Music Literature and the Drama

Old Records Brought to Light

AN author, delving into old state papers, has discovered what he believes to be the first English printed book that contains any reference to America. It is entitled *The Ship of Fools*, was first published at Basle in 1494 under the title of *Das Narrenschiff*, translated into Latin in 1497 and thence into English by one Alexander Barclay in 1509.

The book was a satire upon the social vices of the day in which all classes were depicted, each with its special weaknesses held up to ridicule. Among others were those "fools" who presumed to lay claim to a knowledge of the laws of geometry and of the earth's surface, and the passage which, it is believed, referred to America runs as follows:

For nowe of late hath large londe
and grounde
Ben founde by maryners and crafty
gouernours
The whiche londes were neuer
knownen nor founde
Byfore our tyme by our prede-
cessours
Parchaunce mo be founde wherein
men dwell
Of whome we neuer before this
same harde tell
Ferdynandus that late was kynge
of spayne
Of londe and people hath founde
plenty and store
Of whome the bydyng to vs was
vncertayne
No christen man of them harde
tell before
Thus is it foly to tende vnto the
lore
And unsure science of vayne geo-
metry
Syns none can knowe all the
worlde perfyte.

The author who translated this work into English was a poet of some note in his day and a teacher at the college of St. Mary Ottery in Devonshire.

There is another and better known English work, in the shape of a dramatic poem, the date and authorship of which is unknown, in which most interesting reference is made to the New World. Its title reads:

A New Interlude and a Mery of the Nature of the iiij elements, Declarynge many proper Poynts of Philosophy Naturall and of dyvers straunge Effects and Causes.

The following extract is from the dialog, being the words of one "Experyence," who represents a navigator and recites them pointing to a map. It more particularly refers to the voyage of 1517 under Cabot, in which the crews mutinied:

There lyeth Iselonde where men do fyshe,
But beyonde that so colde it is
No man may there abyde.

¶ This See is called the great Oceyan
So great it is that never man
Coude tell it sithe the world began
Tyll nowe within this xx. yere
Westwarde be founde new landes
That we neuer harde tell of before this
By wrytynge nor other meanys.
Yet many nowe haue ben there

¶ And that contrey is so large of rome
Muche lenger than all cristendome
Without fable or gyle:
For dyuers maryners haue it tryed
And sayled streyght by the coste syde

Yf that they that be englyshe men
Myght haue ben the furst of all
That there shulde haue take possessyon
And made furst buyldynge and habytacion,
A memory perpetuall
And also what an honorable thyng
Bothe to the realme and to the kynge
To haue had this domynyon extendynge
There into so farre a grounde
Whiche the noble kynge of late memory
The most wyse prynce, the vij He[n]ry
Causyd furst for to be founde . . .

These works have an interest both to the historian and to the student of letters. The first work appeared in English just before the dawning of that day heralded by Luther, Melanchthon, and Erasmus, almost contemporaneous with Sir Thomas More's *Utopia*, after Columbus had completed his fourth voyage, and but a few years before Copernicus wrote his work *De Orbium Coelestium Revolutionibus*.

After these, records, histories, and books of travel relating to America were not infrequent. These, however, deserve not to be obscured if only for the glimpses they give us into human nature. H.

Mr. and Mrs. Wm. Shakespeare
at Point Loma

THE eminent English musician, Mr. William Shakespeare, recently visited Point Loma and the Theosophical Headquarters there, and among other things, he and his wife were entertained by Katherine Tingley at a reception given in the Râja Yoga Academy, on the Headquarters grounds. The eminent vocalist after listening to a few words of welcome spoken by one of the Râja Yoga pupils, Iverson Harris, Jr., representing the Isis League of Music and Drama, expressed himself in a very neat response from which the following is extracted:

STUDENT

The atmosphere which the genius of Mrs. Tingley has made us breathe here seems to inspire me with a little more courage than usual to say a few words. I thank you very sincerely for your reception tonight, and the eloquence of the young gentleman who has just said such beautiful words causes me to appreciate your welcome more than ever.

I have heard a great deal about this remarkable institution, and I am not surprised to have enjoyed so much the musical performances this evening. It is with a strange delight that one recognizes the simple and earnest joy of these young people, who seem to have dived deeply into the spirit of the music which they interpreted so admirably; I have greatly enjoyed the playing of those beautiful compositions, and my dear wife and I thank you most sincerely.

WOOD INLAY WORK, FLORENCE
Tarsia degli Armadi (1460)

About v. thousand myle

¶ But what commodityes be within
No man can tell nor well imagin
But yet not longe a go
Some men of this contrey went
By the kynges noble consent
It for to serche to that entent
And coude not be brought therto
¶ But they that were the ventere[r]s
Haue cause to curse their maryners
Fals of promys, and dissemblers,
That falsly them betrayed
Whiche wold take no paine to saile farther
Than their owne lyst and pleasure
Wherefore that vyage and dyuers other
Such kaytyffes haue destroyed
¶ O what thyng a had be than

"Upward and Onward"

"UPWARD and onward for evermore." Such was the suggestion for a motto by H. P. Blavatsky, the great Theosophical Teacher, to her students. Could one have a better? Bears it not with it the aroma of continuous effort, the joy of endless achievement, and the ideal of increasing perfection?

And what does all this mean? Does it not whisper with the rhythmic sweetness of the boundless ocean, lapping its crested waves on the sea shore, or the melodies unspeakable of the wind-swept trees? "The Divinity of Man. The Divinity of Humanity." Aye, such is the burden of the song of truth, the life-giving truth of the ages—Theosophy. Such is the chorus of emancipated man, the song of the Saviors: "Ye are Gods. Ye are Gods." Shall we not listen?

"Upward and onward for evermore." Even to think of such a possibility is strengthening; but how much more so to take an active step in the direction of achievement. To make one stand for what is right, true, and noble, is to lift oneself to a higher level of perception than we ever experienced heretofore, and to send the forces that make "for the healing of the nations" outward through a new channel.

Oh that we realized more the mighty power that lies in making a choice for the right in the little choosings that are daily with us! Humanity has been enough discouraged, from the "you naughty boy," "you naughty girl," of mismanaged infancy, to the "miserable sinner" aspect of current conventional religious thought for the unfortunate adult. Where would the world be without Theosophy, one wonders who studies its priceless wisdom, its helpful, hopeful teachings of self-effort and purification. Think of the great crusade for Universal Brotherhood that Katherine Tingley and some of her students made around the World in 1896-7 with the purple banner, "Truth, Light, and Liberation for discouraged Humanity" emblazoned in gold upon it! Since then we have been witness to the higher

WASHINGTON

From the "Commemoration Ode."

WHEN dreaming kings, at odds with swift-paced time,
Would strike that banner down,
A nobler knight than ever writ or rhyme
With fame's bright wreath did crown
Through armed hosts bore it till it floated high
Beyond the clouds, a light that cannot die!
Ah, hero of our younger race!
Great builder of a temple new!
Ruler, who sought no lordly place!
Warrior, who sheathed the sword he drew!
Lover of men, who saw afar
A world unmarred by want or war,
Who knew the path, and yet forbore
To tread, till all men should implore,
Who saw the light, and led the way
Where the gray world might greet the day,
Father and leader, prophet sure,
Whose will in vast works shall endure,
How shall we praise him on this day of days,
Great son of fame, who has no need of praise?
How shall we praise him? Open wide the doors
Of the fair temple whose broad base he laid.
Through its white halls a shadowy cavalcade
Of heroes moves o'er unresounding floors—
Men whose brawned arms upraised these columns high,
And reared the towers that vanish in the sky,—
The strong who, having wrought, can never die.

Harriet Monroe (Selected)

grade of perfection that can be obtained through making Theosophy a living power in life, in the wonderful institutions at Point Loma, where the divinity of man is recognized and the children are the "buds of promise" of a new and higher race. The picture that is presented of Theosophy there and elsewhere, where the Rāja Yoga Schools are established, is one of glorious hope for all humanity, for let us not forget that divinity is not the property of one or two, but of all men, and may become the supreme factor and guiding power in their lives when the conditions prevail that enable it to be so.

The first good level is Right Doctrine. Have we not now Theosophy as taught —

by precept and example, mark you — by H. P. Blavatsky, William Q. Judge, and Katherine Tingley? The first fruits of the results of their labors are before our eyes and "he who runs may read." So let those who are in earnest take heart, "for your deliverance has come," says the Teacher.

"Upward and onward for evermore," will be humanity's motto from now on, because the leaven from the center is penetrating the whole lump. There is a center formed of Universal Brotherhood today, and slowly but surely the heart of the world is responding to the beat of the Central Heart, in love for fellow men; and so one may say, in the light of Theosophy, that though clouds may flit across the surface, beyond, the Sun is shining, and we are taking our first step in that march that leadeth to the goal.

STUDENT

Woman's Power

THAT the present time is the "Woman's age," is an idea which receives wide acceptance, but how many even vaguely realize what a tremendous debt of gratitude the world owes to two women in particular? Here and there down through history women have made themselves felt actively in the world's affairs, as witness Hypatia, Joan of Arc, Queen Isabella, and Queen Elizabeth, for example.

As a woman, one asks, "Why should there not be great women? Is it not as possible for a noble, heroic, and wise Soul to dwell in the woman's form, as in the man's? And even in mentally running over the list of friends and acquaintances, one finds noble and ignoble, clever and stupid, persons of both sexes, about equally divided. Women's virtues, generally speaking, do not come so much before the eye of the world, and therefore much true heroism lies unrecorded. Is it not true, nevertheless, that almost all *great men* have recorded their gratitude to mothers, or sisters, and wives, for inestimable help, both through wise teaching in formation of character, and active sustain-

ing encouragement and co-operation in their work?

It is very true that the majority of women do not even dream of the power they possess, let alone claim and use it. And Theosophy teaches us why, and Theosophy was brought to us in this age by a woman who *did* understand. It is being demonstrated as a practical power by another who also understands. I am speaking, of course, about Madame H. P. Blavatsky, and of Katherine Tingley. They came to teach both men and women of their divine power, to help them to make it operative and so redeem the race. Did they exalt men over women, or women over men? Nay; you will find no faddism in Theosophy. Both sexes are treated from the standpoint of Soul, for behind the fleshly vehicle of man or woman may stand the purified Soul, which is sexless: Spirit, not matter.

Does it not appeal to reason and common sense that woman has a particular niche to fill in the universal scheme? Consider the place she occupies, the almost supreme control over the life of infant humanity and the training of little children, not only as mothers but as teachers! why, the destiny of the world lies in her hands, and its progress has been retarded by her apathy and indifference towards those factors that make for true progress. That things are as they are cannot of course be laid solely to the account of women, and noble are the pioneers among them who have blazed the tracks through the forests to the open country beyond, in sight of the boundless ocean of freedom, freedom of *thought*, freedom of *heart*! For it is through the Heart that woman will wield her power, the great Mother-heart that will do and dare all for the sake of humanity.

Woman, as she comes to understand herself, will use the great pristine force of impersonal, unselfish, universal Love for the redemption of the race. Extending the "home" idea the world's children will be her children and the aid she renders to those who claim her immediate protection and care will be acts of loving service "for all that lives." Women cannot grasp the possibilities of their power fully without the aid of Theosophy, for that alone teaches them to understand themselves and their destiny and gives the strength to fulfil it. To build a harmonious structure we need a plan and design that is in proportion and correct relation to its surroundings. This Theosophy gives, placing the keys of Unity, the Divinity of Man, Karma, and Reincarnation, in our hands with which to surmount the difficulties.

Yes! We may leave the past behind us now. Women are facing the dawn at last, pioneered and guided to the true Light and Life with all its possibilities of noble service, especially to the young. EMILY I. WILLANS

The Crime of Wastefulness

TO misuse, to abuse, to use carelessly and wastefully the gifts so lavishly bestowed upon men, is a crime against nature, and one which is always dearly paid for. It indicates a lack of a sense of responsibility; an indifference to the needs of others; a clumsiness of nature; a lack of nicety and fineness. It seems to correspond to something on the moral plane, which is like vulgarity on the mental.

We, as Americans, are said to be wasteful, and the merit of this reputation has been most forcibly brought to light lately in the appalling statistics in the recent report of the "Conservation Commission."

It seems that there is enough *daily waste* of natural gas to supply every city in the United States having a population over 100,000; that 50,000 acres of forests are burned over yearly; that one fourth of the

gifts which is the mark of a true gentleman or gentlewoman.

The Râja Yoga training instils this idea into the young natures which come under its care, and has had occasion to observe very often how wofully the mothers have failed to do their part. STUDENT

Memory-Flashes

NOW and then with sudden prominence there flash out memory-pictures of days that have been dear to us, and we are filled with tender longings for their return, and regrets that they need ever have passed. Life was very lovely back there in childhood when we were but awakening to life, only dimly conscious of it; there were sweet and eager tiptoe days in youth when simple responsibilities came bashfully to meet us; there were glorious hours of high purpose — they were dreams, of course — but were they not really glorious to us with their promise of help to the world? We were young, and our untried strength was apparently so unconquerable!

Well, shall we someday hence look back with a similar longing for the return of these times of strength-trying? of these wasted hours of loosening manifold snares into which we stumble repeatedly? of these maddening hours of scrambling out of pitfalls, interminably? Perhaps — but no! Surely we learn as we go on. Surely these memory-pictures are of a true time, when we were a little nearer soul-life, our real happiness. Surely the heart is longing only for the return of its bright days and the conditions that gave them brightness.

It is the brightness *that we were* then, at our best.

Painted in tones our dull eyes may understand, these are pictures of our very selves, not indeed as were we a little while ago, but of the life that was anciently ours in an exalted time. We are longing and praying not for the return of a fleeting moment of joy out of this or any others merely personal experience, but with all our souls, for getting back to our God-like living, the true child-state so long lost, and sometimes so nearly let go but for our memory-pictures; the soul's way of saying: "Go on, for the goal is also the starting-point!" W. D.

Brickeen Bridge, Killarney

BENEATH the darkly wooded mountain, Torc, lies the loveliest spot in all Killarney, Muckross Lake and Dinish island. Torc, a word of weird Atlantean might! When one has come by boat amid the wild and fairy-haunted beauties mirrored through the Upper Lake, and shot the waterfall, and passed below the rustic bridge at Dinish, the strange and peaceful beauty here is like some rare enchantment. Beyond the Brickeen Bridge is seen the Purple Mountain. J.

BRICKEEN BRIDGE, KILLARNEY

standing lumber is wasted in cutting and logging, and that from one to two thirds of that which reaches the mills is wasted!!

These are simply a few of the facts to which they have called attention. Think of the waste in directions which did not come under their field of observation, and then think of the waste going on everywhere every second, of which no statistics could ever take account. For this carelessness observed in magnitude means that the units which make up the nation are abusing with their every breath the nation's resources, squandering the nation's fortune.

The President stands aghast, and asks what can be done. And no wonder. It is a problem for any statesman to face. Laws can be made which will no doubt help. But nothing will touch the evil in a real way which does not touch the individuals. They make up the nation. The fineness and niceness of true economy should be a part of the education of the young. It is far more important than another subject added to the list of studies. Mothers should train themselves and their offspring to use everything well and properly. They should teach them that there is a dignity in the careful and wise use of nature's

OUR YOUNG FOLK

The Windmills of Holland

HOLLAND'S windmills are essential for the commercial welfare of her country as well as for the help they give in keeping the water from getting too high in the dikes. A large sized mill, when the wind blows reasonably hard, will pump out of the canals one thousand gallons of water a minute. This is very necessary in order to keep the land from being inundated, and it takes one thousand windmills constantly pumping to keep the water down. Think of a country which is kept from being a large sheet of water simply by building dikes and keeping great windmills pumping the water back into the sea.

Besides pumping water, the mills supply power for grinding corn, pulverizing rock, manufacturing paper, and sawing wood.

The picture represents a street in Rotterdam, the great commercial center where the imports from the Dutch East India Company lie along the great quays in the shape of barrels of sugar and molasses, bags of coffee, etc.

In spite of the constant struggle to keep the country from the ravages of the sea, Holland is one of the most enterprising countries of its size, and always to the front in promoting peace between the nations. EUGENIA

The Poet of the Piano

THE remarkable genius which the great tone-poet Frederic Chopin had as a composer of piano music, is shown by the wonderful popularity which his works have steadily enjoyed for nearly a century. The cycle of a hundred years has rolled around since the birth of this gifted son of Poland on March 1st, 1809, and today one practically never attends a piano recital where his works are not on the program.

Some of the world's great musicians produced compositions in many different forms and for a variety of instruments, while others showed a marked tendency to follow some special line of work for which they felt a particular aptitude. Bach displayed the versatility of his genius in his manifold master-works for organ, clavier, violin, voice, etc., none of which have ever been surpassed as perfect types of their kind. Beethoven although composing glorious music for various instruments, best expressed his superb creative powers in orchestral forms. Wagner, Gluck and others wrote operas almost exclusively, while Chopin wisely limited his exquisite tonal art to the one instrument which he understood best. He possessed a unique mastery of the pianoforte and was rarely gifted in bringing out its rich

A STREET IN ROTTERDAM

A DUTCH LULLABY

FAR over the water so blue and deep
The little Dutch babies are going to sleep;
Bright yellow tulips are nodding their heads
And fluffy young ducks are safe in their beds,
While slowly the windmills go whirling around—
Go whirling around—go whirling around.

Far over the water the sails are furled
And the stars peep out on a sleepy world;
The moo cows moo softly beneath the trees
And the white sheep drowse in the evening breeze,
While slowly the windmills go whirling around—
Go whirling around—go whirling around.

Far over the water comes down the night,
Fading and fading the silvery light,
While storks on their nests stand white and tall
And over the tree-tops the shadows fall.
While softly the windmills go whirling around—
Go whirling around—go whirling around.

Elia Broes van Heckeren in *Good Housekeeping*

beauties and varied resources. His style was entirely original, and he enlarged the scope of the piano by introducing many novelties of technique and artistic expression which had hitherto been unknown.

As a lad Chopin was fortunate in having good home surroundings and refined influences. His imaginative faculties and musical aspirations were fostered and encouraged by his parents and friends, some of the latter being people of the highest distinction. His teacher in composition at once recognized the boy's genius and wisely allowed him from the first to follow his own natural, poetic, bent. Unfortunately all teachers are not so flexible and liberal minded, for some fetter their pupils by keeping them in some traditional mold.

Thus Chopin's striking individuality was early developed; and he was fortunate too, in receiving a good general education, being a graduate of the Lyceum at Warsaw.

He traveled much and lived for some years in Paris, where he was courted by princes, ambassadors, etc. Through his close associations with the aristocracy he acquired polished manners, though he was sometimes rude to inferiors which shows that his refinement was not thorough. Chopin was modest about his attainments however, for when great musicians came to him for lessons and expressed their esteem for his genius, he wrote, "Really, if I were somewhat more silly than I am, I might imagine myself a finished artist; nevertheless I feel daily how much I have still to learn."

This famous composer was patriotic and generous in helping his countrymen and had other good traits of character; yet he also had many personal

limitations and his life cannot be held up as an example of purity or strength.

He put his best self into his music, which portrays the sadness and aspirations of his own life as well as those of his country. His genius enabled him to write compositions in the smaller forms, which are perfect gems of their kind, breathing forth the delicacy and fragrance of flowers. They abound in delicious harmonies and haunting melodies composed in his charming, inimitable fashion, and also express dramatic, grand, and even heroic qualities. Although his music is loved by musicians and the general public alike, yet it lacks the depth and nobility, the spiritual and uplifting power which the creations of Bach, Beethoven, and some other great masters possess.

The number of Frederic Chopin's works includes nearly two hundred compositions, all of which are for the piano with the exception of a few songs.

A RÂJA YOGA MUSIC TEACHER

I CALL that man idle who might be better employed.—*Socrates*

WHEN others speak all manner of evil things against thee, return not evil for evil, but rather reflect that thou wast not more faithful in the discharge of thy duties.—*Ogawa*

How few are clearly, vividly impressed with the great truth that each, in his own sphere, should live for mankind, as Christ did, for the redemption, instruction, and exaltation of the race, and that the power to do this, in his proper place, abides equally with the humblest and the highest.—*Horace Greely*

THE CHILDREN'S HOUR

The Difference

ALL night long a storm had raged; but at the break of day, the clouds cleared away and the sun shone out warm and bright. Down in the potato patch the green vines lifted their stems and fairly seemed to shout for joy, so fresh and clean did they feel. From out the damp earth crawled many little pink earth-worms to enjoy the sunshine, for it felt rather cold in the dark ground. Besides they probably knew they could choose no better time for a holiday, for little earth-worms lead very busy lives. They were very quiet and inoffensive, being naturally meek, and just lay on the ground not interfering with anyone.

Now on the potato vines there were many, many roundish, reddish-looking insects, who proudly considered themselves very industrious, and quite superior creatures to such humble things as earth-worms. To be sure, they were eating away busily enough; but there are different ways of being busy.

When these little crawlers saw so many little worms emerging from the earth and stretching their pink necks up in the air as they drank in the freshness of the morning, they gave vent to many exclamations of disgust.

"Ugh! just look," cried one, "at those horrid creatures! If I were so ugly, I should stay in the ground where I belonged."

"They certainly should be taught to keep their places and not come thrusting themselves on our sight," cried another.

"What is the use of such creatures, anyhow?" cried a third. "Why, they haven't the sign of a wing or a leg, and though they are not bad at crawling, I am sure they are lazy and useless. See how slowly they move!"

The poor little earth-worms heard all these unkind remarks and felt like crawling back into the earth again; when a big, black beetle, who had been listening quietly, cried out indignantly, "For shame! you useless creatures, to say such unkind things about these little worms. Are they not attending to their own affairs? Why cannot they enjoy the sunshine as well as the rest of us? They certainly deserve it. If it were not for them, it is my opinion, you would not fare so well."

"Just listen to that!" cried one of the little crawlers. "Beetle talks as if we were indebted to these worms; and besides, he calls us useless, when who could work harder than we do?"

"Work! Humph!" said the beetle sarcastically, "destroy, you mean. If you would go down in the earth, as I do, and see these little worms plowing and harrowing the hard soil, until it is loose and soft, making it pervious to the rain, and giving the roots and seeds a

JANSJE AND MORIETJE GOUD

Lotus Buds of Utrecht, Holland

A DAISY SONG

OH! the daisy, the milk-white daisy,
The wisdom that doth lie,
In that tranquil, golden eye,
Puts you and me to shame,
Tho' our learning has brought fame,
So modest, yet so wise, the milk-white daisy.

The spring sun shines! the milk-white daisy
Raises her pure head, from her cosy winter bed,
Looks out in pure amaze, yet trust is in her gaze,
And she lifts her face to Heav'n, the milk-white daisy.

She is content, the milk-white daisy
To live her simple life, apart from worldly strife,
Rejoicing if she brings one little thought that sings,
Into a lonely heart, the milk-white daisy.

Gertrude Falton

better opportunity to grow — these potatoes, for instance, upon which you feed so sumptuously" — the black beetle liked to use big words — "then I think your opinion of your own importance, as compared with the earth-worms', would be somewhat lessened."

Having uttered his opinion, the beetle seized hold of a straw and began pulling it into the

ground; for that is one of the duties of the beetle, you know, to help to keep the ground soft by pulling in leaves and sticks; the little worms, having had air enough, crawled back to their work; and the potato bugs?

The farmer came along that day and seeing the destruction wrought on his potato vines, sprinkled them all over with some very green-looking water, which made the little crawlers so sick, that they — well from that time the vines flourished, and the farmer had a fine crop of potatoes.

C. H.

Why the Coyote Howls

A LONG time ago when the world was new and people had just begun to live upon it, the animals were very useful to the gods who were busy making things comfortable for the people; but they could not always be trusted.

One day the gods gave the coyote a bag which he was to carry south, and he was told not to open the bag until he should come to a certain place. So he took the bag and started, and for many days traveled onward. He became very hungry and could find nothing to eat. By and by he began to wonder if there was not something to eat in the bag. At last he could endure it no longer; so he untied the bag and found that it was only full of stars which immediately flew up into the sky. You can see them there now if you look at night.

The gods were very angry at the coyote for letting the stars out of the bag, and for punishment they ordered that the coyote should wander over the earth for ever after with the tooth-ache, to remind him of his disobedience; and if you happen to hear him howling out on the hills at night, you may know that he is having a bad spell of the tooth-ache. KELIANIMA

Lotus Children

DOTTED here and there all over the globe are groups of little boys and girls in whose hearts a tiny flame is burning. As they grow, the flame grows, for it is fed by the great truths which they are being taught and by their own efforts to be pure and helpful. These little workers learn to know each others' faces in the CENTURY PATH. They are the Lotus Children of the world. Their lives stretch out before them — long years in which to learn and help. And it is a happy thought to them that in these years to come they may greet many of their comrades and work side by side with them in Lotus Mother's great work for Humanity. One reason why these little boys and girls can be so joyous is that the wisdom they are learning helps them to see the unity of life. This sight strengthens their hearts for noble effort.

THE MYSTERIES OF THE HEART DOCTRINE

Prepared by
KATHERINE TINGLEY
AND HER PUPILS

*The Theosophical
book of the
Twentieth century*

Tells the story and the history of the
Theosophical Movement.

The prices are \$2 in cloth and \$1.00 in
paper, which barely cover the cost, for it is
printed and bound, not gaudily, but with
such carefulness and thoroughness of art
and craft as to make it unique among
modern edition books.

**SOME OF THE ERRORS OF CHRISTIAN
SCIENCE
CRITICISM**

by **H. P. Blavatsky and William Q. Judge**

CONTENTS:

"The Empty Vessel Makes the Greatest Sound"
A Note of Warning

—by **H. P. Blavatsky**

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by **William Q. Judge**

A MOST VALUABLE PAMPHLET. Outside of Theosophy
there is given no adequate explanation of the healing
that is at times accomplished, nor of its rationale,
nor of the ultimate price that must be paid and the
dangers connected with such practices.

This pamphlet is invaluable to all students.

Mysticism, True and False

THIS is one of the most misrepresented of all words, and has been made to do service for all manner of queer and ill-savored fictions. From time to time honest men cry out upon it, deceived by this confusion; then it becomes time to explain. Now for instance, we find a very patriotic Celt in the *Nationalist* of Cardiff, Wales, quarreling with the application of such a term to the Celtic race; he confounds mysticism with decadence, and makes it anathema.

Heaven help the decadent! Heaven help the man whose mind is in a vague dream-world on which the sun never shines, and wherein is no wholesomeness! There are many of them in the world in these days of morphine and cocaine; but let not their vaporings be confounded with mysticism. The two are farther apart than the poles, and the whole range of life lies between them.

Mystics there were in ancient days, and they made the world ring with their deeds. For this is to see creation in a light brighter than the sun's; all created things glimmering with their divinity, and all events in their true and startling significance. There is an old story whose hero was adventuring in the domain of

The Interpreter of the Divinity of Life

Gwenhwydwy the enchantress. His insight was pitted against her illusions, and the result would be, either that the Island of the Mighty should be freed of her power, or else that "her spells should be set upon him, and he in the form of a stone beneath the wide sea." Of all her treasures he was to have one gift from her: if he accepted any but the one right thing, she had triumphed; if the right choice were made, the victory was his.

Whatever rich gift she might offer him, says the story, he would look well at it, and by reason of the clear soul and vision of him—were it a peerless sword, some old straw or stick of driftwood would darken up for a moment through its semblance; were it a shield studded over with gold of Arabia and adorned with patterns of blue enamel, he would see through its splendor the likeness of a worthless toadstool; the brightest diamond would become a clod beneath his gaze; her magic disguised nothing.

The Wonder of the World

Now this is a picture of the real mysticism. "Things are not what they seem," indeed they are not; we live in a world of wonders, and miracles are not noticed, they are so common. For the mystic there is no drab nor commonplace; above all things, he is never bored. All life is the pilgrimage and adventure of the human soul; we go from

strength to strength through infinite ages; we prove our merit on the obstructions of the world. The true spirit of youth is redolent of mysticism, because you will not find "impossible" in the mystic's dictionary. Does not the soul stand above matter; is not man the soul, inseparable, in the higher reaches of his being, from Omnipotence?

The man in the street sees things in a very dull light. Life is all hedged in by material and personal considerations; little Ego has grown unwieldy, and shuts out the view of big Cosmos. Mediocrity is the one ideal; for all the trumpery personal ideals march towards no goal but mediocrity. Would to Heaven men could realize this; then

"For Among You is a Greater Thing" the eternal promise of the world would not be so eternally blighted. We may run after ambition of the personal kind, but where are we to arrive? What does it amount to, this making a big name and place for *yourself*? Men have done it these thousands of years, and the world is still (among other things) an abode of misery and vice. Our civilization is still trimmed round with slums and squalor; we have still the perpetual menace of war, still the thousands going down into ruin and waste, still invincible mediocrity swells and struts. Personal aims, as you may say, may be made use of now and again; twisted, so to speak, to diviner and universal ends; but of all the things men care to fathom, which is the one that will shake mankind out of its lethargy, and fill the world with MEN and WOMEN, sons and daughters of the gods?

Faith; that is the thing; it is faith that we need. Not faith in the correctness of things as they are, and a leaving to Providence what one should be doing oneself; but certainty of our own power to right wrongs and to do men's service in the world. Milk for babes by all means, and the softened wind for the shorn lamb; but are we never to grow up men? Are we never to stand in the strength of our souls? The mystic's rallying cry is the Soul of man; and that word means to him: valor, rapidity, to mend the cracks and botches of our modern life; to be exultantly brave, as it is our unspoiled nature to be. "In our proper motion we ascend; descent and fall to us is adverse." Thus the mystic.

The sword whose gashes "no physician could ever heal"—to the mystic that is a reality, more real than your cavalry weapon of the day which shall break or rust in time, and is without supreme distinction. For this grand weapon is the symbol of the Divine will

Our Power to do Service in the World

The sword whose gashes "no physician could ever heal"—to the mystic that is a reality, more real than your cavalry weapon of the day which shall break or rust in time, and is without supreme distinction. For this grand weapon is the symbol of the Divine will

latent in man, which man may acquire and use against all the forces of his lower nature. The mystic calls upon a power of invincible compassion within himself; and when he begins to do, thrones crash and tumble, humanity either quakes or sings, but —
Sons and moves forward. Only a man
Daughters of with this vision of internal
The Gods splendor can really move things and do the most exalted service. Was Joan of Arc a decadent? She was a mystic; for which reason the church burned her; by the mystic power she was enabled to free France. She let no grass grow beneath her feet; her vision was intense and clarified action; if she had lived out the proper term of her life, much of the evil in Europe would have been hunted from the world before now.

The mystic sees all things in a white blaze of reality; worlds and worlds are open to him, shedding their clear illumination on this external world of our own. For him there is a splendid potentiality aglow, even through the dull complacency and debasement of man. He is little blinded by the illusion of personality; since it is true that, if our inward eyes were clearer, we should perceive no division of human interests, but that the fate of humanity is one. *I can make sixty years or so of un-*

To the Mystic, the *profitable renown and riches*
Fate of *for myself, he says, but my*
Humanity is One *life is not set within these*
limits. I can make my name
familiar to the peoples, he
says; or I can so live in secret that their lives
shall be less bitter. I can gain the soft places
and comfort for the worse, or flaming exultant
consciousness of the better being of my-
self, he says; I can live totally for and in the
life of humankind. Life cannot be chopped
into fragments. That which is the self of
ourselves runs and quivers through creation's
veins; it is more ancient than the world and
more lasting than the sun.

He who is devoid of mysticism stops at the appearances of things, and is unconcerned to question their reality. So events flow by and remain dumb for him. They spur him only moderately into action, they proclaim no message of reality; he may not or will not inquire into the meaning of the world. But the mystic is one who meets events expectant, and drags the whole value and secret from them; perceives their unobvious reality, and compels them to unusual universal service. He has the key of
The Key to
the Meaning of
the World

other worlds, without which this one remains barren and without interpretation. Man is a soul for him, not limited, but with boundless splendid possibilities. All events, as he sees them, are the stepping-stones of evolution; according to the use they are put to shall they lead to usefulness (the word is too tame, a million times), or to decay. Life is a quest, the most magnificent of all adventures, profoundly significant in every part; an unending quest until humanity be without stain or sorrow. Inaction remains impossible; the soul is out against all the forces of animal-human nature; and he is the knight-errant of the soul. The universe is lit up with the "light that never was on land or sea"; it is magical, sentient, companionable; of incredible beauty, aglow with the perfection of all poems.

"Where there is no vision the people perish"; they grow fat and sheeplike and mediocre, or else rancorous, uneasy, full of gall; wealth and pleasure are their gods whom they follow; and from the rule of these it takes sorrow to redeem them.

**A Faith in
the Soul of
the Race**

In many races, and certainly among the Celts, there comes an echo of ancient mysticism down the ages. If that people has not perished, it is precisely because they held fast somehow, obstinately, wrong-headedly, if you like, in defiance of all conditions and circumstances, to some gleam or other of a vision, which perhaps made them great in unfathomed antiquity. (It has not yet come into fashion, but it *has* to come into fashion, to believe that greatness does stand far away behind us all.) Arthur would come again; Owen Glyndwr would come again; somehow, somehow, by God knows what improbable means, the soul of the race would again bear bloom and fruitage, and lighten the world. Life is indestructible, and the grandeur that has been shall be again: the mystic is indomitably certain of this; and the Celts believed it, *y Gwir yn erbyn y Byd — the Truth against the World* — and have survived. That they have survived

**Y Gwir
yn erbyn
y Byd**

only with such loss, and so subordinately, is precisely because their vision had grown all crooked, as you may say, and was held obscurely and

out of relation to life; personality, self-seeking, jealousy and passion had crept in. All racial greatness springs up out of men and the souls of men; that a race believes in it is proof that at least its possibility remains locked up within that race, and may return. It concerns no nation to hold that it is better than others; but unless it desires death, let it vehemently believe, let it flagrantly, exultantly, courageously believe that it, too, has divine possibilities, that it may become a power of huge usefulness in the world. Let it cling to its vision, let it flaunt its vision in the sky; let it live strenuously towards that, and subdue all things ignoble in its life.

Y Gwir yn erbyn y Byd:—and that truth were nothing to live for, were it only a material and dull thing, a matter of how to get money, and the comforts of the personal life. Let the Celt remember his heirloom of mysticism, and make it a sane, balanced quality; let him make it a living power in the life of the world today.

**In the Vision of
Greatness the
People Lives**

The world has infinite need of it. Patriotism is mere selfishness, a farce, and a brutal farce, where it plays only for its own hand. If this race or that is to have any future, it must be because it can supply some spiritual need of the world. This not in a dogmatic sense; dogma is worn out, and has redeemed no promises. What the races have to do, is to find each its own higher Self. No fear of monotony then, and no fear of jealous contention. There would be no white light, without the seven prismatic rays; and we cannot imagine yellow or indigo ashamed of its nature, nor thanking God that it is saved from the errors of violet, or not as that poor orange or green. True patriotism has little in common with the blatant swagger that has usurped the name. KENNETH V. MORRIS

Measuring Emotions by Electricity

IN the *Scientific American Supplement* is an article on this subject, translated from *Umschau*. It explains that the emotions are measured by the "psychogalvanic reflex" — a change in the electrical properties of the skin.

The point of a needle, connected with one pole of a sal-ammoniac battery, is thrust through the skin of the palm of the hand; and a steel plate, connected with the other pole, is laid on the skin near the needle. In the circuit is a sensitive mirror-galvanometer which indicates the strength of the current that is passing. If the feelings of the subject continue quiescent, the strength of the current gradually diminishes, proving that the resistance of the skin increases. But when the subject feels an emotion, the resistance of the skin becomes suddenly and markedly lessened, as indicated by the galvanometer.

The experiment may also be performed by dipping each hand in a basin of lukewarm brine connected with the circuit, or pressing the hands on metal plates. Further, indications can be gotten without having a battery in the circuit, and in this case they are attributed to an electromotive force in the skin, likewise variable under emotion.

The manner of exciting the emotions in the subject experimented on was to startle him, or else to mention some word that had an emotional significance for him. Experiments were also made on animals and proved successful.

It has been suggested that the effects are due to involuntary movements on the part of the subject, whereby the closeness of contact between the skin and the terminals is varied, thus varying the resistance; but this explanation will not do because the experiment is equally successful when tried with the other forms of apparatus mentioned. There is also another reason against it. The effect lags behind the emotion, often as much as six seconds — too long an interval for an involuntary start. This last fact indicates that the effect produced in the skin is a comparatively remote consequence of the emotion. In connexion with this may be considered the fact that the experiment will not come off if a nerve has been severed in the part experimented on; but that if there is insensibility of that part from some cause other than physiological, as in the case of some hysterical patients who lose sensibility in parts of the body, then the experiment does come off. These facts seem to show that the change in the skin is a physical one. From the fact that the experiment succeeds best with the palms and the soles, it was inferred that the greater abundance of sweat glands in these parts might be accountable; and it is found that the reflex can be almost destroyed by the local application of belladonna which dries up the secretions of those glands, but that it is little affected by stopping the circulation of the blood or deadening the nerves.

The discoverer states that his discovery has been made several times before, but always disregarded as being outside the confines of orthodox science; and he heralds the favor with which it is now received as a sign of the changed views of science — which may yet learn that the body is the vehicle of electromagnetic forces in the inner eidolon. T.

Some Views on XXth Century Problems

Revivalism

REVIVALISM cannot, of course, be prohibited by law; that would perhaps, from some points of view, be undesirable; a lesson may be learned by a proportion of those who go through it. Those who do not, but are inclined to approve it, might however reflect that after fifty years of it society is but what it is. Boston is now witnessing and encouraging a great outburst of it. The central figure employs one hundred evangelists and pastors as his lieutenants. When it is over, a world-wide campaign is to be undertaken, the itinerary to include Australia, China, Japan, Korea and Europe.

Anyone who thinks carefully will see why this business not only *does* work out at best uselessly and otherwise perhaps disastrously, but *must*.

Revivalism is essentially the arousing of emotion, its theory confusing emotion with spiritual feeling and holding that emotion can finally be made to yield knowledge. The primary emotion is fear, based on the sense of sin; the statement is then offered and accepted that Jesus can take away that sin. Fear then disappears in a relief so keen as to amount to joy, the second emotion. The victim of these emotions is made to regard himself as sinner, now saved from himself and from the consequences of his past doings. Clearly there is no place in this method for self-respect. Is there any method of religious awakening that has such a place?

Suppose a man who might otherwise go to one of these displays, to sit down at night when all is quiet and begin to think into himself. He reviews his ordinary conduct, especially that part of it which will be called sinful at the displays. He perceives himself to be wishing that he had acted, and could act, otherwise; imagines himself as doing so, and feels the pleasure of having resisted. The next day he carries out a little of his imagined program; that is, feels the desire to do something unworthy come in upon him, but holds to the self of the night before.

Suppose he goes on doing that night by night and day by day, and at last realizes that the desire to do unworthy things and think unworthy and selfish thoughts is not himself but comes in upon himself from some non-self part of his total nature.

Then he questions: What am I? since I find that the more closely home to myself I get, the less do I want to sin and the more power I have to resist. What can it be but something divine which, as soon as it comes home to itself, loves purity, unselfishness, compassion; loathes their opposites; and exhibits the latent power to control and dissipate these opposites?

Then in one of the quiet hours of his thought, alone or at home with himself, desires all silenced for the time, he finds that he can pass as it were beyond himself into a great presence of the same nature, can commune in feeling with that, can gain greater strength from the moment and a deeper peace.

He has found himself and has begun to

find the reality of the source of himself. Further search will bring deeper knowledge, as to which, however, words will not apply. It includes knowledge of the inner purpose of life, of human nature, of immortality, of the power that sustains the living world, and of the inner unity of men; it includes the awakening of a universal love for mankind and a desire to serve and guide them where he has reached.

All that can be done by any man for himself. And then he will fully understand the injury that is done to mind and even body by the fevered, emotion-wrung, humiliating, fear-evoking cowardice-based revival service.

The "Ascent of Man"

SIR Ray Lankester, contributing some popular scientific (anthropological) papers to an English contemporary, must be unconsciously biasing his readers *against* the current doctrine of the ascent of man. He takes them back through European geological time, through the iron, bronze, and then into the stone age; first into the more recent or Neolithic part of it; then into the older or Palaeolithic part. In point of civilization the line of temporal regress should be sinking continuously towards completer and completer barbarism.

And it does — for a while.

The Neolithic men belong by comparison to our own days. They were, even 7000 years ago, only a little rougher in their tools than were the peasants of the remoter parts of Europe a few hundred years ago. They had not even as much tendency to or gift for artistic work as the ploughman of our own days, and they left none behind them.

Now go back further and art appears! The Palaeolithic men

have a wonderful artistic skill in carving and drawing on bone and ivory, and on stone and on the walls of their caves, the animals that surround them and are hunted by them.

They decorate their carvings with spirals, lozenges, and circles cut in low relief. But their truly astonishing skill and mental development is shown in their carving and engravings of animals and fish, which are executed either on bones or stones, or on pieces of the ivory of the mammoth. Besides the reindeer, horses, goats, saiga antelope, rhinoceros, mammoth and seal, their carvings include statuettes and drawings of men and women. At the best period some of these carvings show a mastery of the material, a directness and a simplicity and beauty of essential line, together with true observation of characteristic form, which separate these works from those of the ordinary savage of modern times, and have caused living artists of authority to declare that these craftsmen had those definite gifts which entitle them to be recognized as brother artists — an assurance which confirms my own impression based on a long study of large series of the actual specimens. The best works of their later period (for their skill took time to develop, and follows the laws of growth of all art) represent animals, such as deer, in movement and often turning round or foreshortened; some of their carvings of horses' heads are worthy of the Parthenon.

Where did these artists come from? No one knows, says Sir Ray Lankester, nor where they went.

There are no indications of their having come from the east, nor from the south. Why

not the west? Indeed *must* they not have come from the west, and must there not have been a continent westward to come from, in fact, Atlantis? Since Atlantis is not now there, it must have sunk; and so one naturally asks whether that sinking may not have been the force impelling them to flow over on to Europe?

Then where did they go? Why assume that they went anywhere; may they not have been exterminated by the Neolithic men, who *did* come from the east? Sir Ray Lankester places the beginnings of the Neolithic age as near as 7000 years ago. According to Theosophy it was very much further back. The Neolithic wave rolled from Central Asia, to be later followed by the first of the waves we may call truly Aryan. Palaeolithic man was an Atlantean remain, a degenerate from Atlantean submerged civilization; Neolithic man a precursor of Aryan. According to Theosophy neither of them erected — as science asserts that the Neolithic man did — "the great stone avenues, circles and cromlechs . . . and the solitary big stones called 'menhirs.'" These, including Stonehenge, were erected by men from the south, for a purpose which science has not yet fully guessed. STUDENT

The Prayer Gun

SOME of the more prominent vivisectors in England are getting a new view of religion. It reaches them in the form of a circular, telling them that the senders purpose to pray for their immediate death unless they stop their practices.

They are evidently devout persons, or they would hardly have so unquestioned a faith in the (even if murderous) efficacy of prayer; they are as evidently foolish, or they would not think that the work of the universe can be morally furthered by killing.

Why do not these people remember something in the New Testament about a sparrow falling to the ground? Karmic Law does not overlook the animals, and the prolonged suffering at the hands of the vivisector is recompensed in more than one way. Like man, the animal reincarnates; though, unlike man, there is little or no interval between death and rebirth. The suffering has turned up the light of its consciousness; it is nearer its ultimate goal, the human stage; and its capacity for the enjoyment of life is greater for the stimulant of prolonged pain. Of the vivisector, the Law will take charge after his death, when, in the clear light which for him will produce only the long agony of remorse, he sees how he outraged the protective relationship designed between man and animal. This Law, hardly visible in the Greek Nemesis, provides that those who are cold to suffering must suffer and suffer until in every fiber of their being they know what it is, until they are softened to the uttermost compassion — the *suffering-with*. "Vengeance is mine," saith the — Law; and it knows its business. Man may *prevent* evil; he ought to do so; but he may not *punish* in the sense of allotting the amount of retributive pain he thinks desirable, still less punish with death. STUDENT

Archaeology Palaeontology Ethnology

Ancient Andean Empire

THE *National Geographic Magazine* for September, 1908, contains an article on the Andean Highlands, by Harriet Chalmers Adams, with beautiful illustrations of the scenery and of some of the Cyclopean pre-Incasic architecture. The sight of these lofty sunlit plains, with their huge carved stones standing out against the skyline amid their arid surroundings, cannot fail to give the imaginative beholder a glimpse of ancient Egypt in America; there is the same feeling of vastness, openness, sunlight, and eternal duration leading back through the ages of history to a time when the earth held civilizations greater than any she has witnessed since. We feel that by comparison with these ancient "Sun"-worshippers we must have been engaged ever since in worshipping the moon or some minor planet; and indeed, the last stages of the decay of their descendants are marked by the setting up, in place of the symbol of Light and Wisdom, of the four-armed Cross-without-a-circle, whose worship has been attended by so much gloom and strife. It is not sufficiently realized that in the New World we have the relics of a civilization at least as grand as that of Egypt, and perhaps even more ancient; and archaeologists show a singularly disproportionate interest in the caves and scrap-heaps of barbarian tribes that have wandered over the land in comparatively recent times.

The importance of such a realization is that it connects us with a past which is surely more inspiring for our future than would be the connexion with these wandering savages. And we are in fact connected; for, though the race, as a race, may have almost vanished, it is not so with the Souls that tenanted it; they have passed on. And this reflection may help us to get rid of that modern fetish, that dogma of modern science, that our only heredity is from the direction of the lower kingdoms. For this fetish broods like a hideous nightmare over the modern imagination, paralyzing hope and endeavor with its fearsome clutch at our vitals. If we could but look it straight in the face, it might melt away and let through the light of full wakefulness.

Tiahuanaco is an Indian hamlet on that bleak upland plain of Bolivia which the traveler crosses to reach La Paz; it is 12,000 feet above the sea, and from it rises the lofty Cordillera. Eastward from Lake Titicaca, in a wind-swept barren country, flourished a

Lomaland Photo. and Engraving Dept.

THE "KINGS' BATH," BATH, ENGLAND—DATING FROM 1236 A. D.

mighty ancient civilization. In Tiahuanaco beautifully cut stones from the near-by ruins form part of a church built by the early Spaniards, just as their religion is formed from odd fragments of ancient teachings and rites. The ruins themselves lie on a level part of the plain and consist of rows of stones, sections of foundations, carved doorways, portions of stairways, and vast masses of rock partially hewn. No mortar was used, yet they were so skilfully fitted that the foundations have outlived the centuries. They are of red sandstone, slate-colored trachyte, and dark basalt, transported from quarries many miles away. The most remarkable monument is a monolithic gateway, which was standing three years ago but has since fallen. A doorway $4\frac{1}{2}$ feet high and $2\frac{1}{2}$ wide was cut out of a great block of stone over 7 feet high, 13 wide and $1\frac{1}{2}$ thick. Above the doorway are four rows of carving and a central figure in high relief. It is claimed by students of antiquity that no better piece of stone-cutting exists. The figures have human bodies, hands and feet, but are winged, and some have the heads of condors; others, with human heads, wear crowns and carry scepters. All these smaller figures seem to be kneeling in worship of the large central figure, which is crowned and sceptered and decorated with the heads of condors and tigers. Says the writer:

As I gazed on this quaint doorway, unique on this continent, a picture came to me of the metropolis which it once graced. The massive wall of

which it formed a part rose before me, a wall surrounding a populous city contemporaneous with the ancient capitals of Egypt and the East. I did not feel as confident of our triumphant modern civilization as I stood in the shadow of this hoary gateway. "History repeats itself," the thought came to me; "civilizations rise and fall." Which of the mighty edifices now standing in America will testify to our nation's greatness in the centuries to come?

We must not forget that stupendous engineering work, the ancient highway which connected Cuzco with Quito and which still remains in part. It was built of rough stones set into the ground, and bordered by low stone walls, through which drains were cut at intervals. Also there are the terraces which the ancient inhabitants cut for agriculture on the mountains, 1000 feet high, and irrigated by canals commencing at the snows. The fortress of Ollantaytambo was erected on a spur of mountain, and its outer walls zigzag up the hillside, while on the summit are the remains of cyclopean walls, beautifully hewn doorways, niched corridors, and great slabs of porphyry supporting a terrace. Six of these giant slabs still stand, and half-way up the mountain are others weighing many tons. The people who lived here made terraces, aqueducts, and all sorts of great engineering works, carried vast stones up the mountains and straightened rivers. They must have been a great people; and we can hardly credit them with so much ability in these matters and yet deny them equal ability in the other elements of a well proportioned culture. STUDENT

* The Trend of Twentieth Century Science *

The Physiology of Earthquakes

IT would seem likely that we shall not get very far towards an understanding of earthquakes until we measure something else than their movements. What is it that animals feel, often many hours before instruments register any tremor? Hardly an earthquake occurs unheralded by curious animal behavior; and this not only of animals in contact with the ground, sheep, horses, poultry, dogs and so on—but of birds. There are probably electro-magnetic disturbances in progress long before the shock, and it is quite possible that animals are more sensitive than we to such changes. Before the St. Thomas earthquake of last year, in the Danish West Indies, strong magnetic earth-currents were noted on the submarine cables, beginning a few hours in advance and ceasing almost immediately after the shock. If, as M. Moreux, director of the Bourges Observatory, now maintains, earthquakes have a solar cause and have an eleven year cycle corresponding with the sun's, magneto-electric concomitant changes *must* occur.

Why should not our bodies be as sensitive as the animals? If we are the highest among them, we ought to lack nothing that they possess. Doubtless we have a good deal more sensitivity than we know, could we but get our minds out of the way. Woodmen often know the exact time of day; their orientation; the coming of storms and rainfalls; and after all, those who live in earthquake districts do recognize what they call the "earthquake feeling" in the air, often hours before the event.

Our knowledge of the earth's physiology and anatomy seems to be advancing, though as it were by negation merely of old opinion, and very tentative hypothesis. The connexion of earthquakes and volcanoes is doubted, even known in many cases not to exist. One ceases to hear so much about the shrinkage of a hot nucleus, necessitated by the nebular theory, as the cause of earthquakes; and new causes, such as the wandering of the poles, the solar spots, the weight of accumulated ice masses at the poles, are taking its place.

The earth's shape is not what it was. It was an orange; it is a lemon; most recently it is a pear, among the fruits. But M. Moreux deserts them altogether and decides upon a pyramid, apparently a double one with the two bases applied.

STUDENT

Geographical Experiments

NATURE seems very undecided what to do about the Bogoslov Islands. Behring Strait, marking the old connexion between Alaska and Siberia, she will at present leave a strait. Alaska's long Aleutian arm, made now of islands, running towards the southern tip of Kamchatka, she seems to be in two minds about.

Captain Munger, in the *Geographical Magazine*, describes the many experiments going on around the Bogoslov nucleus of the Aleutians.

We first know of the nucleus as a volcano, discovered by a Russian admiral and now known as Castle Island. About a hundred

years later, in 1886, a new island appeared more than two miles away from it, at once named Fire Island. Doings seemed to have ceased for twenty years, but at the end of that time Fire Island added to itself a piece named Perry Peak. In another year Perry Peak extended itself by means of McCulloch Peak, 500 feet high, to effect a junction with Castle Island, making one land of the lot. But McCulloch Peak presently thought better of it and went under. Perry Peak followed, thus leaving a considerable gap. That was not long permitted, and a ridge of land now again connects Fire Island and Castle Island.

This region is one of the upper tips of the horseshoe Lemuria, a continent which went under from volcanic disturbance, leaving innumerable peaks, some very unstable, as witnesses. The Bogoslov disturbances may be a mere far-away echo of a process once conducted on a gigantic scale; or they may indicate nature's purpose to do a little more reformation.

Some of the peaks, for example Easter Island, still present traces of ancient Lemurian work and civilization, notwithstanding the immense lapse of time and even one or more submergences.

STUDENT

Mineral Ferments

THE president of the New York State Medical Society urges us to take a more respectful view of air, water, and minerals, to class them as actual foods. If to his list we add sunshine, we have all that the plants need—most of them, at any rate. So a case is made out.

Keeping to minerals, he thinks that a study of their role would throw an important light upon the causation of many diseases. A Russian physiologist, writing lately upon the same subject, has suggested that the salts play the part rather of ferments than of food; that they preside over, and control, assimilation rather than strictly enter into it. Yet they have this mark of the food proper, that when taken in organic union with cell matter whether animal or vegetable, they leave the body in stabler form than they entered it. They do not exist in the cell as naked phosphates, sulphates, chlorides and carbonates; but that is mainly the form in which they leave with their work done. The question is not settled whether, if administered in that final form, they can be assimilated into living cells and so be properly labeled foods. They do work of some kind in that form, and that constitutes their title to valuable place in medicine; but is that work a true feeding?

M. D.

Dew-Ponds

THE mystery of dew-ponds continues to be somewhat a mystery, and will be one until some careful scientific experiments are made. There are several modes of constructing them, varying around this one: A layer of straw over the bottom of a pit; on this a layer of clay; and on this a layer of stones. The clay settles down about the straw, and in its lower thickness becomes one mass with it. In a few days dew has collected;

this goes on adding to itself; and finally there is a pond which is more or less permanent. In all the variant methods the straw is the common element. And since it would be taken into the clay, lapse of time would hardly convert it into ordinary soil continuous with that which lies below it.

Here then is a heat insulator, preventing the earth beneath from getting as warm by day as that which is not so covered. At night, according to the ordinary theory of dew formation, the earth radiates its heat, finally chills the air below the point at which it can hold its dew, and a deposit follows. The dew-pond floor, colder already, effects an earlier and more copious precipitation, active even when the surrounding soil may not be cold enough to precipitate any.

So goes the ordinary theory. But it is said that there will occasionally be two ponds of identical construction by modern makers, close together, of which one will work and the other not. Again, the sun will take up an *ordinary* amount of dew in a few minutes; it seems strange that the straw should remain in function for so many centuries, and that it should so very markedly differentiate a dew-pond from a simple clay or concrete lined pit; and one would think that in any case the soil beneath the pond would by conduction soon be nearly assimilated in temperature to that around it. So the difficulties of theory are considerable.

STUDENT

The Color Cures

COLOR cure appears to have become orthodox. The State of Illinois has erected two large cottages furnished with eight solariums for the prosecution of this method of treatment. The colors are ruby, amber, violet, and opal, the walls harmonizing with the lamps. Excitable patients take doses of the violet room; despondent ones of the red room; the opal light has been found antiseptic, and beneficial to consumptives. As each cottage will accommodate 150 patients, a large addition to knowledge should result.

But it ought to be remembered that this treatment, promising and attractive as it is, the first chapter perhaps of a new and cleanly medicine, opening all sorts of doors to a physiology so far absolutely unexplored—was arant quackery and superstition a very few years ago, as much so as is still the use of the magnet recommended centuries ago by Paracelsus. He, we believe, also advocated the use of color. Science changes, but she does not seem to learn much modesty. A writer in the *Forum* laments that we really do not know what we may believe. The nebular hypothesis, the doctrine of mass, "theories of inheritance, of chemical affinity, of disease, of health, of life, of death," and a thousand others, "all come and go so rapidly that we can scarcely keep pace with the procession."

The moral is to refuse to a theory the respect due only to facts; to refuse to dismiss a well-reported fact from our consideration on the ground that it is stigmatized as impossible, or that to consider it is superstition, or that it contradicts some existing theory. C.

Studies

Light is Cold Radiance

AN observer at Lowe Observatory, Echo Mountain, California, writing in the *English Mechanic*, says:

All matter in existence is by no means condensed into suns, planets, and moons. There is the stellar floor to be explained. What of colossal areas of coagulated, shining, glimmering matter? On the darkest mountain nights up here on this summit, just after protracted rains, when nearly all dust is cleared out of the air, the shimmering banks, heaps, and walls round about the visible universe are always seen. There are several hundred dark places in which the 16 in. telescope here cannot reveal light; but all other areas in the celestial vault send out faint pearl-colored light. In some places it appears to be solid and continuous, while in others the impression asserts itself that the floor is granular.

He calls this primordial matter, the mass of Nature, and speculates about "cold light." Light, he thinks, is entirely electric and corpuscular, and nothing exists but electricity—electrons. Matter is not matter until the electron attaches itself; then it becomes living.

There is much said by H. P. Blavatsky in *The Secret Doctrine* on these subjects, which cannot adequately be condensed here; but its general purport is to counteract the theories and conclusions of modern physics (often made, consciously or unconsciously, to harmonize with materialistic and unspiritual views of life), and to present (as far as practicable) the actual facts, which harmonize with the sublime ethics and luminous science of Theosophy. And one thing she says is that light is not a mere product of energy and physical matter; that kind of light is but a gross manifestation of real light; the intense heating of matter affords conditions for the manifestation of light, but is not its cause. And now science has virtually come over to the view that light can exist without heat, that it is in its origin disconnected from heat, and that its association with heat is purely incidental. Science has lately adopted with practical unanimity the notion that physical matter is a mere resultant of energies that work and live in some finer substratum; though they are foolishly endeavoring to formulate that substratum in the same terms as have already proved inadequate in the case of physical matter. This is what Theosophy has always contended for; that the forces that work in the physical matter are ulterior to it, prior to it; that what physicists call forces are the manifestation in the physical world of ultra-physical powers. Electricity is what this writer has resolved the universe into; and this

Lomaland Photo. and Engraving Dept.

OLD TREE IN THE ENVIRONS OF SIENA
The Castello di Belcoro is in the Distance

electricity cannot be either force or matter as known to the physicists, since it has been predicated for the very purpose of acting as a progenitor to both of them. In cosmic space is cold radiance and electricity, and the worlds are this cosmic substance gathered into nuclei.

TO SCIENCE

SCIENCE! true daughter of Old Time thou art!
Who alterest all things with thy peering eyes.
Why preyest thou thus upon the poet's heart,
Vulture, whose wings are dull realities?
How should he love thee? or how deem thee wise,
Who wouldst not leave him in his wandering
To seek for treasure in the jeweled skies,
Albeit he soared with an undaunted wing?
Hast thou not dragged Diana from her car?
And driven the Hamadryad from the wood
To seek a shelter in some happier star?
Hast thou not torn the Naiad from her flood,
The Elfin from the green grass, and from me
The summer dream beneath the tamarind tree?
Edgar Allan Poe

In the same way, the essential Life of Man is a universal substratum, a cosmic radiance; and his personality a condensation or nucleus of the same. Our personal self is a mere image on a screen. Our body is a speck of dust that has caught the etheric radiance, in which it dances awhile with borrowed sheen. The

only goal worthy of Man is so to live that he may be conscious of this universal Life pulsating through him, and become a Spiritual Power radiating Light and Harmony, instead of a speck of cosmic dust. Here is where the true facts of Science harmonize with the true facts concerning our life and its duties and defeat the aims of materialism and selfishness.

STUDENT

Rockless Wastefulness

THE first Conservation Commission report says the high-grade iron ores and the petroleum in the United States, may not last beyond the middle of this century; and the coal, not beyond the middle of the next. The daily waste of natural gas would supply every city in the States of more than a hundred thousand population. The forests diminish at a rate three and a half times the yearly growth. Fifty million acres are burned over yearly. Only 32 per cent of timber felled appears in market as lumber. From the forests we take 260 cubic feet per capita per annum, while Germany takes 37, and France 25. Present tax laws prevent reforestation of cut-over land and the perpetuation of existing forests by use. What part has science played in the production of these results, and will the advance of science be of itself sufficient to render them impossible?

Path

ON A GRAY DAY

THE earth seems old to-day,
And cold and gray,
Yet here and there I note a trace
As of some smiling, patriarchal face
That, looking backward o'er the days
Of autumn past sees summer's haze,
And hears again the bird notes in the vale,
Full throated thrush and dreamy nightingale:
And scents the flowers in the close,
Soft mignonette, heartsease, and rose;
And notes lotharal bees their treasures snatch
From out the honey laden clover patch:
And 'mid the pains of hoary winter black
Knows that they one and all are coming back.
Deep in his heart he hears the joyous ring,
And feels the promise of recurrent spring.

John Kendrick Bangs (Selected)

The Soul of Brotherhood

EVERYONE who has seriously made the attempt to stand aside, at times, from the rush of the world's outer life, and to face the problems which life itself presents to the thoughtful mind, becomes, in the very act of so doing, a student of those mysteries of human nature which man has been trying to solve for ages.

In the prehistoric past, the sages who taught mankind knew much more about human nature than we do today. The true solutions of the mysterious problems of right and wise-action have been hidden from us for many dark centuries. Empires have risen and fallen into the ashes of a bitter experience. But he who reads carefully the signs of the present time, may see the universal seeking for a return to something higher and better; to a newer and truer and greater life. The lost mysterious truths about man, his nature and destiny, are being revealed through the teaching of life itself. The time has come again for the knowledge of the Lost Mysteries of Antiquity.

Of these mysteries, the central idea is involved in the true understanding of the word Brotherhood in its fullest, widest, and deepest sense. It has two aspects which cannot be separated. The one is an intellectual concept of the mind, which compares and co-ordinates the various aspects of life. The other is a quality of the inner man—of the very soul of every human being—a quality which burns within the heart, eternally, from age to age, as man progresses in the experience of his appointed destiny.

It cannot be too often reiterated that man himself needs to be awakened to a knowledge of his own qualities and possibilities. The maxim of the ancient sage, "Know thyself," is more needful now than ever before. For if each one of us cannot recognize for himself these truths and know them for his own, it is useless to take them at second hand, unless indeed he be convinced that others have in greater measure that which he needs, when, if he proceed to find it within himself, the conviction will lead to further enlightenment.

Looking carefully at the literature, the folklore, and the history of all peoples, it is not difficult to realize that the hidden motive of much which is otherwise inexplicable may be explained by this brotherhood of the human heart. There is a certain something which is awakened within us when we hear of deeds of self-sacrifice for the good of others.

The unselfish heroism of the Japanese soldiers, in the late war, and their unselfish patriotism, have won the world's respect and admiration. We gladly recognize them as well qualified members of the human race. We feel that we know them now better than ever before.

How often do we find in that fiction which is but a reflection of our common life, the story of a man who, at first having been but lightly esteemed, because incapable of more than a butterfly existence, suddenly displays, when the occasion requires it, a capacity for courage and self-sacrifice of which nobody had dreamed. What is the quality within us which does him honor? Surely it is not the brain or the mind which recognizes the man's greatness. There is a thrill that goes deeper. Do we not take him to our hearts? Do we not truly say, "This is a man indeed"? Do we not immediately regard him as a worthy member of our common humanity?

It has been remarked by those who are in daily contact with the criminal population that there is most hope of reformation for the man who displays a disposition to help his fellows. A governor of one of our large State penitentiaries has said, "There is always hope for any man who is touched by the distress of a little child."

Which of us is not conscious of the feeling of joy and satisfaction which comes from giving pleasure to others? Let us say we have seen a beautiful view, or we have been to an interesting play at the theater. How glad are we to go again and show it to someone who will take pleasure in it. We would not go the second time for our own pleasure, but perhaps we enjoy it more the second time than we did the first, if our companion joins in our appreciation of the beautiful.

It would be endless to multiply instances. They will occur to everyone. The point of which we may easily convince ourselves is boundless in its application. That point is: that the fact of Brotherhood is now and ever will be the central heart of the subconscious life of humanity. It is the faculty which recognizes, without discussion, that altruism or selflessness is the great ideal to be attained. And when we say attained, we mean attained, not merely talked about and theorized over, but striven for as the most potent factor of our common life; and one so potent and all-embracing that it can be made the solvent of all the social and political problems of the day. It is the elixir vitae of the alchemists of old.

History relates how powerful empires have fallen from their high estate as soon as this quality, which was necessarily present in their early struggles, gave place to selfish luxury and disregard of the common good. There was a time when the Roman could proudly exclaim: "Civis Romanus sum—I am a Roman citizen." But the elixir of life was not with the great republic, and it is now no more.

What would be the effect, in all nations, if a larger realization of this great quality of the human heart came into play?

Let us suppose for instance that in this United States of ours, which we believe to be on the wave-crest of the civilization of the 20th century—let us suppose that the public conscience became awakened so that there were no longer slums in which little stunted children were neglected or starved or overworked; that no dens of infamy disgraced the great cities; that measures of reform were established to do away with crime, but save the criminal; that scenes of public vengeance were no longer enacted; that "graft" came to be regarded as a foul dishonor, a public shame to levy toll stealthily out of the needs and sacred rights of the people—that in short the feeling of Brotherhood were so awakened in the hearts of the American people that private or public calamity, suffering, or crime became a burning question of the heart, of vital interest to all men. Then the elixir of life would be introduced into the nation, and Brotherhood would become an actual fact in the life of the people. And then, abroad or at home, everyone of us could say with thankful pride: "I am an American Citizen."

Let us wait and see what the 20th century will bring forth.

Whence arises this feeling, this inward consciousness that the public good should be the supreme factor? Do we not intuitively recognize without the need to express it that he who has the power can only use it fitly for the good of his fellow men? But we are still hypnotized by the feeling of the age—which is the result of the past. Our hearts do not have full play. We do not take these questions to ourselves and make them our own. Too often, like the man in the parable, we pass by on the other side.

To remedy the condition of affairs existing in this, or any other nation, it is necessary to act wisely and to bear in mind the essence of the idea involved. To be effective, reforms can rarely be brought about violently. But once the principle involved is fully realized the results will follow of themselves.

There is a battlefield within every human breast whereon a struggle is constantly going on between this quality or feeling of Brotherhood and its opponent, which is Selfishness. Peace and happiness are the result when the former rules, and so it will ever be. Every other man is to each of us but another self, built in the same image. Harmony is the result of identity of effort. Consider what would be the effect in a family of say seven people, if each one were honestly trying to promote the welfare of the other six regardless of his own. Surely it is plain to see that none of this group would suffer if the others could avoid it. But even if this were not so it must not be forgotten that "it is more blessed to give than to receive." An active and positive determination to act with good will to others is a positive benediction and brings with it its own reward. It is the outflow of the divine power in the heart.

The feeling of Brotherhood is one which is too little regarded in our modern civilization. Yet were it not for the little we do have we may well believe that many of the poorest people in the world would give way to despair. Those great hearts who have gone forth as helpers amongst the wretched and starving populations of great cities all over the world, relate the most wonderful instances of their heroic unselfish help to one another. The working-man often has this great quality far more developed than the college professor.

Brotherhood is the essence of true religion. The apostle Paul says: "True religion and undefiled before God and the Father is this: To visit the fatherless and the widows in their affliction and to keep oneself unspotted from the world." This feeling of good will is all-embracing. Like the sun, it shines upon the just and upon the unjust. It pities both the criminal and his victim. It carries hope and light to all whether gentle or simple. There is no graft about it. It has no axe to grind. It is unsectarian and non-political.

Brotherhood is not a mental abstraction, but a consciousness which may be caught from those who have it. It is infectious. It recognizes as its end and aim in life the uplifting of one's fellowmen. It is the spiritual nature of man made manifest. It wipes out of existence the opposing forces of evil which aim at man's enslavement, either mentally, morally, or spiritually. It is the universal panacea for the ills of humanity and though it may take ages to bring about its perfect work, yet man will grow nearer and nearer to this great Central Sun as the centuries roll on.

The recognition of Brotherhood as the great factor in human life, is the basis of the existence of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY. Two of its Leaders have already lost their lives in the promotion of its objects. The third Leader, Katherine Tingley, works unceasingly day and night in unselfish efforts to bring Truth, Light and Liberation to her fellowmen. The example is set everywhere by this Society in all kinds of efforts to relieve suffering Humanity, to educate destitute children, and restore to the human race its lost ideals.

C. W.

OPPORTUNITY

WHO art thou, glorious form, flashing by me,
So beautiful, so Godlike—wilt thou fly me?
Why o'er thy face and bosom fall thy tresses
streaming,
And why the airy pinions on thy white feet gleam-
ing?—

My name is Opportunity. Pause or rest I never:
Mortals rarely know me till I'm gone for ever.
To seize me passing on to few is granted;
Therefore one foot upon a wheel is planted—
Therefore the light wings bound on them, to make
me

So quick in flight that none shall overtake me.
Down fall my tresses, face and bosom veiling,
That none may know me 'till to know be unavailing;
Then, mockingly, I fling aside the veil and please
me

With their vain hope and vainer haste to seize me.
And who is this dark form that follows thee with
weeping,
Ever as a shadow on thy bright track keeping?—
Her name's Repentance. When I flit quickly by
them

She stoppeth weeping, vainly weeping nigh them.
But thou, poor mortal, precious moments wasting,
Idly thou drest while I'm onward hasting.
Wilt thou not wake? Alas! weep now, I've passed
for ever,

Weep, for Repentance henceforth leaves thee never.

(From the Italian of Machiavelli, translated by
"Speranza")—Selected

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question What interpretation does Theoso-
phy give of Matthew x, 28:—

"Fear not them which kill the body: rather fear
him which is able to destroy both body and soul
in hell?"

(The above question was answered in the CENTURY
PATH for Feb. 14th, and the following additional
answer has been received.)

Answer Is it suggested that this text
refers to a personal devil,
decked or not with horns, hoof, and tail?
Take the more obvious view of it rather, and
remember that heaven and hell are both con-
ditions of being in this world, and that we
are always in one or the other of them, or
else pendant midway between the two, and
oscillating up and down. When the light of
our divinity comes upon us, and we live and
do and think like men; when our moments
carry themselves royally, and go out laden with
beneficence, then we are in heaven; when we
are submerged in the lower life and deafened
with the clamor of bodily desires, our minds
all in a flame and tumult and unrest; then we
are certainly in hell.

All the offal of Jerusalem was carried out to
the Valley of Gehinnom or Gehenna, where
fires were always kept burning to consume
some part of it; the other part, we may con-
jecture, being left to the "worm which per-
ished not." Certain it is that in any such place
you are likely to find those two consuming
factors fire and vermin, as much today as
then. Jesus saw in this place a grand figure
of the fate of the useless and degenerate and
malicious portion of mankind; and so may
we, too; with the aid of a little Theosophy.

There is a general will throughout all these
worlds, which is, that we shall go forward.
All existence became manifested, says Theo-
sophy, for the sake of learning new things, of
advancing farther into the kingdoms of ex-
perience and winning new treasures. Chaos

is a kind of Tom Tiddler's ground, which
manifested life invades; and the gold and
silver treasures are events, sweet and bitter; all
kinds of events, out of which we gain the ex-
perience whose fruitage is wisdom. The order
was given at the beginning, *March; go for-
ward!* and none can stand still nor fall out
nor turn back without infringement of eternal
discipline. The everlasting will is, to go for-
ward: *Thou shalt learn* is the commandment
of commandments. Learn by thy mistakes;
thy miserable failures and misdoings; wert
thou ever cast utterly down and crushed, there-
in, too, is thy glorious opportunity! Thou shalt
learn, learn, learn.

This heterogeneous and many conditioned
world has encased us around with selfhood;
made each of us an acute "I"; itching points,
at one time or another, of greed, anger, arro-
gance, and all the passions. At least we have
been set down where these infections are, to
be torn and inflamed according to our vulner-
ability. What was the purpose of it all but
that consciousness should be focussed; should
well up in these little vehicles, and boil and
surge until the boundaries could no longer be
endured? Thou shalt learn, and that by pain
if no other means will teach thee.

God exercises himself through all these man-
ifested universes: in every embodied form con-
sciousness is heightened, refined, distilled,
rarified. In the animal world the spirit learned
passion, as was well for it then to learn: but
for human beings passion is yesterday's halt-
ing place, and the order is still "Go forward!"
There are new worlds and new oceans ahead.
We have not reached yet, or are but barely
reaching, that spiritual "peak in Darien"
wherefrom the blue expanse that girdles won-
derland shall be revealed. For what was the
New World to Cortes, and Eldorado and all
the mysterious bediamonded realms, compared
with that human kingdom for which we are
destined when we will but rise up and go on?
Treasures and treasures are beyond; and all
that was our joy yesterday; passion that we
cling to now, and the warfare for self and self-
love and worship, shall seem but graceless,
ineffectual baubles, and indeed loathsome
growths and poisons.

But though the whole universe will set in
one direction, no man can be compelled to
march. The Law will take no man by the
shoulders and drag him upwards. Cling to
the old sweets who will, he shall only find
them abominably sour and bitter. Face round,
fall out, go backwards; you are at liberty to
do so. But when the rear has vanished after
the van, you shall find no comfort on the lone-
ly road. Thereon is but corruption and de-
bris and decay, and great loneliness and ruin.
You have forced yourself out; and these were
the joys you longed for. Self called you, and
now you have it all to yourself.

Whenever we set up self against all being,
some little of such isolation falls upon us, and
we are a little more encased away from every-
thing beautiful and to be desired. It is true
that we have made this aloneness normal. We
have grown used to a touch of the spur, and
impervious to less than vigorous stabs; yet
it is demanded that we should awake, and
be ashamed of the pettiness to which we have
reduced our being. Even we, the mediocre,
the average of humanity; we do not lie too
easily, do we? Our bed that we have made

us, is more of thorns than of down. We have
ensued selfishness sneakingly, and not in the
grand manner; yet too many of us are apt
to call the world hell. Even so; it is as we
make it. Many heads lie uneasy, that wear
no crowns. Many an old brimless hat, and
many a well-brushed respectable one, covers
a multitude of unrest and chafing; many a
prisoner's shorn skull, and many a skull that
never contained the wit to think out that
whereby it should get shorn and in prison.
The whole world is troubled enough, although
so many degrees intervene between our re-
spectable selves and those who deliberately set
themselves to injure and hold back the people.

Can you doubt that there are such? Unto
whom was it woe should be? The Hypo-
crites. The men who compassed the whole
earth to get one proselyte, and when they had
found him, made him ten times worse than
themselves? There are a number of verses
devoted to them, and a long list of these in-
heritors of Gehinnom. And for those who
are not content with falling out of line of
march themselves, but exercise themselves to
have whole companies fall out with them, de-
ceived by their specious influence, who would
sacrifice races and human souls and fight
against evolution—for them there certainly
shall be "weeping and gnashing of teeth."
For when mankind has become divine, and in
full exercise of such power as is suitable to
divinity; these shall have been, perhaps, left
behind; they shall be, perhaps, still but little
better than brutes.

Whenever there is one using what power he
has against mankind he is doing it at his own
loss and peril. Though he seems richly en-
dowed, he is heading toward pauperism; for
it is his inward capital he is spending. P. K.

TO do good to others; to sacrifice for
their benefit your own wishes; to love
your neighbour as yourself; to forgive
your enemies; to restrain your passions; to
honor your parents; to respect those who are
set over you: these and a few others are the
sole essentials of morals; but they have been
known for thousands of years, and not one
jot or tittle has been added to them by all the
sermons, homilies, and text-books which moral-
ists and theologians have been able to produce.

That the system of morals propounded in
the New Testament contained no maxim which
had not been previously enunciated, and that
some of the most beautiful passages in the
Apostolic writings are quotations from Pagan
authors, is well known to every scholar; and
so far from supplying, as some suppose, an
objection against Christianity, it is a strong
recommendation of it, as indicating the intimate
relation between the doctrines of Christ and
the moral sympathies of mankind in different
ages. But to assert that Christianity communi-
cated to man moral truths previously unknown,
argues, on the part of the assertor, either gross
ignorance or else wilful fraud.—H. T. Buckle
(*History of Civilization*, Vol. I, p. 180.)

We stand at the parting of the ways, where
the one path leads down the acclivity to the
dark valley of ignorance, and the other climbs
upward toward the pure celestial level of being.
For us it is to utter the cry of warning and
the word of encouragement; *he that hath ears
to hear, let him hear*—AND BE WISE.—
H. P. Blavatsky

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

The Value of Your Life

THEOSOPHY teaches every one of us the value of his own life. Ordinarily people underestimate the value of their own lives. They pride themselves on little things which are not very creditable and ignore the real values of their character. This is vanity. They assert the personality, which is a trivial, trumpery, and often rather unpleasant thing; but the individuality, which is the real power, they suppress.

The spirit and teachings of our civilization set a high value on the personality and on the mere externals and incidentals of human nature. Our system of education aims at developing these to a high pitch. But the essential parts of human nature are overlooked and not developed. Consequently the person grows up weary and ill-balanced; he is merely one of a crowd, he counts for little if anything.

Religions, as taught in the Occident, tend to promote in man a suppliant and expectant attitude. They tell him that of himself he can do naught and that he must pray for grace and mercy. Science seems to have a mission for reducing man to the lowest possible terms, by attempting to belittle his origin and his destiny, and by trying to explain his marvelous gifts of intelligence as merely sublimated animal functions.

The undying Spirit of man, implanted in his breast by his Divine derivation, rebels against this belittling of him, but can find no support in any of the existing schools of thought, whether religious, scientific, philosophical, or speculative. Theosophy alone gives man the full warrant for estimating his own nature in terms of due self-respect.

In Theosophy alone it is made clear how a single individual can, by his own right living, become an enormous power for good in the world. For Theosophy alone recognizes the reality of the Spiritual powers in man and the invisible channels by which those powers can act, conveying their influence far and wide.

It is unnecessary to say that these Spiritual powers are not those so-called "powers" spoken of by the "psychists" and "new-thoughtists," which seem to be merely an intensification of selfishness and vanity. Such powers as these latter can have but little influence, as they are on too low a plane. Spiritual powers can only be called forth by devotion to the highest ideals. If there be a self-

MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large", or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed: it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

ish motive present, it will confine the operation of the force to a narrow circle and a low plane,

Ordinarily people think that their only channels of action are through visible acts or words; and a great deal of influence can undoubtedly be exercised in this way. But there are other and invisible (to the bodily senses) channels of action. These are on the thought-plane. Such channels do not count for so much in ordinary persons, because these persons live mostly in externals and in the little circle of their own mind. But in the case of one who has devoted himself to the Great Cause, these channels of influence become much more potent. Hence such a man diffuses good and beneficent influence around him by his mere existence.

Entry upon the path of duty and service soon enlarges the scope of our opportunities and opens our eyes to new conditions where our services are called for. A larger world opens out before us, as we step outside the boundaries of our own private interests. Thus life becomes fuller and richer, and silences, which to many are horribly tedious, become pregnant with meaning.

Theosophy would urge upon each and all the importance of the individuality. There is no saying what latent powers one may have in him which may become manifest when he allows himself to develop along right lines. The mere resolve to step out of the old selfish or indifferent life into a larger sphere places the aspirant on a higher level, from whence he can see farther. Such a resolve, made by the spirit of faith and devotion, is rewarded by fuller knowledge; but such knowledge does not drop in the lap of the waverer and the doubting. One needs to be convinced that the good in human nature is worth fighting for, and to make the effort. The churches do not emphasize the fact that knowledge follows upon the vow to serve the Truth. Yet Jesus emphasized it. Theosophy would open up this way again to humanity, thus restoring religious truth to its rightful place. STUDENT

Did Christianity "Invent" Compassion?

HE lets his mind pervade one quarter of the world with thoughts of Love, and so the second, and so the third, and so the fourth. And thus the whole wide world, above, below, around and everywhere, does he continue to pervade with heart of Love, far reaching, grown great and beyond measure.

Just as a mighty trumpeter makes himself heard, and that without difficulty—in all the four directions—even so of all things that have shape or life, there is not one that he passes by or leaves aside, but regards them all with mind set free, and deep-felt Love. Verily this is the way to a state of union with Brahma.

And he lets his mind pervade one quarter of the world with thoughts of pity, sympathy, and equanimity, and so the second, and so the third, and so the fourth. And thus the whole round world, above, below, around and everywhere, does he continue to pervade with heart of pity, sympathy and equanimity, far reaching, grown great and beyond measure.—*Sacred Books of the East*

The above quotation answers the question, especially if we take it for what it is—a mere sample. Many more such might be given. It also rebukes those who say that the teaching of Compassion is absent from Indian philosophy. Union with the Supreme (here called Brahma) does not mean annihilation or abstraction; it means a state of the most active consciousness and beneficence. T.

The Viñales Valley, Cuba

ONE of the excellent new highways in Cuba, says the *Scientific American*, leads from Pinar del Rio through the Viñales Valley to the seaside at Esperanza. After winding through rich green tobacco fields decked with patches of yucca, mango, and aguacate trees, and among steep cliffs whereon are many huts, the crest of the divide is reached, and one drives abruptly into the Viñales Valley. It lies among peculiar monolithic hills which the natives call *mogotes*, and which are said by geologists to be unequalled in their class anywhere. They are huge limestone pillars, hundreds of feet in height, which stand sentinel-like on the plain, isolated and seemingly out of place in the landscape. Strange tales are told among the natives of the mythical origin of these columns; but geologists say that once long ago there was a huge cave in what is now this valley, within which great stalactites and stalagmites were formed. These uniting in the course of ages formed massive pillars that supported the roof of the cave. Finally the roof fell in. J.

Katherine Tingley Speaks at Isis Theater

ISIS Theater was again crowded last Sunday evening from floor to ceiling to listen to Katherine Tingley on "Woman's True Place in Human Life."

The following is taken from the San Diego Union of March 8th:

MRS. TINGLEY ON WOMAN'S TRUE PLACE

FULL EXERCISE OF GOD-GIVEN POWERS WOULD BE MORE POTENT THAN VOTE

Asserting that many women are good merely because they are afraid to do wrong, Katherine Tingley in an address last night on "Woman's True Place in Human Life," pleaded for the cultivation and development of the "spiritual will that lies back of every human heart and mind," and the awakening of woman to a realization of her own potentiality in shaping her own life and those of others, and to her real mission in the world. The meeting, held at Isis Theater under the auspices of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, was largely attended.

Great stress was laid on the influence for good which a woman possessing full knowledge of her own powers and in full exercise of them could exert over the other sex—an influence that should be of far more avail in the uplifting of humanity and the advancement of every good cause than women can hope to exercise by securing control of the ballot.

Mrs. Tingley, after announcing her subject, led up to her message of the evening by describing some of the various types of women that have come under her observation, drawing in masterly fashion word-pictures of these types that appealed to her audience as remarkably true to life.

DESCRIBES WOMAN MATERIALIST

First there was the woman materialist—self-satisfied and selfish—confident that she is capable of working out all problems of life on her own account. "Such a woman knows little of the spiritual life; satisfied if she is comfortable, she has no glimmerings of soul life or an inner life."

With equally happy touch the frivolous woman was described—the woman who flutters one day toward her own shallow conceptions of what is beautiful in life, and the next is in the depths of despair. "Such a woman touches some beautiful things in life, but does not stay with them," said Mrs. Tingley. "Thinking early of marriage, albeit little of its responsibilities, she has little time for childhood and none for the period of sweet girlhood. As a mother she values her progeny because it is hers, not for what its life and future may be, not to develop them spiritually or in the highest things."

Then allusion was made to the great body of outcast women; the women habitually in error because their environment makes them so; women who have lost sight of the spirit of true womanhood.

WOMAN SUFFRAGIST DESCRIBED

Concerning the next class described—the woman suffragist—Mrs. Tingley, while paying tribute to their intellectual attainments and devotion to principle, declared they were misapplying energy that, rightly directed, would achieve more in uplifting the race than they could ever accomplish by the ballot. "The merest tyro of a Theosophist could tell these

women it would be wiser to work along the lines of least resistance," said the speaker, who declared that if all women became suffragists the men would be driven into the desert.

The last type of woman described was the class in which the spiritual was dominant; the woman who believes in the higher law, is conscious of a higher nature, and has a mind subservient to higher powers within herself, but who is so isolated and so lacking in definite knowledge as to how these powers can be brought into play that she drifts from her moorings or steps into action on some plan in which she fails because she has not learned how to use her powers.

ONE THING IS LACKING

"Among all these different types of women the same thing is lacking," said Mrs. Tingley, "and that is a strong spiritual will. This is the power behind the throne in every human being, but through

responsibilities of parentage, was drawn by Mrs. Tingley. Declaring that fully half of present-day mothers think more of the trousseau and the material advantages involved in the marriage of their children than of the sacred side of the union, she asked if it were not true that marriage in its present state is not distorting womankind.

"Woman's duty is to make noble men," she concluded. "Put woman in her true place, and man will find his."

The musical features of the program, which were classical selections by the Rāja Yoga Orchestra, proved a rare treat.

Before beginning her address Mrs. Tingley warned the tourists in the audience of misrepresentations which she had heard were being made by drivers of Point Loma tally-hos, by which many intending visitors to the Theosophical institute were being deterred from making such a visit. She stated that all such visitors were welcome.

(Stenders Förlag, Stockholm)

lack of understanding and exercise it is too weak to amount to a real force in directing the life. While many women are good because they fear Mrs. Grundy, they are not forcefully, constructively, and spiritually good because they know nothing of this spiritual will. Many are cramped by the old creeds in which they and their ancestors have been drilled; by teachings in which the 'bad place' is a sample.

"Until aroused and set upon the right track, woman cannot know herself, she cannot realize who or what she is, or know what part she has to play in life. She will not even touch the fringe of truth."

That a study of Theosophy would result in this knowledge that would lead to woman's "finding herself" and put her into possession of her real powers by calling into exercise her spiritual will, was shown by the speaker. "Theosophy points the way," she declared. "A woman who is conscious of her higher self and knows how to adjust this spiritual will can never be disappointed."

CONTRAST IN MARRIAGES

Striking contrast between "marriage a la mode" and that of an ideal couple attuned to all beautiful things in life, in full possession of all the powers that make for good, and fully awake to the sacred

Katherine Tingley has announced that she will speak again at Isis Theater on Sunday, March 14, on "The Drink and Drug Habits considered from a Theosophical Standpoint"—a vital question of the day. OBSERVER

The Biblical Creation was only a Reconstruction!

IT appears, from an editorial in *The Pathfinder*, that the editor of a Christian paper has gotten into controversy with his readers over the question whether the world existed before the creation. He says that it had; the Bible says, "In the beginning God created the heaven and the earth," and we may assume that there was a long period before the "first day." Even if it should be proved by geology that man existed before the creation, still this would not invalidate the Bible story. In short, he thinks the creation spoken of in *Genesis* may have been rather a reconstruction of the world than the original foundation of it. A deluge may even have occurred prior to

that of Noah. In fact, he is willing to give the geologists all the time they require, and that without abating one jot of his faith in the Bible narrative.

Accommodating, very! Some people cannot be downed; they will maintain their position as long as they possibly can, and, when forced to yield, will yield as if yielding were the one and only title to true pre-eminence. One cannot wonder that some of his readers remonstrated with him for his facility in giving away the whole position, and in turning the Creator into a minor cyclic deity and his creation into a geological episode. Perhaps they wanted to ask him how many times the world had been thus created before, and whether by the same God every time or by different Gods. In fact numerous such questions naturally arise in the mind.

It may be pointed out that there is nothing, so far as one is aware, to fix the date of the Biblical creation; so that the minister might have claimed that the story refers to a time previous to all geological history. But we presume that the subsequent history of the patriarchs is taken to be continuous, and that therefore the date of the creation cannot be put very far back. There is also the difficulty about Cain's wife.

As has been frequently pointed out in Theosophical literature, the Biblical story is an almost inextricable confusion of sundry elements. To begin with, two distinct creation allegories have been blended. In *Genesis I* he makes the beasts first and man afterwards; but in *Genesis II* he makes man first and the beasts afterwards. The two accounts of the creation of man refer to two different things. In the second chapter man is made a "living soul"; and if the reader will refer to a reliable concordance, he will find that the word translated "a living soul" means "an animal soul." This was the first creation, when the vehicle of the future man was created. Afterwards this animal man was informed with the Divine Spirit and made in the image of God (or rather the Gods—"us"). These allegories belong to the Secret Doctrine of the ages, and have been handed down from nation to nation from time immemorial, the Hebrews having apparently obtained them from the Babylonians. They treat of the origin of man; and, so far as they refer to time at all, that time must be placed back hundreds of millions of years, at the dawn of the present Manvantara.

Then we have the allegory of the fall of man into animalism, owing to his abuse of the divine gift of independent intelligence and will. The Serpent stands for man's own senses and passions and faculties, which he failed to dominate, and by which he was therefore enslaved. But there is a prophecy that man shall one day be redeemed by the "Son" of God—that is, by his own Higher Self.

There is a flood story, such as may be found in religious symbolisms all over the world. It refers principally to one of the latest great cataclysms in which evil civilizations of great power were destroyed and a remnant of the good saved to produce future races. Everywhere among old traditions we shall find this story of the black magicians or giants being destroyed, while the other classes of beings were preserved for a higher evolution.

Thus we have to understand that the Bible

narrative is merely one out of many, and that it is a very confused example of its kind. It should be studied in connexion with ancient symbology in general; as only by thus comparing it can we hope to gain a true idea of its real significance. The study of the symbology of the Secret Doctrine is a very profound one, but those who undertake it will be richly rewarded. It has been one of the purposes of Theosophy to call the world's attention to the riches which the world possesses in these ancient allegories, and thus to rescue the sacred records from the disrepute into which they have fallen through being misunderstood.

STUDENT

The Cultural Significance of the Nobel Institution

What Professor Eucken, one of the Prize-Winners, says about it

(Translated from *Göteborgs Handelstidning*, January, 1909.)

IN the *Allgemeine Zeitung* appears an interesting article by Professor Rudolf Eucken on "The Cultural Significance of the Nobel Institution," in which he first recalls how the Nobel prizes every year arouse the interest of the whole civilized world, though there are not many as yet who have realized their deepest significance. To Eucken this significance seems to lie in the fact that they aim at furthering in culture a development that will not be hindered by any barriers of special research or of nationalism, since it regards the welfare of the whole.

He says:

The present time is an age of specialists; by our earnest work in special directions we easily lose sight of the whole and do not appreciate it—the whole, the essential, the simple. The Nobel Institution, on the contrary, promotes a culture which goes beyond the border of any special activity and promises to help life as a whole.

Again he says that Sweden's yearly part in the distribution of the Nobel prizes is, in this age of nationalism, a healthy means of keeping people together by those interests which are common to all human beings and by the free and elevated standing which the very highest culture bestows. According to his view, Sweden is peculiarly fitted to look out upon the world from this high position, thus allowing the great thought of the founder to be realized. "Prominent men and corporations regard the matter with the greatest earnestness and the most scrupulous care, and look upon it from the highest viewpoint"; and the corporations that administer the prizes are, according to the impression he got in Stockholm, firmly resolved to maintain in their bestowal the universal character and not yield to home nationalism.

Eucken thinks that in this respect the Swedish people feel themselves to be the representatives of humanity, and that this was the reason why, during his stay in the country, he felt "such an atmosphere of pure mountain air."

The above remarks strike the keynote of unity in culture, a quality which, as the writer says, is somewhat deficient in this age. To the Theosophist, more than to any other, is the unity of knowledge a sacred ideal. In common with many who are not Theosophists, he abhors that mental condition which permits knowledge to be divided into the two separate spheres of religion and science; but, unlike them, he knows a way of escape from this

untenable position. Refusing to separate the feelings of duty, reverence and awe, which pertain to religion, from the inquiring zeal of the intellectual faculties, he looks upon the whole domain of knowledge as consecrated alike to service and to discovery. In both religion and science, as we have them today, he recognizes but the disinherited and exiled descendants of the primeval Wisdom-Religion. Ignorant of their great origin and of their community of blood, these brothers, believing themselves to be strangers, are trying to patch up between themselves a strangers' compact by which they may sink their irreconcilable differences. But only by forsaking the divergent paths in life into which they wandered can they meet again in that one which is common to both, the path of service to Truth and Justice. It is for want of pursuing this ideal that the specialists have strayed off into byways. Because the study of physics and chemistry does not invariably have before it the idea of service to humanity's best interests, it wanders into blind alleys; because the culture of literature aims too often at satisfying some minor idea, it loses itself in pleasant but unfrequented glades; because art does not always aim to elevate and inspire, it finds itself occupied in the vain pursuit of butterflies. It is the aim of the Nobel Institution, we are told, to bring a spirit of unity and harmony into all these divergent branches of culture and to set them, as far as possible on a common track. It distributes its prizes impartially to the researcher in his laboratory, the writer at his desk and the artist in his studio. It favors no clique or academy; it gives weight to the opinion of the general.

What is the true and immortal function of art? Is it not to paint pictures, carve statues, compose music, that shall elevate him who sees and hears out of his little personal world of fears and calculations into the harmonies of that greater world that interpenetrates all our lives? We see, among the works of painters, faces and figures; but how often do they inspire us with grand ideals of the possibilities of human nature; how often do they represent ideals of purity, Divine Wisdom, Divine Compassion? Too often they are but studies of human nature as it is in all its imperfections, or suggestions of a kind of beauty that appeals more to the emotions and passions. Might it not be possible for some great artist, if moved by the true spirit of service, to paint such a picture of manhood or womanhood as should set the soul of the beholder aflame with the resolve to do and achieve that he might realize all that was best in him? And might not the musician compose music that would not merely enrapture the senses or set the mind puzzling as to its subtle meaning, but fill the hearer with a longing that he could not quench for a life of purity from desire and freedom from self? And might not science, if its votaries were more filled with the modest zeal of the true craftsman in the temple of humanity, spare a little time from too engrossing research into the outer crust of things and devote it to inquiring into the laws that govern harmonious living; and, in place of inventing new tools, seek rather to strengthen the hands that use them? In short, would not the common object of loyal service to the great Cause unite the sundered factions of culture into one guild?

E.

Art Music Literature and the Drama

Carl Larsson—the Swedish Painter

CARL LARSSON is a genuine son of Stockholm. He was born in 1853 in one of the darkest and narrowest corners of the old city, founded as long ago as the 13th Century on the island between Mälaren and the sea. He has always preserved something of the characteristic light humor of the Stockholm child. His grandfather, however, was a peasant from a place in Södermanland (the province next to Stockholm) and he was said to possess the eye of a seer. He prophesied that his grandson would become either a great rogue or a great man. The latter part of the prophecy is certainly true in regard to Stockholm's most beloved painter, but there may also be something true in the first part, for he has always been fond of jokes.

Carl Larsson's home was poor, and from his thirteenth year he had to earn his own living. He worked in the atelier of a photographer and began at the same time to make drawings for humorous papers. Gradually he got book-illustrations to do. Through this kind of work he became a daring and ingenious designer, his manner of drawing became swift and elegant, and his imagination was aroused by fantastic tales and bold adventures. All the traits which are still most characteristic of the artist were developed.

He also studied at the Academy of Arts, but his talents were not suited for academic precepts, and he had little success at that institution. With the money he had gained in book-illustration he went to Paris and then began a time of hard work for the young man.

From the first he wanted to do something extraordinary. He made a canvas three meters high and began a scene from the Deluge, the figures being larger than life. But the picture did not progress as he expected; he had not mastered the anatomical difficulties, and he had scarcely enough money to pay his models. The works he sent home from Paris at that time (1877) evoked no enthusiasm in Stockholm, and the learned academicians began to say that Carl Larsson would never become a real painter. They advised him to be satisfied with the rôle of a simple illustrator. He returned to Stockholm for some time and worked extremely hard illustrating the works of various Swedish poets and other writers. In 1880 he went back to Paris and tried again with large, fantastic pictures, one of them depicting "The self-murderer's way to Hell." But he had no success with those bold attempts, and it was not until the springtime of 1883 that he found the motive and the methods of expression which opened to him a sound and steady artistic evolution.

Together with several other Swedish artists he lived in a little village called Grèz, close to the Forest of Fontainebleau, a lovely and picturesque place, where the Swedish flag floated at that time over the door of the Hôtel Laurent. Carl Larsson began simply to paint what he saw: the garden with flowers and sunshine; the orchard where the old gardener is cultivating his trees; the young peasant girl smiling in the sun, etc. He did all these things in water-color, and succeeded in catching just the right note of French summer light. People began to see that he was a most refined *aquarelliste*, and that he understood how to use the colors with the same delicacy of touch as he drew. It may be said at once that Carl Larsson has ever remained a much finer painter in water-colors than in oil. His best things are either frescoes, painted directly on the wet wall, or pure water-color pictures. Both the French and Swedish Governments hastened to buy some of his small water-color studies from Grèz.

There happened something else to Carl Larsson at Grèz, for he met a young Swedish lady there, whose name was Karin and who became his wife. He himself has testified many times that this was the principal turning-point in his career. It was at least to him the door to that "motiv-circle," that source of inspiration, which has become the property of Carl Larsson more than of any other painter—the *Swedish Home*. When you mention his name today everybody connects it with a whole series of pictures illustrating indoor and outdoor life in Sweden, and there is nothing he has painted so well and so often as his wife and children.

But, of course, when he returned from Paris he had to do some larger things too. A rich Maecenas at Gothenburg, Pontus Furstenberg, gave him a commission to decorate the walls of his palace, which was filled with treasures of Swedish and French art, now in the museum at Gothenburg. The painter chose three motives from the history of art, i. e., the Renaissance, the Rococo, and Modern Art, all depicted with more good humor than monumental feeling. An interesting and very characteristic part of the last-named composition is formed by the artist himself at the easel receiving instruction from a Japanese at his side. Carl Larsson has learned much from Japanese art; his light touch and expressive line have been greatly influenced by Japanese water-colors and prints.

Of his other large decorative paintings we can mention here only the six frescoes in the entrance hall of the National Museum at Stockholm. They represent different episodes from the times of King Gustavus the Third, the most artistic king of Sweden, and include scenes with Bellman and Sergel, our Anacreontic singer and our Phidian sculptor. Another of the pictures represents the king greeting some antique sculptures on their arrival from Rome.

These pictures are executed in a style quite unlike anything else we see on the walls of modern European museums. They are not treated as realistic scenes from life, but rather as a kind of imaginative representations, shown on a wall which still gives the impression of its real substance. Carl Larsson's art, as a whole, is more an expression of his imagination and of his heart than of his eye; and that is probably one of the reasons why he has penetrated so deeply into the hearts of his countrymen.

This imaginative quality has found a very delightful expression in one of his school-pictures. This large composition, which is to be seen on the wall of the staircase in a school in Stockholm, represents the "corum" of the boys and their teachers—that is to say, the formation of a large semicircle by the scholars in the fields outside the town for the purpose of devotional exercises before the commencement of their military drill. The principal part of the picture (above the door) consists of the symbolic representation of the prayer: a white dove in a sphere of light against a background of sunflowers, and a little girl in white with flowers in her hand. The child is, so to speak, the human explanation of the holy spirit, descending upon the young warriors. The manner in which reality, or rather materiality, and imagination are here connected is most characteristic of Carl Larsson; all the people on the ground are portraits. He is constantly explaining the objective world by some little hint from his great heart or his luminous imagination.

The six National Museum frescoes were finished in 1896, but not until last year did the artist get the opportunity to complete the series by the addition of a large composition over the staircase, representing

the entry of Gustavus Vasa into Stockholm on Midsummer's Day in 1523.

The painter has chosen the moment when the young hero on his white horse is crossing the draw-bridge in front of the town gate. He is followed by some rustic warriors representing the peasant army with which Gustavus liberated Sweden, and by horsemen with flying standards. Before the gate stand the authorities of the town assembled in order to welcome their liberator; the old white-bearded burgomaster is bowing deeply, with the keys in his hand. The bridge-posts are decorated with wreaths and garlands of blue and yellow flowers, girls are lining the path of the hero with more garlands, and the banners of the ships in the harbor are flying gaily, relieved against a blue sky. It is a day of sunshine and joy, a day of hope and trust, a day of deepest import in the history of Sweden, because it signifies the accomplishment of the outer liberation of the nation. Shortly afterwards Gustavus Vasa was crowned and began the foundation of modern Sweden in every department. Carl Larsson has treated the subject with the right feeling for simple grandeur and festivity; he has given us an imaginative picture from the history of Sweden which evokes noble feelings in the hearts of his countrymen.

Any account of Carl Larsson as a painter would be very incomplete without a word about his ability as a painter of the home. He has made an almost infinite number of water-colors with subjects taken from his own home or from the life of his and other persons' children, so that it has been said that Carl Larsson, like Kronos, lives upon his children! But a more amiable way to live on children than Carl Larsson's can scarcely be imagined. He has a very rare and valuable freshness, directness and naiveté in his observation of children which enables him to express their real life and character; all his pictures with children are true stories without any sentimentality or embellishment. And then there is always in Carl Larsson's stories that basic quality of profound love for the small models; it can be safely said that he is known over the whole of Sweden as the greatest lover of children who ever painted.

This very peculiar and significant position he has reached mostly through his books, in which he has collected several series of water-colors with children and the home life as motives, explaining them in a text full of genuine humor. The best known of the books are *Ett hem* (A Home), *Larssons*, and *Spadarfvet* (the place in Dalecarlia where he lives). Some of these or other color reproductions of Carl Larsson's pictures are now to be seen everywhere in Sweden, and they have brought joy and sunshine and happy thoughts into many homes, for they all carry with them something of that unexplainable life which is constantly radiating from the heart of this true artist.

Wherever he steps in there comes a ray of bright sunshine into the circle, and the dark powers, dullness, envy, hate, and other destroying passions, which are so common among modern artists, have no longer any chance. That is something Carl Larsson brings about, so to speak, almost unconsciously. It is a natural instinct in him to turn everything possible to sunshine, and he acts always independently, true to his own heart. It is therefore very natural that he should gradually have become more and more interested in Theosophy and the Râja Yoga work among children, for his whole nature has been prepared for a right understanding of the inner value of that glorious work.

OSVALD SIRÉN, PH. D.

Stockholm, December 1908.

The Women of Ireland

(THE following paper was read at the International Congress held at Brighton in the autumn of 1899, by Mrs. Annie P. Dick, since that time passed from the scene of her heart's chosen work, Theosophy. It is printed partly in tribute to one whom all could know but to love, whose innate kindness was only matched by her sternly simple adherence to the highest principles of life and thought. One of the pioneer Theosophical workers of Ireland, ever united in this work with her husband, so well known as editor of the *International Theosophist*, Mrs. Dick left an unfilled place behind her when she came to Lomaland, some years ago, to make her home here. When the summons came she accepted it, as any other call to duty would have been accepted, and her death crowned, like a benediction, a devoted and heroic life. To those who knew and loved her the following has a special interest; while to all who know of Katherine Tingley's work in Ireland it will convey much beyond what is conveyed in the literal text.)

IN few countries are women situated as are the women of Ireland, for Ireland has suffered much in the past from national and religious difficulties, and is suffering still. The results, the traces of this, are most discernible in its schools and colleges, where education tends to stifle, to bind their naturally beautiful and gifted natures.

The colleges for women are not noted for their broad, progressive system of education, and it is not surprising to find the women somewhat behind the times in the broader views of life which round the nature into independent types of womanhood.

Sometimes one finds a difficulty in knowing exactly how this came about. The colleges and schools in the cities, and here and there throughout the country, are much the same as colleges in other countries, as regards learning. It is not on the surface, as a rule, that one can trace the deteriorating influence. There seems to be a subtle tendency to bind, to narrow, even while the ordinary present-day teaching is given. The true nature is cramped, covered up, shut in by what it receives, and the result is that one is impressed, in many cases, by the bright intelligence and the fine

natures of women—but it is out of reach, it is surrounded by barriers, consisting of the subtle binding atmosphere, which gravitates and accentuates all the narrowing tendencies of the sect and set to which they belong. In this way a subtle disintegrating force is constantly at work, resulting in the many individual and party strifes, which makes united work for a common cause well-nigh impossible.

But all this is not natural to the Irish nature. We know that in ancient times people from all countries were welcomed to Erin's shores, to share the wisdom and learning of its sons and daughters. That universal wel-

LIGHT

BE not much troubled about many things,
 Fear often hath no whit of substance in it,
 And lives but just a minute;
 While from the very snow the wheat-blade springs.
 And light is like a flower,
 That bursts in full leaf from the darkest hour.
 And He who made the night,
 Made, too, the flowery sweetness of the light.
 Be it thy task, through His good grace, to win it.

Alice Cary

come could only have arisen from a united people, from united hearts.

And that unity is present today. Even through all that tends to stifle it, it rises pure and strong in their love of nature—in their keen perceptive appreciation of the beautiful, which flows so readily into poetry and song.

In beauty and grandeur American women possess what the Irish women lack. They can work harmoniously together for a common cause. They act from their woman's nature, free and untrammelled. They are leading the way, showing what women can and should be. If the women of Ireland follow, then surely the soul of Erin will be free.

ANNIE P. DICK

The New Magna Charta for Children

IN the excellent Act of Parliament for the protection of the young, which comes into force in April, England has made a great step in advance which will be particularly welcomed by all right-minded women. This step is the direct outcome of the growing perception that Brotherhood is a fact that can no longer be ignored or denied. The realization of the Universal Brotherhood of humanity may not have passed much beyond the material plane, except in the hearts and minds of a few here and there, lovers of humanity and—mystics, but it is a hopeful sign that nations are placing upon their statute-books proofs that they are awaking to the fact that what affects one unit affects all.

Sanitary regulation, compulsory education, and a few measures for the protection of children against the grossest abuses, such as the scandals of child-labor, have been enforced in England for many years—all tacit admissions of some sense of Brotherhood and responsibility; but the new law most definitely asserts the claim of the children, even of the poorest, to be an integral and valuable portion of the national life, no longer to be treated as "just somebody else's." It gives promise that a still deeper comprehension of Brotherhood is coming, impelled by the New Force that has arrived, whose sweeping tides are being felt in many ways, in places even by greater unrest, by more frenzied struggles for sensation—experience of "pleasure" and pain.

Cynics ask if legislation can cure the crying evils of the world. Perhaps not; but wise laws supported by public opinion can prevent their propagation. The Children's Act releases thousands of imperiled children from dangerous and horrible surroundings and gives them a better start in life.

By the compulsory nature of the Act the British people affirm that the State, for its own protection, has the right to take away and educate the children of parents who are gross-

ly and unmistakably unfitted to train them to be good citizens. Such parents are usually supposed to be of the poorer classes; but how many children will be left to be ruined by selfish, criminal or incompetent parents of the higher classes? How long will it be before the duties and rights of parentage will be regarded as a most sacred responsibility, requiring training and self-sacrifice? Katherine Tingley has truly pointed out that if the homes were as they should be—radiating centers of pure life—there would be little need for Râja Yoga schools. Râja Yoga education is the stepping-stone to a higher form of home-life, in which the young will find a sweet and clean atmosphere from the first moment of their lives.

What are the drastic improvements enforced by this Children's Act?

In the protection of life penalties will be the consequence of neglect to protect infants from the fatal open fire-grates used in England, a danger hardly realized in this country; and the "overlaying" or smothering of babies by parents in drunken stupor—a terribly frequent "accident"—becomes a crime. "Baby-farms" are to be properly regulated and inspected. The moral surroundings of older children are to be better guarded in many ways; no one under sixteen, for instance, is allowed to dwell in or frequent houses of questionable character. To protect against that most deplorable of all calamities, the formation of early habits of dissipation, no child under five may be given alcohol, and all children under fourteen are debarred from entering drinking saloons. The latter clause, which is generally considered very revolutionary, was added by the House of Lords! Cigarettes may not be sold to nor smoked in public by boys under sixteen.

Penal servitude for young people is practically abolished, and Juvenile Courts are to be established—an admirable reform which has begun none too soon in this country.

Space will not permit the mention of more of the excellent provisions of this Act, which covers 88 pages. One or two clauses alone are expected to affect over 30,000 children forthwith! What a picture of the dark side of our false civilization such protective regulations bring before us! How little have the teachings of Christ been heeded by his nominal followers—of Christ who said "Suffer little children to come unto me." STUDENT

AS our planet revolves once every year around the sun and at the same time turns in every twenty-four hours upon its own axis, thus traversing minor cycles within a larger one, so is the work of the smaller cyclic periods accomplished and recommenced, within the Great Saros. . . .

Thus we see in history a regular alternation of ebb and flow in the tide of human progress. The great kingdoms and empires of the world, after reaching the culmination of their greatness, descend again, in accordance with the same law by which they ascended; till, having reached the lowest point, humanity reasserts itself and mounts up once more, the height of its attainment being, by this law of ascending progression by cycles, somewhat higher than the point from which it had before descended. (H. P. Blavatsky, in *Isis Unveiled*, Vol. I, p. 34.)

Justice

THERE is nothing more merciful, nothing more beneficent than the principle of justice, which runs throughout the universe. It makes man the arbiter of his own destiny, and is his guarantee of final attainment. If it did not, there would be chaos.

To the personal man, until he is self-mastered, it brings varying fortunes, good and bad. But it alone can pave the way to lasting good; and to the eternal man, it is bound up with the peace which he possesses.

No one who pauses to think deeply can conceive of a universe that is not so guided, or really wish for an instant to be himself exempt from this great law.

The confusion of mind in regard to it has been a natural result of the loss of knowledge regarding the fact of Reincarnation. Not seeing in any one life the causes which have pro-

Joan of Arc

THE following is from one of the best and simplest accounts of Joan of Arc, Maid of Orleans. Can we, with the world perishing for inspiring ideals, afford *not* to accentuate her life and work whenever possible? STUDENT

In this critical period for France (1428), Joan of Arc appeared on the stage, being then a girl of 16 (some say 18) years of age. Although Joan was uneducated, she yet clearly comprehended the critical condition of her country and resolved to deliver France. She knew nothing of war; she had not been accustomed to equestrian exercises, like a woman of chivalry; she had no friends; she had never seen great people; she was poor and unimportant. To the eye of worldly wisdom her resolution was perfectly absurd.

It was with the greatest difficulty that Joan finally obtained an interview with Baudricourt, the governor of Vaucouleurs; and he laughed at her, and bade her uncle take her home and chastise her for pre-

COSTUMES OF THE SIXTEENTH CENTURY

duced all the present conditions, the majority have been ready to declare there were no causes. Or what is equally foolish, to attribute them to the unexplainable but arbitrary decisions of a personal God. Such childish conceptions have certainly retarded evolution. When the old forgotten truth of Reincarnation becomes once more a living factor in human life, there will be a new dignity, and new power which will come with it. One life bears an analogy to one day, closed on each side by a night of unconsciousness on the daily plane; but every day is related to all the days which have preceded, and which will follow. Should we forget the connexion, it nevertheless continues to exist, just the same. So it is with our lives. They are bound together by an unbroken thread. We come into life with certain characters which have been formed by us under the law of rigid justice. And during life, under the same law, they are being modified, molded anew. According to our characters we weave our destinies, though we may seem to be the mere toys of fate—until the soul stands at the helm and nobly guides the life to its greatness. STUDENT

sumption. She returned to her humble home, but with resolution unabated. The voices encouraged her, and the common people believed in her. Again, in the red coarse dress of a peasant girl, she sought the governor, claiming that God had sent her. There was something so strange, so persistent, so honest about her that he reported her case to the king. Meanwhile, the Duke of Lorraine heard of her, and sent her a safe-conduct, and the people of Vaucouleurs came forward and helped her. They gave her a horse and the dress of a soldier; and the governor, yielding to her urgency, furnished her with a sword and a letter to the king. She left without seeing her parents—which was one of the subsequent charges against her—and prosecuted her journey amid great perils and fatigues, traveling by night and with her four armed attendants.

After twelve days Joan reached Chinon, where the king was tarrying. But here new difficulties arose: she could not get an interview with the king; it was opposed by his most influential ministers and courtiers. "Why waste precious time," said they, "when Orleans is in the utmost peril, to give attention to a mad peasant girl who, if not mad, must be possessed with a devil, a sorceress to be avoided; what can she do for France?" The archbishop of Rheims, the prime minister of Charles, especially was against her. The learned doctors of the schools derided her claims. But the women of the court spoke warmly in Joan's favor, for her conduct was modest and irreproachable; and after two days she was admitted.—John Lord, in *Great Women*

OUR YOUNG FOLK

An Archway in Pompeii

THE ruined city of Pompeii, lying close to the volcano, Vesuvius, which wrought its destruction, still holds its weird fascination for the traveler in that vicinity.

Columns, arches and gateways are still standing, bare of the beauty of ornamentation, and houses all unroofed but still paved with mosaics of bright stone in intricate pattern, while the frescoes upon many walls are yet bright with colors and perfect in design.

Many of the houses were built around a court wherein fountains played and flowers bloomed. Life must have been full of pleasure in that warm, sunny country. Perhaps this pleasure had naught of the higher life about it to keep it pure and became degraded and evil, so that Nature's only remedy was to put it out of existence. Anyway it was in 79 A.D. that all of a sudden, without any warning, the mountain belched forth smoke and ashes and buried the city and for many centuries no one ever knew that there was a city there.

As excavations still continue, many interesting discoveries are being made. EUGENIA

A Pupil of the Heroes

PAUL had been reading tales of the old heroes of Greece and Rome and he was thinking all the time about their wonderful devotion to duty. There was Leonidas with his brave Spartans keeping the pass, and Horatius on the bridge; how fine they were!

"Have you swept up the yard?" asked a voice sharply, "you had better hasten or you will be late for school." Paul came out of his dreamland and took up the broom. He swept carefully, for he felt however great or small his work he must do it like a hero.

Paul was an orphan working on a small farm outside of school hours, and that for several years had been all he knew of home. What with the pigs to feed and the fowls to water, and the cows to bring to and fro for milking he had not much leisure. At first it dreary work; but by and by his heart awoke and he tended the dumb animals as friends—the only friends he had. He was too shy to make friends quickly, and indeed he had little opportunity to mix with his schoolmates. But Paul had learned the joys of reading and in good books he had found a new world of heroes. How he loved the stories of the Gods, and the ancient Greeks. If he could but have lived in those times! he thought.

One day when he was digging near the fence two tourists passing asked him for some water. Paul quickly ran to get it and when

AN ARCHWAY IN POMPEII

BUILD on resolve, and not upon regret,
The structure of thy future. Do not grope
Among the shadows of old sins, but let
Thine own soul's light shine on the path of hope,
And dissipate the darkness. Waste no tears
Upon the blotted record of lost years,
But turn the leaves and smile, oh, smile to see
The fair white pages that remain for thee.

Selected

he returned the men were so deep in discussion that they did not notice him.

"Lived before," said one, "of course we have. How is it possible to have developed such wonderful faculties and powers without? Only one miserable little earth life? Impossible! Take Jones, he is a born artist. He never studied figure in his life, and at the first art life class an expert asked him at what school he had studied. 'Innate ideas'—well, innate ideas must have a cause! Why we should object to so commonsense a method of progression surprises me." Turning he saw Paul and took the water from him.

"It is an interesting theory," replied the other man. The artist shrugged his shoulders and the subject dropped; besides, he was watching Paul. "The very embodiment of an ancient Greek," he thought, and he dropped back into his pocket the coin he had intended to give Paul and rummaged in his knapsack.

"Thanks so much," he said cordially, "perhaps you would like this paper to read," handing him a copy of the CENTURY PATH; and they shook hands. Paul's eyes met his with a

new light; he felt that he had found a friend. Then the tourists went on their way, the artist strangely silent and preoccupied.

Paul took his treasure to bed with him, and sitting up by candle-light in his little attic room, he read for the first time the wonderful teachings of Theosophy. How his hungry soul drank in the living truths. "A life without an ending, measureless in possibility opened up before him stretching both ways," as he told himself, "backwards and forwards." He vowed to dedicate himself forever to the higher, nobler, heroic life. From constant use the CENTURY PATH was worn to tatters; but the germ planted in the heart of the boy blossomed into life; his eyes grew brighter and his step firmer as he resolutely performed his simple duties.

An Ancient Greek: It was the picture of the year. A youth clad in a white tunic with a wreath of laurel crowning the nobly poised head and a look of calm, resolute strength in the steadfast eyes: a veritable hero.

Paul had given shape to his ideals and the spirit of the heroic age of Greece looked down upon the people from the walls of a modern Art Gallery, waking echoes in their hearts of the Golden Age when men knew themselves to be divine.

As they sat together in their studio, the genial artist we have known as a tourist, beamed upon Paul. It was the *magnum opus* of "his boy." "Son of my heart," he said, "to think the world might have missed that picture!" And as the young man answered him his face was as the face of his Greek ideal.

"Well may we rejoice together, my more than father. When you came as liberator to the poor boy, you freed more than a body. The gratitude born of your sympathy called into action the hidden powers of the soul; these justified the following of the artist's calling in a life dedicated to the service of others. The future is full of promise; for the true artist has many talents to lay out in the work of uplifting humanity." E. I. W.

In the mind that has been corrected and purged there is nothing unhealthy, impure, or unsound. Fate can never catch such a one with his life incomplete, like an actor who quits the stage before the play is finished.

REASON teaches us what it is to die, and that if one considers death by itself, separating it in thought from its imaginary terrors, it will be understood to be a work of nature, and nothing else. But to dread what is natural is childish.—*Marcus Aurelius*

THE CHILDREN'S HOUR

Lomaland Photo. and Engraving Dept.

A LOTUS GROUP AT MALMÖ, SWEDEN

Children of Long Ago

DID you ever wonder what little children played at, thousands of years ago. We are quite sure that they had not the elaborate costly toys and the wonderful mechanical contrivances that modern children have so many of; but some day when you travel in Europe and visit museums containing collections of old Egyptian, Assyrian or Greek curios, you will occasionally come upon a funny stiff dolly or a baby rattle that has been unearthed from some ancient city and that delighted some happy little baby in the olden times.

We know that little children in Greece rolled hoops and played ball, and so surely they must have known about skipping rope too.

In old Greek poems and plays we sometimes get beautiful little glimpses of what children played. We hear of games of skill, of quickness, of strength, of endurance, of fun and of chance just as we have them today. Hopping games were popular and so were games in a ring with one in the center something like our Fox and Goose, Many, Many Stars, and Ring-Around-a-Rosy. Little girls played a game with five tiny balls or round pebbles which they would toss into the air and try to catch between the fingers or on the back of the hand as we have seen children do with glass marbles or jack-stones.

One game the little folk had was like our game of Blind-Man's-Buff. We all have heard the story of Polyphemus, the one-eyed giant who shut Odysseus and his ship's crew of Greeks into his cave and was devouring them one by one until they succeeded in putting out his eye and making their escape from his cave and from the Island of the Cyclopes.

DEEDS OF KINDNESS

SUPPOSE the little cowslip
Should hang its little cup,
And say, "I'm such a tiny flower,
I'd better not grow up."
How many a weary traveler
Would miss its fragrant smell!
How many a little child would grieve
To lose it from the dell!

Suppose the glistening dew-drops
Upon the grass should say,
"What can a little dew-drop do?
I'd better roll away."
The blade on which it rested,
Before the day was done,
Without a drop to moisten it
Would wither in the sun.

Suppose the little breezes,
Upon a summer's day,
Should think themselves too small to cool
The traveler on his way;
Who would not miss the smallest
And softest ones that blow,
And think they make a great mistake
If they were talking so?

How many deeds of kindness
A little child may do,
Although it has so little strength,
A little wisdom too!
It needs a loving spirit,
Much more than strength, to prove,
How many things a child may do
For others by its love.

Lucy Larcom (Selected)

In the game, the blindfolded child was Polyphemus and those he was groping about trying to catch were the Greeks.

The children of Greece had no story books, as there were no printing presses in those

days; but even in the nursery they were taught the myths, the stories about the Gods and the deeds of the heroes.

In Greece one is scarcely ever out of sight of the sea or some inlet, so the children of Hellas, as Greece was called in olden times, must have had picnics on the beach where they built castles in the sand, picked up shells and sea-weed, and raced with the waves just as do the children of Lomaland today. Perhaps no children since the Greeks have felt so close to nature as do the little Râja Yogas of Lomaland, and it is not surprising to them that the children of ancient Hellas saw a dryad in every tree, nymphs in the mountain dales, naiads in the fountains and streams, and nereids in the sea.

The Grecian Isles are more like Point Loma than any other place in the world. You can see it in the coloring of water and sky, the dawn and sunset, the dusty roads in summer and the brown hills that become so green and flower-covered in spring, the gray olive trees, the pine, the palm, pepper and acacia. The sacred way that leads from Athens to the ruined Temple of Demeter in Eleusis where the Mysteries were taught, is very much like the drive from San Diego around the bay to Lomaland.

L.

He that always complains is never pitied.
— *Proverb*

THE strongest things are in danger from the weakest.— *Rossetti*

THE blue in the heavens is larger than the cloud.— *Browning*

AFTER all, it is not what is around us, but what is in us: not what we have, but what we are, that makes us happy.— *Geikie*

Science Discovers What the Soul Is

ALL serious thinkers must have observed that certain minds peculiarly fitted for work within the strict limits of scientific observation have a curious deficiency in the logical sense, which is manifested when they try to work outside their sphere. One of the ways in which it manifests itself is in the notion that *something can develop from nothing*. In order to explain away the doctrine of a sublime origin of man, they argue that all the wonderful faculties which he has, have "developed." To a logical mind it seems as if their argument proved their opponents' case; for how can anything develop unless it has previously existed in the potential form? To a logical mind it seems as if the fact that an oak can grow out of an acorn is proof that every quality of the oak was present in the acorn; and as if the fact that man can "develop" intellect and other high powers was proof that all these powers must have pre-existed in some form. But the kind of mind we are considering reasons otherwise.

As an example, take an actual case of a man who argues that the soul is *not* something innate, *but* something that has developed. This is like arguing that the oak is not something innate in the acorn, but something that has developed from it. Logical minds will wonder what the point of the argument is. It will seem to them as though the fact that the soul has developed is proof that it was innate. Yet a scientist has propounded the above argument, and it is hailed by another scientist, who reviews him, as an instance of the marvelous light which science sheds on the problems of life!

In an article in the *Daily Chronicle* (London, Oct. 27th), under the title, "What is a Soul," an enthusiastic reviewer reviews the work of a scientific writer. From the writer he quotes the following:

The existence of the "soul" is not denied or even doubted. Far from it. What is asserted is that this "soul" attribute of man is either an inborn tendency or a subsequent acquirement based on such. If the latter, it must develop in response to its own specific stimuli of nutrition, use and injury. As a human possession, it must follow the same laws in accordance with which other human attributes also appear and grow. . . . The term

represents to the majority of people a something that man possesses, one of his characteristics. But—the question arises: How does a soul develop, and what is its origin?

He derides the idea that every infant comes into the world with a perfectly developed soul;

the infant has no moral sense and scarcely any mind. The soul is an *attribute* of man, which develops and can degenerate. As an example of confusion of thought the following is worthy of notice:

If every human being has within him the innate capacity to develop a "soul," it will depend largely upon his environment after birth whether and to what extent that capacity is utilized. In other words a "soul" is not born but made. It is no more born than mind is born. Both are acquired, even if we suppose they are independent.

What, it will be asked, is this "innate capacity to develop a soul"? Surely that capacity is something? And it must necessarily be superior to the soul since it is capable of generating the soul. So the writer, in the act of explaining away the pre-natal soul, readmits it; he bows it out at one door and it comes in behind his back at another. It does not seem to strike the writer that in postulating an innate capacity to develop a soul, he gives away the whole case for which he is arguing.

Further perusal of the review and quotations shows us that the "soul" about which they are talking is simply the *character* of the man; and indeed that is exactly what the reviewer himself calls it lower down, though he gives it a capital initial.

The reviewer begins by remarking the way in which science has quietly invaded the moral sphere, and the political sphere. This, he thinks, is a most welcome circumstance, as both of these spheres need help and regeneration and science is the thing to do it.

Strange is it to think that humanity suffers itself to be buffeted and distracted by two forces as ignorant of terrestrial life as itself, while near at hand, doing so much for the happiness and comfort of mankind, definite knowledge walks steadfastly the road of peace.

Lower Manas Vaunting Itself as Buddhi

The context precludes the idea that the above is a piece of irony; it seems evident the writer really believes it. One might suggest, as a possible solution to the above question, that perhaps religion and politics are too blind to see the things which science is doing for the happiness of mankind. But to continue. The book reviewed treats the soul of man, it seems, "as something physical." "The beginning of the matter lies in clear thinking concerning the soul."

Science herself once thought so loosely about the soul as to deny its existence. But now that she has reformed herself in this respect, she seeks in an admirable spirit of reverent and determined inquiry to ascertain all that is knowable of this entity.

And the result of this modest aspiration is

the triumphant discovery that the soul is only the character! The immortality of the soul is the immortality of the character, we are further told; and the man who has just denied that an infant is born with a soul speculates about the immortality of the soul, which, as he says, the infant has developed. The wonderful scientific discovery fades away like a halo in the mist; and the poor despised politicians and theologians will be wondering just what it is that science has discovered about the soul after all.

**Soul, now having
no Independent
Existence,
becomes
Scientifically
Acceptable**

But how is it possible to explain things to such a mind? The Theosophical argument is that the existence in man of wonderful faculties which are always developing is proof of the existence of some sublime source from which all this energy and fecundity proceeds. But to the mind described this, probably, will be no argument at all. That mind apparently reasons that the existence of all these developing faculties is proof that there is *no* such source. To a Theosophist the fact of the growth of a plant points to the existence of a seed; to the other class of mind, it points to the *non-existence* of a seed. So our arguments are wasted.

Theosophy defines the Soul as that source which is superior to all the faculties that go to make up a man's personality; the real *Self* behind the false self; the Knower behind the speculating doubting mind; the Will behind the inconstant desires; the Divine Love behind the vain and foolish emotions; the real liver of the life behind the futile aims of ambition. If there is not this real Man behind all the outer phantasmagoria, then all life is a bedlam and all argument is foolishness. The fact of our reflective, self-examining consciousness, proves the existence of this independent factor; or, at the very least, it must be postulated as a necessary axiom preliminary to all reasoning on the question at all.

The word "soul" is also used in Theosophy (usually without the capital initial) to denote the totality of the personal—or lower—consciousness; and in this sense it seems to be identical with the soul described by the writers quoted. But this soul is not immortal; changes during life alter it; the change of death practically disintegrates it altogether. The immortal Soul remains, and develops for itself a new personal soul in the next earthly life.

STUDENT

Reflex Action

AN article which one sees in a scientific contemporary, under the promising title of "The Mechanism of the Human Brain," scarcely fulfils that promise; nor does it answer the expectation aroused by its subtitle, "The Laws that Govern Psychic Phenomena" (the word "psychic" here having no reference to occult powers, but merely meaning "pertaining to the mind or soul"). For, in place of learning anything about the mechanism of the brain or the laws that govern the operations of mind, we have an account of a few experiments in reflex action.

It is announced that recent studies have resulted in the discovery that the law of cause and effect rules as inexorably in the domain

of these phenomena as in that of physical phenomena; but all people of sound mind must have previously accepted that conclusion *a priori* in the absence of any other conceivable alternative. If the law of cause and effect does not rule, what does? So this discovery does not amount to much. As an example, is given the fact that the pupil of the eye contracts under the stimulus of light; and the inexorability of the law of cause and effect is held to be proved in this case by certain experiments which were made with apparatus for flashing light into the eye and registering the exact results in the case of sane people, insane people, and other kinds of people. Next, come similar experiments for registering in a diagram on paper the amount and kind of kicking which a leg will give when the nerves near the knee are touched. By this means a series of curves is obtained, which may be found useful in ascertaining whether a person is sane or not.

This kind of thing may be interesting, but is hardly a description of the mechanism of the brain or the laws of mind. Let us try to illuminate the subject with a few thoughts on this question of "reflex action."

It is customary to draw a distinction between conscious response to a stimulus and unconscious response, the latter being called reflex action. But such a distinction is not valid. In the former case, the sensation is supposed to travel up the nerves to the brain, where it sets in motion some mechanism in the brain cells which sends back a motor impulse along the motor nerves; and the phenomenon of consciousness, including thought, volition, etc., is supposed to be, as it were, an accompaniment of the brain action. (One must apologize for the obscurity but may disclaim all responsibility for it.) Other theorists may vary this explanation by saying that the impulse passes from the brain cells to the mind, and from the mind back to the brain cells—which is certainly an improvement on the former explanation. But in the case of reflex action, the mind is supposed not to intervene at all, the cells (in this case usually those of the spinal centers) carrying on all the work themselves. As a fact, it is as necessary to suppose the existence of mind in one case as the other, for no merely mechanical explanation can suffice. The difference between the two cases is that, in the former case, that part of our mental equipment known as the *attention* is focussed on the mental action, and in the other case it is not. Hence in the latter case the process seems to be unconscious. But it is possible that mental action may go on in our own organism without our being aware of it, as indeed some psychologists admit, using the term "subconscious." It is these subconscious elements of our mind that manage all those functions which are called automatic or reflex. For our body is actually a congeries of animals (as it were) performing their various functions in subordination to the governing life of the whole. All of these animal functions received their education and development in the lower kingdoms of nature, when they did not form a part of the human structure. In the building of man's body, the growing germ absorbs these little lives from Nature's storehouse. Now they run, as it were, like skilled workmen, without supervision from the master. Nevertheless they are conscious and

have mind (such as it is), instincts, tastes, and so on.

When we walk, we do not consciously direct the various muscular movements, but issue an order to the foreman of that department, who executes it forthwith. We place food within the body, and the digestive management, with its various sub-departments, takes charge. In many actions, the conscious mind interferes, rendering the action more variable and complicated. In short, the various grades of consciousness that go to make up the whole complex life of man are legion, and their study is a work demanding time and patience. But before details are investigated, it is necessary that one should study the broad outlines, such as are given in text-books on Theosophy. These will be found of far more service than the conjectures and speculations of all and sundry.

STUDENT

Airship Controlled from the Land

AN inventor has exhibited a working model of an airship whose driving and steering mechanism is controlled by electric induction transmitted from a fixed land station as in wireless telegraphy. The model was a cigar-shaped gas-bag 22 feet in length, inflated with hydrogen, beneath which was suspended the framework carrying the mechanism and motors. The demonstration took place in a balloon shed some 600 or 700 feet long. The operator actuates a key-board which governs the transmitting discharges; and he could make the airship maneuver back and forth or up and down, at will. The vessel has a propeller and rudder, another propeller underneath to raise and lower it, and even a mechanism for dropping—food for sufferers? bibles for the heathen?—no, bombs!

The inventor claimed to be able with that apparatus to control the vessel at 12 or 15 miles, and to extend that distance indefinitely with more powerful apparatus. The receiving wire stretches over the gas bag, and it is proposed to use compressed air motors instead of the inflammable gasoline. Patents have been taken out. The inventor thinks his model would stand a poor chance in a gale.

It is a pity that war is the only theme on which the speculative mind seems able to dwell; one could suggest several useful and beneficent applications. But doubtless the enemy will soon discover means of manipulating the hostile ship from his own station. The invention promises to reduce the weight carried by transferring some of the apparatus to the earth—including the aeronauts themselves. But we have still the same difficulties arising from the necessity of making the vessel at once light enough to sail and massive enough to withstand the wind. If the secret of overcoming, or reversing, gravitational pull could be found out, then we should have a vessel which would possess mass but not weight, and the problem would be solved. T.

Oxybenzylmethyleneglycol Anhydride

THE above is not a Sanskrit term used in Theosophy; Theosophists are not allowed to use words a quarter that length for fear of frightening the public. But electricians may use the above for insulating wires, and musicians may use six different languages on the same concert program. Yet Theosophy is expected to get along without technical terms! E.

Some Views on XXth Century Problems

The Lessons of Anaesthesia

SCIENCE does not seem to have seen very far into the significance of certain phenomena sometimes produced by anaesthetics. The tortuous byways of hypnotism are more attractive than the study of facts that already lie at the door.

The record begins with the experience recorded of himself by Sir Humphry Davy, occurring during the action of nitrous oxide gas. It seemed to him that "Nothing exists but thought. The Universe is composed of impressions, ideas, pleasures, and pains."

Another patient, quoted by Professor Jastrow, said: "When under chloroform, the Platonic ideas came to me that Matter was only phenomenal, while the only reality was that which underlay Matter—viz., its spiritual substance."

Sir William Ramsay's experience was similar: "An overwhelming impression fixed itself upon me that the state in which I then was, was reality; that now I had reached the true solution of the secret of the universe, in understanding the secret of my own mind; that all outside objects were merely passing reflections on the eternal mirror of my mind." He found that he could recall his ordinary waking life, but it seemed utterly unimportant. "The main and impressive fact for me was that I was self-existent, and that time and space were illusions. This was the real *Ego*, on whose surface ripples of incident arose, to fade and vanish like the waves on a pond."

Mr. J. A. Symonds, also quoted by Professor Jastrow, said: "I thought that I was near death, when suddenly my soul became aware of God, who was manifestly dealing with me, handling me, so to speak, in an intense personal reality. I felt Him streaming in like light upon me, and heard Him saying in no language, but as hands touch hands and communicate sensations, 'I led thee, I guided thee; you will never sin and weep and wail in madness any more; for now you have seen Me.' My whole consciousness was brought to one point of absolute conviction; the independence of my mind from my body was proved by the phenomena of this acute sensibility to spiritual facts; Life and Death seemed mere names."

Dr. Holmes said: "The veil of eternity was lifted. The one great truth, that which underlies all human experience, and is the key to all the mysteries that philosophy has tried in vain to solve, flashed upon me in a sudden revelation."

Professor James, summarizing other cases, speaks of the

intense metaphysical illumination. Truth lies open to the view in depth beneath depth of almost blinding evidence. The mind sees all the logical relations of being with an apparent subtlety and instantaneity to which its normal consciousness offers no parallel; only, as sobriety returns, the feeling of insight fades, and one is left staring vacantly at a few disjointed words and phrases.

One of his correspondents told him that, "At the acutest point I saw. I understood for a moment things that I have now forgot-

ten,—things that no one could remember while retaining sanity."

All these experiences are inexplicable unless man is viewed as dual, as a soul incarnate in an animal body. An animal is, from one point of view, only a receiver of sensations, of percepts, and a reactor to them by motions. The sensations, and their memories and anticipations, their interconnexion and elaboration, finally, in the higher animals, constitute the working of their mind. In man this mind is carried to its highest terms, but, standing alone, it is in close dependence upon the body and brain. Into this, spiritual man incarnates; in it the incarnating pole of him is, as it were, dissolved; so closely has he to touch material life. His own proper spiritual noetic consciousness is well-nigh lost in the stress of sensation; its workings becoming lost to his awareness in the far noisier workings of the material mind that fronts out to objective nature. But the anaesthetic, like death, stills the latter; and the man is once more self-conscious in the former and knows what he knows. The anaesthesia more or less excarnates him; its departure permits his reincarnation.

The process is, however, as a mode of illumination, of acquiring real knowledge, quite worthless. When the two minds, the temporarily excarnated one and the animal, once more come together, the former can in most cases impress the latter with nothing whatever. In men of some spirituality it can, as in the cases quoted, impress the latter—not with knowledge, but with the fact that knowledge *was*. And any gleams of knowledge that do survive the transit may be wholly misinterpreted, or forced into philosophic or religious frameworks made in advance by the brain mind or received from current religious teachings.

It is man's task to make a unit of his duad. He has to sublimate and spiritualize the stream of animal consciousness. If he could take an anaesthetic that lasted a million years, that permitted him to return for that time to the *outskirts* of his proper home, his task would await him at the end of it. He would have gained nothing at all. He has to "know matter," which is done by regaining his spiritual nature while in matter, by recognizing himself as spiritual against that clamor and resistance, thus spiritualizing the clamor itself back to the primeval harmony. "Knowing matter" does *not* mean plunging into matter yet further and sounding its experiences. We *are* so plunged, *are* facing the experiences. Voluntary plunges deeper, in response to any (always hypocritical) theory of their philosophic necessity, involve a more terrific risk than is easily realized.

Anaesthetics and narcotics are not the treading of the path by an inch. To some few natures they show that there *is* a path. The path is through the waking, sense-laden consciousness; trodden a little day by day by means of thought, meditation, aspiration; by that fixed doing of duty which the sense-consciousness may resent as an outrage upon its desire for comfort; by that compassion in thought and deed which the sense-consciousness resents as

a crucifixion of its selfishness. Whoever will tread this path steadily will, one day in the silence, find himself in presence of a far clearer light than anaesthetics could introduce him to; and however high he gets up he will bring back his memory with him to the fields of his common life.

STUDENT

A Pre-Sterilized Conference

THE missionaries of the Christian world are going to overhaul the whole situation and determine what to do about it. Next year they will hold a World Missionary Conference. "In connexion with the old and magnificent ideal of the universal preaching of the gospel," says one of the chief London dailies,

a moral crisis has been reached. Matters cannot remain as they stand. Failure must either be admitted or a new crusade undertaken. . . . Unless a new crusade is to go forth as a result of the proceedings in Edinburgh next year, final failure will have to be confessed. . . . What is the broad fact? After 2000 years, all sections of Christians put together, including the Roman Catholic and the Orthodox persuasions, are a small minority of the world's inhabitants. . . . More than a thousand millions of mankind . . . are still either merely non-Christian or profoundly anti-Christian. Now here is a stupendous fact to be faced. Upon the sheer prodigious mass of that fact hardly any impression has yet been made.

To this "prodigious mass" something has to be added. What of the rest, those remaining when the thousand million anti- and non-Christians have been considered? What of the *Christian* world? Suppose a company of undersized, undervitalized and anaemic persons decided to send out emissaries to preach physical culture according to methods which they were willing to warrant.

But the condition of the Christian world, it will be said, is due to its imperfect assimilation of Christianity. Granted; but is it then capable of emitting missionaries with any power behind them?

Christianity in its profounder sense is rather a *Light* than a body of doctrine, is it not? A *Light* which in its broader functioning, if it were allowed the chance of that, would integrate wider and wider areas of men into a perfect brotherhood. Only such a *perfected* organic brotherhood, grown to a certain size, is *capable*—almost biologically speaking—of producing seed that will fructify into its like wherever scattered. When the Christian world is well on in that direction it will find that it is acting inductively in every land and that missionaries are unnecessary. *Until* it is so, the seeds are sterile. And they are sterile for that reason. Work must begin at home and stay there for a long time yet. It is work only to be done by men who think of Christianity first as a *Light* illuminating life, making it comprehensible: rather than first as teachings. It must awaken latent divinity, or it is not Christianity. The putting of doctrines first, and the *Light* and the latent divinity second if anywhere, is why the Christian world needs Christianization—which is illumination of *mind* and heart. But illumination of mind is something very different from filling it with statements or even beliefs. C.

Archaeology Palaeontology Ethnology

Roman Tools and Surgical Instruments

ARCHAEOLOGY may be said to have initiated a new Renaissance of knowledge concerning classical times; for whereas the older Renaissance introduced us to the literature and art of the Greeks and Romans, so this later one is making us more familiar with their industrial and scientific attainments. Here again too, as in the former case, we find that they were our predecessors and teachers in many things in which we had supposed we held the claim to originality. A writer in the *English Mechanic* says:

It seems to be little realized how many modern tools have their prototypes dating from Roman times: the Reading museum contains, among other things, an iron plane which curiously corresponds to the modern American implement. . . . A visit to the Naples museum, especially the exhibits of early surgical appliances, causes one to forcibly realize that manufacture of instruments was in a much more advanced state than is usually supposed by the average individual: the screws are particularly worthy of notice.

It is probable that iron tools only survive under specially favorable conditions, and may have existed more plentifully and universally than archaeological research indicates.

We have only to think what would become of most of our manufactures after a few centuries under ground, and we shall realize that so far as evidence from finds is concerned, the Romans could have had most of the things which we have.

An article in the *Scientific American Supplement*, translated from *Die Umschau*, says that on visiting the Saalburg museum, the writer was impressed by the great number of surgical instruments there exhibited, and astonished by their practical construction; they were found in a well within the walls of the old Roman fortress, and are about 2000

years old. They are made of bronze and covered with a blue-green rust. The collection gives evidence of an advanced stage of surgical knowledge; it includes probes, delicate knives, and a laryngoscope; which last indicates that the Roman surgeons practised illumination of the mouth and probably of the throat and larynx. There is a small self-acting pair of pincers, as practical and efficient as the best modern examples.

The writer then resolved to investigate this subject in other collections; and found in the Berlin Antiquarium many antique probes, needles, and forceps, of practical and artistic design, a medicine chest with a beautifully carved lid, and a bronze casket containing probes and surgical spoons which was found in the tomb of a military surgeon in Servia.

Roman culture, however, was no more original than our own. It was derived wholly from Greece.

And the Greeks derived theirs from Crete, Asia Minor, and Egypt. Each successive civilization inherits the acquirements of its predecessors—or rather some of those acquirements—and each adds thereto something peculiar to itself; and so progress goes on. But, in comparing our own civilization with those that have gone before, we have to remember that it is still very young in years. Egyptian and Asian history, so far as we have any, will show gaps equal in length to the whole of our civilized period. What our civilization may eventually achieve we cannot yet say.

Lomeland Photo. and Engraving Dept.

STREET AND RUINED SHOPS, POMPEII

In the Naples National Museum is a collection of fifty instruments, from Pompeii, including various blunt and pointed probes, spoons, and hooks, a dilating forceps, a forceps for cutting and extracting bone, blistering cups, catheters, and two vaginal specula, one with three and the other with four blades.

But the beginnings of surgery must be sought for at a far earlier epoch. The Berlin anthropological Museum contains surgical instruments which were found in the ruins of Troy, or Ilion, and which consequently date from the period 1500 to 1100 B.C. These instruments are strikingly like those of Roman times. . . . A few surgical instruments, very similar to the less ancient specimens described above, have come down to us from the middle period of Egyptian history. Among them are probes of various forms, needles, forceps; universal implements in which pincers, knives and probes are combined; and a dissecting knife of a peculiar shape. STUDENT

Ruins of Sardes

IN the *National Geographic Magazine* for January, Ernest L. Harris, the U. S. Consul-General to Smyrna, continues his articles on "The Buried Cities of Asia Minor," and says, of Sardes:

There is considerable fable connected with the early people who located here, and beyond a surmise that they must have been tribes sprung from the great Indo-Germanic race of central Asia, nothing seems to be definitely known, not even the dates of their migrations. These early races were succeeded by the Lydians, a Semitic race which probably wandered in from Assyria. From all accounts the Lydians were extremely industrious, and the city of Sardes . . . became proverbial for its wealth and luxury. That the country-side about Sardes must have been very rich in ancient times, those who visit the place today see ample signs. . . .

In my judgment, Sardes would make an excellent place for excavations, as practically nothing has ever been done thus far to unearth any of its buildings. . . . I am fully satisfied that under all those Roman buildings which lie about the field, and are more or less buried in the soil which earthquakes and ruin have brought down from the castle hill, there are many Lydian and Greek monuments as old as the pillars of the Cybele temple and dating from the earliest times.

. . . The stranger who visits this spot today is almost overwhelmed by the contending thoughts which rush upon him. Where noble temples, the best products of an advanced civilization, once stood in all their glory, where an intellectual people once held sway, there stand today a few wretched mud huts occupied by still more wretched inhabitants. . . . The picture is too miserable to describe. . . . Sardes, the home of kings, the place where the priests performed their sacred rites, where wise men conferred, for the possession of which soldiers fought, is no more!

All of which helps to illustrate the great historical law that human progress is *cyclic*, made of successive ups and downs. For nothing in this outer world of appearances is permanent, but everything has its birth, youth, age and death.

Only the informing Spirit is eternal, as it passes on from form to form, ever lifting, ever causing new growth and rebirth. A nation is like a human body, a temporary shrine for a deathless Spirit. Thus the Souls that enacted their parts in those bygone dramas may now be learning new lessons, and how to build on a stabler basis, amid the experiences of contemporary life. STUDENT

Sahara Studded with Ruins

MR. Hanns Vischer, who has recently arrived in England from Tripoli, has made a journey of nearly 1700 miles across the desert, through the Hinterland, to Lake Chad. The whole region between Tripoli and Murzuk was studded with ruins of ancient towns, probably Roman. T.

✻ The Trend of Twentieth Century Science ✻

Exchanging Juices

THE animal serum craze runs on to its natural finality, doing so speculatively a little in advance of practically. If the juices of animals, poisoned and healthy, are good, why not those of men? If we can make people immune against diseases by giving them juices of animals previously infected with those diseases, and if old age is a disease, why cannot we make people immune against old age by giving them the juices of the variety of animal called man, previously affected with that disease—that is, of old persons?

A Bulgarian physician, Tranjen, makes this proposition. But he is fair about it; he will establish a benign circle. If his proposition reminds one of the islanders who lived by taking in each others' washing, that is not his concern. He will make young people immune against old age by inoculating them with infusions of the tissues of the old; and then he will use the serum of these thus immortalized youths to cure the senility of the first named old people. In this striking scheme of co-operation we may all become immortal. I mount on my grandfather's shoulders; he climbs upon mine; thus we finally reach the stars.

The human body has of course a time limit like every other aggregation in physical nature. Even a crystal is spending itself. But that time limit does not exactly reside in it but in that ideal matrix of ether—using the word widely—which is the reason of its persistence of general type through all changes of substance from moment to moment, year to year. When the mainspring of the matrix runs down, whether its period be one hundred and twenty or four hundred years, the body must dissolve.

But we die of our habits long before that. And in the absence of reform of human habits, any measures whatever can have but the most trifling effect. The best judged medicine does almost nothing unless the patient takes the opportunity of the redistribution of his forces to correct—even if only for the time—his ill habits. Diseases are the outcrop of bad habits; you can no more have the latter without the former than you can have one end of a stick without the other. You can but redistribute them in the interests of opportunity for reform. And the question of all good and bad habits winds up somewhere, somewhere, on the plane of ethics. STUDENT

Life and Electricity

A FULLER report of the experiments on the electricity of fruits has come to hand, summarized in the *Scientific American*. All fruits, so far as the investigation has gone, turn out to be electric storage batteries. More than that, they appear to be continuous self-generators till the moment when decomposition begins to set in. In some cases the actual seed, the germinative portion, seems to generate the negative; the encasement or pulp the positive. Thus the core of the apple has the one sign, the fleshy portion the other. But in the case of fruits like the

orange, with septa, the divisions are alternately negative and positive. The investigator, an English electrician, does not report how the seed here stands to the pulp.

The theory advanced does not work very well. The electric sign of the earth is negative and whatever grows out of it is at first negative too, the conducting electrolyte being the sap.

The leaves commence to burst forth, the buds becoming charged with the negative electricity from the earth through the electrolyte. As the leaf expands it also becomes charged inductively with positive electricity from the air, as likewise do the flowers. When the fruit commences to form, however, nature provides an impermeable insulator represented by the rind or peel enveloping the fleshy portion of the fruit, but at the same time the negative charging continues from the earth to the seed center or core through the stalk, this central negative cell being insulated from the positive fleshy cell by a thin skin.

That reads at first very well, and doubtless represents part of the case. But it does not account for the alternation of the sign in the septa of fruits; nor for the maintenance of the current after the fruit is separated from the tree till decomposition has set in.

Here is clearly something for the raw food propagandists. Whoever eats the pulp of an apple which has not been cut in two by a metal knife, nor cooked, is getting a dose of positive electricity. Whoever eats a walnut freshly cracked is getting one of negative. Whoever eats an orange, division after division, is getting the two alternately—if he has not punctured the divisions with a silver knife. It is evident, however, that cooking still leaves something, we do not know what, of a vital stimulating kind.

Someone may suggest that we can do just as well by momentarily touching a rubbed glass rod, stick of sealing wax, plate of resin, or other source of frictional electricity. But does it follow that because the two electricities, from the apple and from the sealing wax, will both cause the leaves of an electroscope to diverge there is no difference? They are identical—in so far as that; both are electricity. Some barium sulphide that has been exposed to the sun gives the same answers to chemical tests in the laboratory as some that has not; but wait until the night comes!

STUDENT

Orthodox Metallotherapy

AN eminent English surgeon has been summing up the now known possibilities of radium in the practice of his art. At first it was supposed to be able to do everything. Then, young as it is (for us), came a reaction. Now, in another reaction, a better judgment can be rendered. Apparently its work belongs to the surface, and it must be so used as to correspond to the surface it is to affect. That is, it must be applied on plates or pieces of silk that will cover the disease. A weak application, so used, does much better work than a stronger one concentrated in the bottom of a tube. Care must also be exercised in the duration of its application; and

the best work is done by a selection among its emanations. It emanates: (1) atoms, (2) electrons, (3) X-rays and ultra-violet light, (4) something which finally becomes helium. The first seem useless, and are apparently best cut off by an aluminium screen. If the third alone is desired, the second may be cut off by a quartz-glass plate. In France, regular prescriptions are written, giving area of application, time, and the quality of emanation desired.

Used thus skilfully, it will cure, said Sir Frederick Treves, every form of naevus, the port-wine stain, the hairy mole, and the pigment mole; blood tumors anywhere on the skin or eyelid; rodent ulcers; and often cancers of the skin. So far stands surgical knowledge.

But it is now known that *all* metals are radio-active, though in much less degree. Have they, when used for much longer periods, no such powers? Some twenty years ago we were hearing a good deal of "metallotherapy," the application of metals for the cure of disease. The thing was done in a very haphazard way; suggestion was shown to be answerable for many of the results; and an atmosphere of quackery collected about the whole matter. A little of the same has collected around the use of radium, and the public have hardly yet learned to avoid the radium quacks. But might not the doctors turn a little attention now to the possible powers of the emanations of externally applied metals? It is undenied that the wearing of a plate of copper protects against cholera. There is a popular "superstition" which will not away, that the rubbing of a sty by a bit of pure gold will abort or hasten it. Here are two little fragments to go on with. STUDENT

Another Danger Averted

ONE by one the terrors of coming extinction are lifted from our hearts, most recently the most recent of them. An official geological report examines the question of reservoirs of deep crustal water which are supposed to be enlarging so rapidly at the expense of our seas and lakes. The author of the report concludes that this deep water, if spread out as a sheet over the whole globe, would be less than a hundred feet thick. Even this may seem a good deal until we remember that if the oceans were spread similarly as a continuous sheet it would be 10,500 feet thick. So we breathe again and are willing to let the earth have her thin water cloak. She may however have none of it through parts of her crust, and exceedingly deep reservoirs scattered through other parts.

The purpose of this globe of ours, and of the system of which it is a fraction, is that human life may come to be and come to full evolution; and that plan proposes to realize itself. So we may answer the pessimists *a priori* on philosophical grounds, that even if they seem for a time to prove their case, it is because they and we have yet some new fact, or some ten million new facts to learn. The next may earthquake the theories. STUDENT

Life in North Carolina Mountains

ONE of the most primitive sections of our country is the wild and lovely mountain region of Western North Carolina. It extends from an extremely high plateau, from the "Blue Ridge" to the main chain of the Appalachians, which constitutes the western boundary of the State; it is divided by numerous cross ridges of magnificent elevation, and riven by a thousand streams into glens and valleys of surpassing beauty. This country was settled during the last years of the 18th Century by stalwart pioneers from Virginia and Pennsylvania, among whom one recalls the names of Daniel Boone, James Robinson, John Carter, and John Sevier. The inhabitants have clung all these years to their old homes at the heads of streams in accessible mountain fastnesses, and still maintain the customs and ways of living of their forefathers. Until the opening up of this country by recent mining and timber industries, they have been cut off from all contact with the outer world, and in the remote counties of Ashe, Watauga, Mitchell and Yancey, the visitor has a splendid opportunity to study many surviving conditions of colonial days. It is strange how this remnant should have been left, stranded in the high mountain valleys of the eastern United States, and almost untouched by the tide of modern progress which has swept westward over prairies and deserts to the Pacific Ocean.

The North Carolina mountaineer, though conservative, is a person of marked independence. He has never known what it is to conform to fashion either in manners or thought. It must be confessed that his independence often takes the form of lawlessness and many a difference in opinion has found vent in bloodshed and the formation of family feuds. He lives close to the soil, but however rough and uncouth his habits, he maintains a native dignity that compels our respect.

The log cabin is no longer the prevailing type of mountain home, but there are many still occupied, especially in the remoter districts, and nothing brings more clearly to mind the hard days of the early settler. The cabin is essentially a one-roomed structure, though it may be divided into two by a partition. It has a stone chimney built at one end on the outside; many sites of old dwellings are marked by a lonely pathetic chimney still standing, its black, cavernous fire-place bearing mute witness to a home long vanished. The poorer cabins have no windows at all, the door being the sole inlet for light and air; sometimes there is no floor save the hard packed earth; the steeply slanting roof projects out over a lean-to or shed, at one side, under which the family shelters its hay, corn and other rude supplies. Poor and rough as this dwelling is, it has its own unconscious harmony and beauty; it is a natural, though humble, flower of its environment; and it weathers the air of mystery and romance, of simple human dignity and sentiment which many a grander mansion does not possess.

Every house has, as its natural corollaries, first a spring, with a covered wooden trough built near it, through which the water flows and cools the jars of milk and butter; then an apple orchard, a hay stack or so, a corn field, and very often on the high hill-sides, a patch of buckwheat. Within doors, the family quarters are sadly cramped; large families often occupy one or two rooms, and are, moreover, hospitably inclined towards strangers.

The cooking implements used in these cabins are very primitive. They consist of an iron kettle that swings from a crane over the fire, and a cast-iron bake-oven. This latter is a sort of deep skillet, on

Lomaland Photo. and Engraving Dept.

A TYPICAL LOG CABIN IN NORTH CAROLINA

legs, with a flanged cover; the corn bread is placed inside it, then it is set in the ashes and red hot coals are piled over the top. When not in use it can be conveniently set away in a corner. Johnny cake, potatoes, corn and other things are roasted in the ashes outright.

It is not in these cabins, however, that one finds the most interesting and typical life of this region, because the people there are too poor for varied industries; theirs is a hard struggle for bare existence. It is in the home of the prosperous farmer that we come nearest, perhaps of anywhere in our country, to the busy, varied, self-sustaining life of a colonial manor-house—though of course on a smaller and more restricted scale. Such a home is almost entirely independent of any external source of supply. Some few groceries the farmer purchases every spring and stores them away for the year's use; and these few, such as tea, coffee, sugar and white flour, are generally luxuries, rather than necessities. He raises his own hogs, sheep, and poultry, takes his own corn and buckwheat to the mill to be ground, and hauls wood for the winter fuel with his own oxen and wagon. His children do not lack for sweets with their homely fare; in the spring he collects and boils down the rich sap from the sugar-maple, which affords him a most delicious syrup; and all summer through, in the green-painted hives around his dwelling the bees are storing honey from the rhododendron and golden-rod for his winter's use. The apple is the only fruit that grows well in the mountains, and it is a great food staple. In September, the outer walls of every house and cabin are festooned with strings of peeled and quartered apples, drying in the sun. One likes to fancy they are harvest decorations that have been unconsciously put up in honor of Demeter, the bountiful Earth-Mother, though such an idea would doubtless be most shocking to the matter-of-fact mountaineer.

The housewife and mother of these homes is a marvel of industry. Not only does she attend to the raising of many children; to the cooking, scouring, washing and sewing, the milking, dairying, poultry-feeding and all the minutiae of farm life; but she is, besides all this, the inheritor and practitioner of many old-fashioned arts. She makes delicious cheeses, somewhat resembling the Gruyère cheese of Switzerland; she can cure a sheep or goat skin, so that it makes a lovely soft white rug for the youngest baby to sprawl upon; she pieces quilts in a number of conventional patterns handed down from generation to generation. She also raises flax and understands the process of loosening its fibers and spinning it into linen thread. She weaves

rugs, bedspreads, curtains, sheets, almost every article in fact necessary for household use, and has a repertoire of elaborate designs. She crochets and knits bedspreads in a great variety of patterns, and she makes, by hand, a heavy linen lace which is charmingly effective. There are a number of hand-made looms and spinning-wheels, more than a century old perhaps, and scattered through the mountains; they are objects of pride and affection to their owners, who would not be induced to part with them at any price.

The writer visited, in September last, a lady who is past-mistress of all the industries mentioned above. Her house might well serve as a model at some industrial exhibition. Most of the furniture was made by hand, the rugs, curtains, bed-clothes (including, of course, feather mattresses), all the baskets employed in household use, and even the brooms. These last mentioned articles were particularly delightful. They consisted of a round bundle

of heavy straw bound to a stick, and suggested both by antiquity of design and association of ideas, the days of the Salem witchcraft!

It was pleasant to see the exultant pride with which this lady showed us her things. She and her husband on moving into a newly-built, two-storied house, had had the old one-roomed log cabin of their ancestors moved into a convenient corner of the lot and put into a careful state of preservation. Here are preserved the highly-prized loom, spinning-wheel and distaff of a line of busy housewives; here, on the high antique mantel shelf, are kept the hammered metal lantern and various old instruments of hand-wrought iron; the old kettle still hangs on the crane, fashioned at the forge of some long dead, neighboring blacksmith; and here the mistress of the house comes to spin and weave in a place of hallowed memories. This spirit of respect and reverence for the achievements of the past is all too rare in America; so let us honor these worthy people who appreciate and keep alive their inheritance.

The favorite amusement of the young people is a very charming square dance full of swift impetuous movement and many intricate figures. This could undoubtedly be traced, first to colonial times, then to the stone-flagged kitchens or village greens of "Merrie England." The speculative imagination loves to go still farther back, to Norman, Saxon, Celtic, or other strains, to the folk-dances of antiquity. Perhaps these fantastic, rhythmical figures had once some symbolic significance; perhaps they found a place in gorgeous festivals of mighty civilizations unknown to us.

One cannot fail to compare this merry square dance with our senseless two-steps and waltzes. It is so much more wholesome and genial, more full of expression and meaning. It promotes the feeling of good fellowship, which our so-called round dances exclude, and checks the dangerous personalism which they invite. We should feel grateful to the North Carolina mountaineer for saving to us this, as well as many other inheritances of our forefathers.

B. McC.

Our Peat Resources

ACCORDING to the expert in charge of the peat researches of the U. S. Geological Survey, the bogs and swamps of the country contain nearly 13 billion tons of peat, representing a value of \$38,000,000,000, not counting the value of the by-products. It is to be hoped that if peat ever comes much into demand, the people will be more interested in the wise use of the 13 billion tons than in the scramble for the 38 billion dollars. E.

Students'

Path

OPPORTUNITY

THEY do me wrong who say I come no more
 When once I knock and fail to find you in;
 For every day I stand outside your door,
 And bid you wake and rise to fight and win.
 Wail not for precious chances passed away,
 Weep not for golden ages on the wane;
 Each night I burn the records of the day,
 At sunrise every soul is born again.
 Laugh like a boy at splendors that have sped,
 To vanished joys be blind and deaf and dumb;
 My judgments seal the dead past with its dead,
 But never bind a moment yet to come.
 Though deep in mire, wring not your hands and weep,
 I lend my arm to all who say: "I can."
 No shamefaced outcast ever sank so deep
 But he might rise and be again a man.

Walter Malone in February Inland Printer

The Attainment of Freedom

THE Self that never dies! And what self is it then that does die? Surely there is but one Self, for that which is called the lower self, is not really Self, but a shadow of it. When I say shadow I speak optimistically, of that which I wish were always so. We are all however aware that sometimes the existence of a human being may show such foolish emotion, and such intense physicality of a low order, that that which I have called a shadow, becomes more substantial, and more like an automaton, showing, however, a certain resemblance to that with which it is associated, namely the Higher Self. As well however call a mask, the face of the wearer, as designated by the title of self, that which has only a temporary existence, and at best only an automatic and mechanical faculty of expression. There is no such thing as a tearing down or rebuilding of the Real Self, such as exists in the composition of the automatic part of our selves, owing to the constant play upon it of the forces of Evolution, ever seeking to destroy that which hinders its progress, and to build up that which aids it.

It is the constant taking care of, and undue pampering of our lower natures, that leads to half the worry, trouble and crime in this world; for if men would seek to cultivate more their higher natures, their lower ones would receive less of that attention which overstimulates their activity, and thus strengthens them to carry out their natural bent of folly, heedlessness and crime. "The body follows the mind"; let us then cultivate our mind, see to it that it is properly directed and governed, and our body's rational cultivation will follow as a matter of course.

Let us now ask the question: When one's nature has a certain bias in a wrong direction which one is anxious to correct, why wear oneself out in fighting furiously against that bias which has been slowly built up during

many years? Why not rather, while striving to do our whole duty, leave the rest quietly to the Great Law, knowing full well that thus those things that we desire will eventually be accomplished for us, and our bonds loosened, almost by a miracle as it were, by the simple expedient of using the same law that bound us, to obtain our release. How can we do so? It was desire that bound us was it not? Well, why not use desire to release us, and by desiring exactly the opposite from that which bound us—that is, that whereas formerly we desired the things of the lower nature and selfishly, now we desire those of the higher nature and unselfishly, and when we shall have used the same amount of energy to release ourself as we have used to bind ourself, then shall we be free from our fetters.

Must we always take as long to free ourselves as we took to bind ourselves? Not necessarily, I think; although one must not forget that that which we sow, we must fully reap, and the sudden release from a chain which had proved to be galling, might, unless a balance had been gained, result in a return to former paths of folly, as soon as the effect had worn off.

Would it not, however, be possible for a student of this Divine Wisdom to apply his knowledge in such a direct and concentrated manner, as to secure his release in a far quicker time than it took to bind him? The same amount of energy that it took to bind him, must also be used to release him, but would it not be possible to achieve this in a far shorter space of time, by concentrated efforts consciously directed? I think this must be so.

And the link that connects us with this lower dense form that we have built up, and are now anxious to be rid of, is Desire,— Desire with two poles, the one positive, and the other negative, and in the center neutral. The positive pole stretches away into an infinity of good, and the negative into an infinity of evil, and the warfare lies between the two, sometimes the positive vibrating its influence far beyond the neutral zone, and sometimes the reverse. The more the positive vibration oversteps the neutral zone, and the longer it does so, the sooner will be the return to the paths from which you have strayed, for the negative or animal self cannot stand the vibrations of that which is in direct antagonism to it and so must disintegrate, or be changed by the alchemy of Nature into a force that is in harmony with her higher purposes.

If then we wish to be free, it rests with us to see that no further fuel is supplied to the negative pole in the shape of evil, loose, or foolish thoughts, but that our desire is steadily and continuously directed to the positive pole of our being, until such times as we shall find that that which bound us has disappeared entirely through the turning of our desire from the negative pole of our being to the positive. Surely it is important to remember, however, that in proportion as any desire ceases that which is most predominant in one's nature will reassert itself, and so the advice has been given to desire continuously and constantly that which is beyond you and above you. There is no one in the whole world who is incapable of achieving freedom from any undesirable mode of life, by simply desiring earnestly the opposite of that which bound him, and dwelling daily thereon. W. B.

The Social Problems

DOWN through the ages the Social Problems have been dark spots of impurity which have again and again defied the leaders of nations to eliminate them from their kingdoms. Philanthropists have spent their lives in pursuing projects for the amelioration of the sufferers, while the Law has often failed to punish the offenders. We are now in the 20th century since that great Teacher, Jesus of Nazareth, gave to his disciples, a prayer unto God in which are these words: "Forgive us our trespasses as we forgive them that trespass against us." Yet the old Jewish law that "he that sheddeth man's blood, by man shall his blood be shed," has not been repealed; and in these days capital punishment is still the penalty for certain offenses.

To remove these social blights from the nations is one of the purposes of Theosophy and the three Leaders of the Theosophical Movement. Their teaching, which is the teaching of Theosophy, is that the raising of our consciousness to a higher level, and the conquest of the lower nature, with altruism and compassionate regard for the welfare of others, are necessary to gain self-knowledge and self-control, from which would flow all the reforms needful to remove those evils that threaten Humanity's progress.

H. P. Blavatsky, the first of these Leaders, brought again this knowledge of Theosophy to the Western world; the second, William Q. Judge, built securely on the foundations laid by his predecessor and kept the teachings in their purity from attacks from within and without; and today the third of these Leaders, Katherine Tingley, is teaching it to old and young in the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY and in the Rāja Yoga Academies and Schools which she has founded.

Among the adult students in the "School of Antiquity" at Point Loma, under Katherine Tingley, are to be found men and women from the highest seats of learning, as well as toilers and craftsmen who have earned their bread by the sweat of their brows. Yet the opportunity is before each to become perfect in Self-knowledge and self-control; and they who have attained these even to a degree know that no condition of life could tempt them to reinstate the personal lower self. Having once given their allegiance to the higher, divine Self and having asked its guidance, their endeavor is to work with the higher law of their own being.

It is one of the teachings of Theosophy that if humanity is to achieve its destiny, the personal man must be brought under complete subjection, and the higher, divine, nature be permitted to rule and guide. Only by awakening the individual to a sense of his responsibility, and by arousing him to the realization of the sacredness of his duty to act as a man and as a brother to all his fellowmen, can we hope for any solution to the social problems. And the Teachers of Theosophy declare that the first thing needed is the recognition of Brotherhood as a fact in Nature, the Solidarity of the Human Race.

E. G.

THE tumultuous senses and organs hurry away by force the heart even of the wise man who striveth after perfection. Let a man, restraining all these, remain in devotion at rest in me, his true self.—*Bhagavad Gītā*

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question What is meant by the "higher patriotism"? Is not patriotism, from the standpoint of the lover of humanity as a whole, in reality a selfish and harmful thing? And if, by inserting it before the word "higher," you mean to negative the sense of the word "patriotism," which does and only can mean the love of one's own country, and has little to do with the love of humanity, why use the term at all? Why drag in the idea of patriotism, when what is meant is a general desire for the welfare of the human race? Are you not creating confusion?

Answer The point is one that needs some looking into certainly; without doubt confusion might easily creep in. Let us say at once that no advantage can come of mixing terms. "Patriotism" stands accused of attempting the duty of another, a proceeding dangerous for words and men. As you say, it can and does only mean the love of one's own country, that either native or by adoption.

There is a thing which passes for patriotism that has a grievance against all men of alien race or language. Let it pass for the moment; Theosophy condemns it utterly. Is it ever really a passion of love; or is it hatred merely? Let the Jingo, the chauvinist, the spread-eagle worker-up of racial enmities in the yellow press give answer; as mute an answer as he can. His being is acid and rankles; whereas love flows out evenly, blessing and upbuilding. Give him the name of patriot if you will; he is, according to his darkness, a partisan of the *patria*, a sectarian; so was Torquemada a religious man. Only call his disease emphatically the *lower* patriotism; and give us a term for the kind which is to be advocated, to distinguish it from this.

Patriotism does not mean, in itself, love of humanity as a whole; yet the higher patriotism cannot exist apart from such love. For this worldwide love we have good enough terms, without employing a word that cannot be twisted to mean it without distortion. The first doctrine of Theosophy is Universal Brotherhood; the first demand on a student of Theosophy is that his life shall be given to making brotherhood possible. He must believe in it, and hold all humanity within his heart; he must feed his imagination daily with desire and thought of a world devoid of sin, untroubled by jealousy, knowing nothing of national rancour and strife.

But how shall he bring his ideals nearer? You may think till the end of time, and accomplish nothing; your thought is only valuable when you begin to do; then it may become priceless. "The fool looketh to the ends of the earth," says Solomon; thereby meriting his title of "the Wise." You cannot love Kamchatka or Timbuctoo to any purpose, while you are indifferent to your own native village. What can you do for the Kamchatkans (presuming you to be an American or European)? Think of them? dream of them? agitate your mind over their affairs? even send them letters through the post? All very well; thought is a potent and redeeming thing, *when* it begins to ruffle the surface of action. The great power going out for human salvation needs human beings for points of contact here and there, levers to uplift the world. Let them be dreamers, by all means;

but let them be principally doers. Let their minds be elate with the most starry vision, for whose sake they shall not tolerate the sordid meanness of modern conditions; but let them be at work, or their vision is a sham. Your next-door neighbor, and all the inmates of your household, are souls laboring in the toils of matter: Prometheus bound and torn on Caucasus is no higher or more tragical a theme. Your own village has a message for the world, which may go unproclaimed eternally because of your indifference. These men you may influence daily and hourly; you shall hardly think a thought that does not poison or nourish them. Love is the direct way to their hearts; by which nothing sentimental is meant, but that same strain and thought after the true inwardness of their being, and its unveiling and perfection. You love humanity? Why then, let your home be a pleasant and ennobling place; you can make it so, wherever it be; let your street be the better for whatever your most ardent efforts can do for it; let your life count for purity in your own town; evoke, out of your own being, the soul and divine self of your country.

The influence of a nation is greater than that of a man. We have all been startled by the Turks latterly; whatever be the event, one would say that their revolution has already made a permanent mark on the consciousness of humanity. The spectacle of priest and imâm embracing, of races lately torn by hatred now sworn brothers before the world, has jogged our imaginations; it was like a breath from the hills in the deep, ozoneless thoroughfares of world-life. So too, was the rise of Japan a great fillip and inspiration, unveiling unsuspected possibilities, making a mark on the whole mentality of the West, shunting history onto new tracks. Both of these peoples were lifted by the higher patriotism.

You must love humanity, if you are to possess the higher patriotism, because the higher patriotism is an instrument through which the love of humanity may be put into effect. You may be in such a great position, as to be able to directly serve the world; you almost certainly are in a position to serve the people about you and your country. Then too, there is this! innumerable ties drew you to those surroundings into which you were born; it is always Karma that has placed you where you are. Your heredity represents the sum of your attainments and defects; the balance of all qualities you have acquired through the ages. Each man is a kind of summing up of his race, a nerve ganglion from which currents pass to all the racial extremities, and to which they return. Let him live in his higher nature, and through him shall be revealed all the splendid possibilities of his race. The great patriot is always the star of his nation; what he attained to, the least of his countrymen may reach likewise. The nation affects the world much more easily than does the individual; rather, great men can affect the world most easily through their nations. So that to be a patriot for the sake of humanity is to take the line of least resistance for the lover of the world.

To make one people glorious, and condemn all others; to brag that *your* line is the only one that the gods favor; the only one with a supreme past or present or future—these

things are unworthy of a grown man; miserable personal conceit is at the root of them. Races are like men; there is a god-self behind them which they for the most part pitifully misrepresent. A god-self, and the potentiality of sublime character and genius. Arouse these things, arouse them; call them forth! You are forcing them into general being, as you drag them into being within yourself. You yourself have some definite work to do in the world, which no other human being could do as well. So also has your country its definite part to play; search within your own self and you shall find what that part is. She may go down into oblivion and never take her rightful place; precisely because her sons were unalert, as you are, and without vital interest and love. Then it is the world, which you say you love, which will be the loser. For mother Nature will have to begin her work over again, segregating and leading forth human beings, carefully preparing and working up a nation through ages; suffering all the crudeness and errors of a youthful people; in order to produce that which your present nation might have been.

The higher patriotism is faith in the higher self of one's country; the endeavor to bring that higher self to the fore; not through vanity, but in order that the whole world may be benefited.

M. V.

THEOSOPHIST: . . . We can only perceive that, if things ought to have been different with us, they would have been different; that we are what we have made ourselves, and have only what we have earned for ourselves.

INQUIRER: I am afraid such a conception would only embitter us.

THEO. I believe it is precisely the reverse. It is disbelief in the just law of retribution that is more likely to awaken every combative feeling in man. A child, as much as a man, resents a punishment, or even a reproof he believes to be unmerited, far more than he does a severer punishment, if he feels that it is merited. Belief in Karma is the highest motive for reconciliation to one's lot in this life, and the very strongest incentive toward effort to better the succeeding rebirth. Both of these, indeed, would be destroyed if we supposed that our lot was the result of anything but strict Law, or that destiny was in any other hands than our own.

INQ. You have just asserted that this system of Reincarnation under Karmic law commended itself to reason, justice and the moral sense. But, if so, is it not at some sacrifice of the gentler qualities of sympathy and pity, and thus a hardening of the finer instincts of human nature?

THEO. Only apparently, not really. No man can receive more or less than his deserts without a corresponding injustice of partiality to others; and a law which could be averted through compassion would bring about more misery than it saved, more irritation and curses than thanks. Remember, also, that we do not administer the law, if we do create causes for its effects; it administers itself; and again, that the most copious provision for the manifestation of just compassion and mercy is shown in the state of Devachan.—H. P. Blavatsky, in *The Key to Theosophy*

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West.

Amateur Speculations about the Soul

HOW easy it is to make a "new theory" regarding the life of the soul after death! The only trouble is that it is just as easy for many other people to make many other new theories, and then ours seems lost amid the multitude. What chance is there that any one of these theories will be right? Very little indeed; but there is a very good chance—nay, a virtual certainty—that they will all be wrong. For, whether we reason from axioms or from scientific observation, which one of us is in possession of even a respectable fraction of the data necessary for solving such a stupendous problem? Most of the new theories we find are based upon the latest discoveries and beliefs of modern science up to date; such theories would have been impossible yesterday, tomorrow they will be discarded for others. Of what value are these hasty and shallow speculations? They have about the same value as the steps of a baby learning to walk; after an infinite number of them have been made, the theorists may learn to step straighter and not try to go so far in one stride.

Here is a specimen. The soul of man is an aggregation of "psychomeres," which are "soul-particles inhabiting the individual cells of the human body." These particles may perhaps be visible in ultra-violet light and susceptible of weighing and measuring. It is conjectured that the soul will be found to weigh about one-thousandth part of the weight of the body. After death, these psychomeres, aggregated into a soul-body, float in the earth atmosphere, to which they are suited. They have consciousness and power of locomotion; and their energy, "as it must be derived from some source, is probably obtained from the ultra-violet rays of the sun."

Clearly the theorist has got an inkling of the *linga sarira* or subtle (astral) body within the physical body. This body is universally recognized in Eastern science; and even in the West, where its existence is generally ignored, it has been rediscovered over and over again by daring and unorthodox speculators. The latest researches of modern science in the realms of ultra-physical matter have now, however, rendered it possible for many theorists to rediscover it again without seeming to deviate so far from orthodox lines. But what

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

on earth has this earth-bound body to do with the soul? Somehow or other our theorist has to dovetail his speculations into theological ideas concerning the nature and functions of a soul. This is how he does it. The soul-body lives on ultra-violet rays, hence it has no liver and stomach etc.; relieved from the necessity of satisfying these cravings, it has energy to spare for practising the higher law of service. It is engaged only in the cultivation of the higher virtues of justice, kindness, and sympathy. This theory seems as if it had been made to order; for, in the absence of a supposed necessity for making these psychomeres virtuous, who would ever have thought of doing it? It is most unscientific.

There is no need to quote further speculations, for our readers can easily supply their own after so good a start. Moreover the CENTURY PATH, as a Theosophical organ, is concerned with even more serious matters. Its purpose is not only to educate the mind, but also to present to the public ideas which may be of real service to them in their daily lives. And such speculations play little part in the problems of daily life. Fortunately our daily life is regulated by the accumulated wisdom of ages and by natural laws which we cannot wholly violate, so that we manage to keep fairly well on the track.

What Theosophy has to say about the constitution of man is that there are bodies within bodies, souls within souls, and that the whole question is vastly more complex and profound than is suggested by these speculations. Inquirers should study about the *Seven Principles of Man*, if they wish to learn what there is to be said on the question. They are not asked to accept the teachings on authority, only to study them for the sake of what help they can get out of them; and it can confidently be asserted that they will learn more in half an hour than they ever could from a study of wild conjectures. A lofty source is claimed for the Theosophical teachings; but this claim is not advanced as endorsing the

teachings; on the contrary, the teachings are offered as confirmation of the loftiness of their source. Thus their appeal is to the intuition; while among those who perceive an alive metaphysic in every phase of being, they respond to the demands of justice and common sense.

STUDENT

A Human Salamander

THE papers recount the marvelous powers of a young man, a machinist, who has been investigated by some well known professors of Harvard and Boston. He held his hands in the flame of a kerosine lamp until they were covered with soot, and afterwards bathed his hands and face in a basin of burning alcohol for ten minutes. He feels no pain, and no scars are left. It is also said that he de-materialized, and re-materialized after 41 seconds; but the account does not say whether this was a mere becoming invisible or whether he became intangible also.

Similar phenomena have occurred sporadically at all times. Certain races at the present day can render themselves immune against fire. It has been predicted by the Theosophical Leaders that such powers would soon become too frequent to be denied, as the race is just now taking a critical step in its evolution. Hence one can easily see the importance of such a power as Theosophy and its Society. For, in order that the race may be safely guided through such a critical stage, both knowledge and discipline are essential, and Theosophy is the only thing that can afford them. Theosophy explains the mysteries of our nature and teaches us how to control our faculties by subordinating them to the Higher Law. Theosophy alone is capable of infusing an adequate reverence for the spirit of solidarity, and of rendering the highest moral ideals practical, thus safeguarding the race against the abuse of its powers; and it may not be long ere its services are called into requisition by people and states who may need advice and help in their increasing difficulties.

T.

SURROUNDED by millions of other fishes and creatures that see it, the *Amphioxus* sees them not. Who knows whether, on the Darwinian theory, these "Branchiostoma" are not the direct ancestors of our Materialists.—H. P. Blavatsky

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

ISIS Theater was again crowded last Sunday evening in the expectation of an address by Mrs. Tingley on "The Drink and Drug Habits Considered from the Standpoint of Theosophy." Unfortunately she was unable to be present, having suffered for several days from a severe cold, and her throat making it impossible for her to speak loud enough to be heard. Mrs. Tingley accordingly asked Dr. Herbert Coryn to give an address on the same subject, and at the opening of his remarks, to read the following brief statement dictated by her.

OBSERVER

"The drink and drug question is not an isolated one relating only to drink and drugs, but is part of a larger question, and can only be answered fully when we answer that larger question, and that is by the study of Theosophy and the application of its teachings to our daily lives.

"More than one half of the drunkards and morphine and cocaine habitués have lost their way through ill health, with a high strung nervous system not knowing how to get a balance, seeking a panacea for their unrest, and too many only too ready to push them over the brink.

"What is needed is a better knowledge of man's divine life and of his lower nature. Every state in the union should have institutions outlined on the Theosophical plan for the correction of these habits.

"The minds of those thus afflicted should be diverted from their weaknesses by giving them the real life to live, and awakening in them the power to overcome.

"There should be in every city that kind of entertainment that would satisfy both mind and body, free from all sectarian rule, a Theosophical system in fact carried out on Theosophical principles from its very foundation. Great results would follow, and in time the manufacture of liquor and of drugs would not prove profitable.

"It would take time to do this, and would require a revolution of thought and feeling among the people generally—some drastic and thoughtful changes not yet imagined, before the real evil we are contending against is lessened and removed.

"Educate the children to the standard of Râja Yoga and you will have planted the seed that will keep on growing in the nature until the state of manhood is reached. Then such a one will have the knowledge of his own power to select for himself only modes of thought and action that will go for the upliftment of humanity generally.

"Some of the noblest characters have lost their way through these habits of drink and cocaine and morphine, simply missed in earthly life to find the key to unlock the knowledge of the mysteries of their own natures and of the dangers besetting them. Since the birth of Jesus, if his simple teachings had been followed, if they had been rightly interpreted and applied by those who professed to have the greatest knowledge, we should not now have this terrible condition of affairs.

"Through the knowledge that comes through the teachings of Theosophy, the danger that accompanies the use, even the occasional use of intoxicants and drugs, is clearly seen, and throughout the world among those who have embraced the deeper teachings of Theosophy one will not find any who use them, and yet they are not bound by any pledge. But they can go in and out of a city, and though there be a thousand saloons, there would be no temptation to enter them.

"How shall we remove these dangers that threaten our homes, our cities, our nation? Prayers won't do it; legislation won't do it; sentiment won't do it; fanaticism won't do it; nor will brain-mind plans do it; only the real thing can meet the issue—and that is Theosophy.—San Diego Union

Living as Jesus would have Lived

TO try to live as Jesus would have lived, or even as one imagines Jesus would have lived, is a very ambitious aspiration. Yet even though the experiment fail of its anticipations, it may be useful to the experimenters in two ways: in showing them their possibilities, and in showing them their limitations. In both these respects the experimenters will make discoveries. On the one hand they will find that some of their desires, fancies, habits, and other such personal belongings were unnecessary and can be dispensed with; and they may learn something of the joy of helping others. On the other hand they will certainly find that they have started on the pilgrimage with an insufficient supply of the panoply of righteousness and of spiritual food, and will have to turn back for reinforcements. For it takes a very determined and deep-rooted motive even to keep up the attempt to lead such a life; and no mere ephemeral enthusiasm will suffice.

But the first great obstacle that will bring them to a halt and cause most of them to abandon the enterprise will doubtless be the discovery, that though they have desired to live the Christ-life, they have not yet left off

desiring to lead the worldly life. And as this world is by no means unanimous in trying or even wanting to lead the Christ-life, it is inevitable that sooner or later, a case will present itself in which the two lives present divergent paths, and the pilgrim will have to choose which he will follow. If he offers his coat to the beggar, the beggar may accept it; and other beggars may take advantage of his complacency to denude him of the remainder of his wardrobe. When he offers the other cheek to the smiter, the smiter may smite it; and other smiters may take advantage of his meekness to smite him in other parts. Perhaps his employer may turn him off for refusing to lend himself to some trick of trade which Jesus would not have practised; and perhaps his family may in consequence go to the poorhouse. In short there are numberless cases, which may be left to imagination and experience. In all of them the aspirant will have to choose whether he will continue to follow his chosen path or abandon it; for there is one thing he cannot do, and that is follow both at once. And this is where the difficulty comes in. Perhaps it may not be so hard to live the "higher" life; but what is hard is to find ways of *living both lives*, serving God and Mammon, eating our cake and having it, giving away and yet keeping!

And this is the difficulty we all encounter. We are not perfectly true to ourselves. Desirous of satisfying our own self-respect in the matter of high ideals, yet not prepared on all occasions to abandon the old way, we plan ways of satisfying both demands, the result being frequent disaster. In this way discredit is brought upon the higher ideals, and they are described as impracticable!

It is easy to be generous and polite

Lomaland Photo. and Engraving Dept.

when our own platter is safely filled; but when the generosity and politeness means that our own platter will go empty, it is not so easy — unless, indeed, we are sincere, and then it is quite easy. If a man has made up his mind that come what will, he will be the last, he will be the one to go without, then his path is easy and smooth; the selfishness of others will not hinder the fulfilment of his wishes.

But how difficult it is to find a genuine motive! the mere fact of looking for it lends it an insincerity, precludes spontaneity. Hence the mood of introspection, constraint, artificiality, and even a kind of priggishness. This artificial mood, this acting of a part, this performing before oneself, becomes so irksome that we throw it off and so have what is called a reaction or relapse. Nevertheless it must be faced; for the artificial will gradually become the natural; and new habits, painful in the acquiring, will become second nature.

Living the Christ-life is "a very large order" and the lesson for the experimenters to learn is not to be deterred by failures. Do they wish to resemble the man, who, ambitious to swim, studied up the art out of a book, then threw himself rashly into deep water, sank, was rescued, and never went near the water again? or the celebrated individual we read about, who determined to try early rising, and was so conceited all the morning and so tired all the afternoon that he never tried it again? or the man who, after dinner on December 31st, makes a sudden "resolution," fails to keep it, and forswears all future resolutions? These are fools, neurotics. What we need to do is to try to live a little more like Jesus would have lived, and still a little more, never abandoning the attempt while life lasts; and to realize that there is a great deal of apprentice work for most people to do ere they can begin to study the work of the Master. E.

A Review of the Electron Theory

Prepared, with comments, for the CENTURY PATH by a member of the editorial staff, from an article by Professor L. Graetz in *Umschau* (translated in *Scientific American Supplement*), and from other sources.

ELECTRICITY, or electrical charge, is a kind of matter composed of discrete particles, or *electrons*. It explains the facts of static electricity and some of those of current electricity. It differs from the old one-fluid and two-fluid theories in making the electrical fluid discontinuous and in recognizing its intimate connexion with the luminiferous ether. Here one would pause to ask what is a continuous fluid? We can form no conception of a fluid except on the supposition that it is particled.

The theory of electrolysis states that when a compound molecule is divided by the current, its two parts move in opposite directions towards the respective electrodes. These parts are called *ions* and bear a negative and a positive charge respectively. All monovalent atoms carry equal charges, whether negative or positive, all divalent atoms carry double this charge, and so with higher valencies.

This minimum quantity of electricity, the charge of a monovalent ion, has been termed an electron. These electrons are regarded, by many at least, as being of two kinds — positive and negative. Thus we may consider an ion as being an atom combined with positive or negative electrons equal in number to its

valency: a chlorine ion will consist of one atom of chlorine united with one electron; an oxygen ion, of one atom of oxygen combined with two electrons; and so on. In these two cases the electron will be negative; in the case of hydrogen and other electro-positive atoms the electron will be positive. Thus these electrons have some analogy with monovalent chemical elements: two atoms of hydrogen (a monovalent element) will combine with one atom of oxygen (which is divalent); and two negative electrons will combine with one atom of oxygen; in the former case a molecule of water is produced, in the latter an oxygen ion. In electrolysis the electrons are not set free, but remain attached to atoms in the unvarying proportion of 96,800 coulombs or 9680 c. g. s. units (the figures given by different authorities vary somewhat) to each gram-molecule of a monovalent element, double that quantity in a divalent element, and so on. Thus the charge is inversely proportional to the atomic weight, being greatest for hydrogen.

Our knowledge of electrons was increased by J. J. Thomson's discovery that cathode rays consist of swiftly moving particles negatively electrified. But in this case the ratio between charge and mass is about 2000 times as great as in the hydrogen ion. The rays are generated in a highly rarefied gas, and the above ratio is independent of the nature of that gas. Hence it seems probable that the cathode particles are simply negative electrons uncombined with any ordinary matter at all. Their maximum velocity is 62,151 miles per second. The negative electrons which are expelled by radium in the form of β -rays have still greater velocities but a smaller ratio of charge to mass. The mass ascribed to negative electrons is "an apparent mass which increases with the velocity" — a circumstance which has suggested the highly revolutionary and tautological idea that mass is in reality only momentum. (See CENTURY PATH, no. 14 of this volume, page 3). The positive electron has not been isolated; the positive particles which constitute the canal rays of the vacuum tube and the α -rays of radio-active substances are electrified particles of ordinary matter, and their ratio of charge to mass is equal to or less than that of the hydrogen ion.

The writer now goes on to speak of the intimate connexion between the electrons and the ether, but we must remember that the ether is so far but a hypothesis framed to explain certain effects, so that it would be more correct to speak of the relation between the electrons and these effects. These effects are the attractions and repulsions of electrified bodies, of electric currents, and of magnets, the induction of currents, and other electrical effects produced at a distance. The presence of electrons, and the motion of electrons, produce alterations in these effects, or, as the writer describes it, "strains in the ether." Thus, for the purpose of explaining the transmission of inductive effects, etc., we have still the ether with its waves; but now we have the electrons as intermediaries between ordinary matter and the ether; though perhaps it would be better to regard the electrons and the ether as holding a prior place to matter. Howbeit we have the eternal duality of an active vital force and a passive receptive medium; the former now partially discerned, the latter inferred as a necessary corollary. Whether

either or both of these two may later on prove to be similarly separable into twin parts remains to be seen; but, as minuteness of analysis seems to depend more on the penetration of our faculties and instruments than on any actual limits in Nature, it is probable that such further separation will take place. But we shall never reach the *prime* factors of Nature on this plane of perception.

This new theory of the existence of a finer kind of particles has given rise to dynamical explanations of phenomena, explanations similar to those with which we are familiar in connexion with the old atomic theory. The electronic theory, we are told, undertakes to explain all electrical and magnetic phenomena, "including the phenomena of light." These are due to differences in the arrangement and motion of the electrons. No doubt there is a relation between the phenomena and the behavior of the electrons, but let us suspend our judgment as to which, if either, is the *cause* of the other. Thus, non-conductors of electricity are supposed to have electrons more or less firmly attached to their molecules, while in conductors the electrons are free to move; and they move in small ranges, communicating their motion to each other by impact, as the molecules of gases are said to do. The conduction of heat is also accounted for by the impact of vibrating electrons — instead of, as formerly, by the impact of vibrating molecules; and while one kind of vibration accompanies the manifestation of heat (or "constitutes" heat as our authority has it) another kind of vibration stands for an electric current. Numerous attempts have been made to represent, by similar dynamic formulae, other effects in matter; it is stated that the proportionality of thermal to electric conductivity has been thus explained, but that the variation of conductivity with temperature still awaits explanation. These explanations are but little more than analogies or illustrations, and no doubt other sciences than our own have been able to achieve results by using quite other symbolism, such as that of Nature-Spirits, which we call superstition. But heavens! what a Pantheon and mythology and demonology one *could* build up out of the materials provided by modern scientific speculation.

The theory that atoms are made up of electrons has received additional support from the phenomena of radio-activity, in which atoms are apparently disintegrated into their positive and negative components, which appear in the form of α - and β -rays. The components of the atom are (1) negative electrons, and (2) ions or particles of far greater and nearly atomic mass which are, on the whole, positively electrified, though containing negative electrons.

Positive electrons, equal in mass, and equal in the ratio between charge and mass, to negative electrons, have not yet been isolated; and one idea is that positive atoms are merely atoms deprived of their negative electrons. Thus there is the old question as to whether the difference between positive and negative is one of quality or quantity; which, since quantity is a quality, does not much matter after all.

Ampère's theory accounting for magnetism by molecular currents has now been superseded by the theory that magnetism is due to electrons moving in circular orbits. T.

Art Music Literature and the Drama

An Addition to the Art-Lore of America

NOT long since two young students in Rome, while rummaging about in one of the enormous libraries of the city, looking over and deciphering priceless old manuscripts of medieval days, came upon a little bound volume which was apparently a diary. It was filled with notes, memoranda, and chemist's recipes of various kinds. The name on the fly-leaf was "Michelangelo."

With almost bated breath these students began the reading of it and finally came to an entry consisting of descriptive notes about the great artist's explorations in the Forum, the Baths of Caracalla, and the Palace of Titus. Among other things the diary related that one day, in digging about the *thermae* or baths, Michelangelo and his assistants opened up what the artist at once saw to be the work-room of a fresco painter. In company with Raphael he explored it, finding among other things some immense earthenware jars containing what Raphael pronounced lime for fresco work.

Each of the artists took a portion home to his own studio, there experimented, and found that pigments mixed with it took on an unwonted brilliancy which gave every sign of being permanent. Michelangelo, however, was chemist as well as painter, and upon analysing this substance in his laboratory ascertained that it was not lime at all but a certain fine silicate.

He at once set himself to manufacture more, not only suspending his work in the Sistine Chapel but destroying what had already been done of it. Then he calmly locked the door and with the help of his assistants worked night and day upon the great ceiling until it was completed.

But the secret died with the artist and three hundred years passed before the finding of this priceless little journal brought it again to light. By some strange Karmic influences the original book was lost "by accident" in the Tiber and these students tried in vain to interest the fresco artists of Italy and Germany in the notes they had fortunately made from the diary. They met only ridicule. Finally one of them came to America, succeeded in interesting an Eastern architect sufficiently to induce him to experiment with the recipe, and as a result a number of rooms are now being decorated, according to it, in the Capitol at Washington. The effect is luminous and beautiful to a degree and the most severe tests have proven the colors to be enduring.

One cannot but reflect upon the Law that has, seemingly, been saving this century-old

secret for the enrichment of the art-lore and the art-life of the new land which was discovered by a son of Italy; by Columbus of Genoa. The past has many secrets yet stored away, and it were only to be expected that the harvest of facts and examples which are now being garnered therefrom by archaeologists should prove to be as great a benefit in the world of art as in the domains of science, history, literature, architecture, or music.

MUSIC

MOVE on, light hands, so strongly tenderly,
Now with dropped calm and yearning undersong,
Now swift and loud, tumultuously strong,
And I in darkness, sitting near to thee,
Shall only hear, and feel, but shall not see,
One hour made passionately bright with dreams,
Keen glimpses of life's splendor, dashing gleams
Of what we would, and what we cannot be.

Surely not painful ever, yet not glad,
Shall such hours be to me, but blindly sweet,
Sharp with all yearning, and all fact at strife,
Dreams that shine by with unremembered feet,
And tones that like far distance make this life
Spectral and wonderful and strangely sad.

Archibald Lampman—Selected

From the Musician's Viewpoint

ONE of the younger generation of Swedish composers, Hugo Alfvén, was recently asked by a friend why, since he has gained a separate fame as a writer upon literature, art, architecture, and travel, he has never yet written upon the subject of music. A partial translation of the letter which contained his reply is given below. Hugo Alfvén has doubtless a great future, musically, for he has pictured, in his compositions, national characteristics in a wholly original way as may be divined from the following:

... It is my misfortune that I sometimes lack the power to see the line of demarcation between the real and the unreal, thus mistaking the dream for the experiences of waking life. This has often caused me a deal of trouble and it has even happened that I have been accused of untruthfulness. I have, however, taken the charge with evenness of mind, console myself that the defect, after all, has been of some use in my art.

I would probably have given a truer picture of my way of composing, had I been able to speak of the "inner ear" which certainly is the most developed of my faculties. There is nothing I am as sensitive to as to sounds and noise: the voice in all its expressions of the feelings, the rustle of the wind, the murmur of the sea, the thunder, etc. How I would like to describe sound as I hear it interiorly. At the least musical idea that comes, it is as if I heard far away the rising and falling reverberation of an orchestra. The more the imagination is stimulated, the more clearly do I perceive the different instruments and their combinations of sonorousness, singing masses, single voices, sometimes an inferno, sometimes a heaven. This is a world to me more real than the outer world in which I am living. It is in the second place that the eye comes as an element of helpfulness, and then the other senses with their greater or lesser power of spiritualization. I can write and speak of everything I may experience, only excepting what relates to music. A letter about music, a criticism or something of my own musical creed, I am unable to write, and I have not even tried to do so, sure as I am that against my will, it would not intimately bring forth the musician, but be rather a protecting disguise, an impenetrable armor. It seems as if nothing could come forth

from my tone factory by any other means than by the finished works themselves. This may perhaps be a defect, but I cannot change anything of it. One can only speak of the wonderful realm of the tones by the tones themselves. The word is inadequate. Precisely what one would catch, that slips away. . . .

Every musician who honestly strives to interpret that pure ideal which is all unstained by ambition touches the fringe of the eternal mysteries of being. In certain aspects the composer often seems to us to reach closer to the center of things than the performer, yet no one may assert this to be the case, for the character of the musician, his very heart of heart, is the criterion and the test. To attempt to explain this mystery in words will ever be futile.

A SWEDISH STUDENT

Occultism is the Science of Life, the Art of Living.

HELENA PETROVNA BLAVATSKY in *Lucifer*

Why Do We Do It?

THE aimlessness of life for those who have no idea of its purpose and no knowledge of their own nature is apparent in all walks of life. Not only is the lot of the hard worker in fustian or broadcloth a continual grind without a goal, but the fate of the unemployed well-to-do is not less tedious and aimless, in spite of what envy may say. Even in light papers one finds, expressed in a light semi-jocular vein, occasional outbursts of what, if expressed in more stately terms, would be a repetition of Solomon's sermons on the vanity of a worldly life. Risking the chance of being called to order for taking such an utterance too seriously, one may quote as a sample the following from the ladies' column in *Black and White* (London). It is headed, "Why Do We Do It?"

... What a life I lead, my dear, as a rule! Always on the move, and always in a trunk. We rushed up to town, after shooting pheasants, to buy Christmas presents. We rushed out of town for the holidays because it is the proper thing to do. Then we rushed back again, and I should have rushed abroad with the others if it had not been for this blessed cold. I can't think why we do it when we would all rather be at home, except that we don't seem able to help ourselves once we are in it. Life's a merry-go-round that never stops, with the "merry" left out.

And with this outburst the matter ends for most of them. There are few who get so far as to think seriously upon their abject slavery (for such it is, according to this confession), and to resolve that they will not stand by it any longer.

Doesn't know why she does it! Doesn't seem able to help herself! Confession of slavery both of mind and will. The outburst just quoted may have been said lightly, but there is seriousness behind it all the same. People are very miserable from that cause, and some even commit suicide. The aimlessness and dreary monotony of life are a very real tribulation.

We may talk of the evils of individualism

and propose collectivism as a remedy, but the loose employment of such words breeds confusion. There is but little individualism in the kind of life depicted. The actor in it suffered from lack of individuality. She was the servant of something that certainly was not her own individuality, nor anybody else's

SPRING RAIN

'NEATH unnumbered crystal arrows—

Crystal arrows from the quiver
Of a cloud—the waters shiver
In the woodland's dim domain,
And the whispering of the rain
Tinkles sweet on silver Teign—
Tinkles on the river.

Through unnumbered sweet recesses—

Sweet recesses soft in lining
Of green moss with ivy twining—
Daffodils, a sparkling train,
Twinkle through the whispering rain,
Twinkle bright by silver Teign,
With a starry shining.

'Mid unnumbered little leaf-buds—

Little leaf-buds surely bringing
Spring once more—song birds are winging,
And their mellow notes again
Throb across the whispering rain,
Till the banks of silver Teign
Echo with their singing.

From *The Children of the Mist*—Selected

individuality. What was this force that impelled her and all with her in directions contrary to their will and wish? Let us not answer the question by an abstraction; Theosophy is practical and concrete. Actions can only be inspired by *Mind*, and there must have been some *Mind* at work here, a *Mind* powerful enough to dominate the individual minds. What was this *Mind*? The answer is that it is possible for the thoughts and desires of many minds to coalesce into a composite *Mind* and Will that actually exists in some realm of "space," and owns an operative center in

each individual mind where it sits at the keyboard of action and rules the mechanism. It acts through fear, vanity, or mere undefined impulse; to act contrary to it demands a sacrifice of ease, self-esteem or indolence; and so the individuals yield to it. Thus they are all in effect *hypnotized*, hypnotized to do that which they would rather not do, hypnotized by a *Mind*. And this is what is called *freedom*; as if there could be any real freedom while our actions are determined by such forces.

What a lot of breath and printer's ink we expend on discussing political and other kinds of formal freedom, when the bulk of civilized humanity is bound hand and foot by these fetishes! Business, fashion, habit, belief—whatever it may be, it binds us fast during life. No man can ever be free under any conditions who is so bound; no man can ever under any conditions be enslaved who has mastered this Mystery.

If the victims of fashion and social convention were in earnest there could be a way to extricate themselves from the tyranny. But one fears to suggest it, owing to the tendency of unstable human nature to rush to violent extremes and do something equally absurd, and equally unoriginal, in another direction. But there is no need to become a spectacle or any of the recognized types of crank. There are such things as discrimination and dignity, and it is possible to assert one's independence without being obtrusive. There is an inner domain into which nobody can follow us and where we may reign. Let us begin by cultivating that. There we may propound the questions, "What is Life?" "Who am I?" "Whither am I tending?" and learn that the superficial motives and fancies that flit across the mind and are suffered to regulate our actions are but a phantasmagoria hiding the real life. Then it may become possible to fathom the deeper springs of motive and to unearth worthier and loftier purposes. Some other Law than that of fashion and convention may be discovered, such as the Law

which unites and constrains all who work in the service of humanity. The eternal questions which the mind must ask itself should not be continually pushed away but grappled with; and one should seek to know what life is, where was the Soul before birth, and what is its destiny after the death of the body. In short one should seek to make life a reality instead of the sham it confessedly is. E.

The Philosophy of Manners

ALL books on the subject of etiquette, however little or much space be given to forms and conventionalities, maintain that the basic principles underlying good manners rest upon a yet deeper stratum of innate delicacy of feeling and kindness of heart. There is much veneer that passes in a general way for the genuine and solid article, but to the minds of those who can penetrate beneath polished surfaces there is no varnish thick enough to conceal coarseness or cruelty if either lie beneath. Some unguarded moment at last is sure to make the revelation.

But there are other requisites to good breeding; a kind heart alone is not enough. A person may abound in kindly impulses and generous sentiments toward his fellows, and yet be so full of vanity and egotism that his conceited manners hide his virtues completely. Being so greatly concerned with the display of his own acquirements or opinions he does not foresee the possible havoc he may make with the feelings of other people, and so, going beyond a certain boundary, he steps into the realm of boredom, alas for him!

In the same category with the inconsiderate type mentioned above should be placed the names of those people who laughingly throw out insinuations wearing an innocent garb but carrying underneath a sting and a poison. The cloak of mirthfulness in part conceals the dire intention, so that it is quite possible for the offender to escape the rebuke he deserves; but the mischief is done, and though the method of concealment be ever so innocent in appearance, it is the acme of impertinence and cruelty. Honest rudeness that admits of a fair battle on its own premises is far more worthy of toleration. Yet there are many people, on the other hand, who pride themselves upon their "bluntness." Aside from being no fitting subject for complacency, it most effectually conceals the nobility and rugged honesty which (at times) does lie beneath.

The man or woman who is welcome upon every occasion is the one who has a thoughtful consideration of others' feelings, not in the sentimental way, but in the large and generous

way. He must be goodnatured. He must feel a deference for those to whom deference is due, and a proper dignity with those who reveal the lack of it in their own natures. He must avoid pedantry, and possess tolerance. He must himself have suffered and overcome sensitiveness in order to comprehend another's mental state and meet it safely.

In short it is difficult to arrive at the manner of social intercourse which ordinarily bears the title of good breeding without first having more than an average knowledge of human nature with all that this implies. Some people are students of character and intuitively read the motives and actions of others. Unhesitatingly are they ready, in any case, to say the right thing at the right time, and to perform the gracious act. In conversational emergen-

Childhood, Lost and Regained

CERTAINLY Adam in Paradise had not more sweet and curious apprehensions of the world, than I when I was a child. . . . The corn was orient and immortal wheat, which never should be reaped, nor was ever sown. I thought it had stood from everlasting to everlasting. The dust and stones of the street were as precious as gold: the gates were at first the end of the world. The green trees, when I saw them first, through one of the gates, transported and ravished me, their sweetness and unusual beauty made my heart to leap, and almost mad with ecstasy, they were such strange and wonderful things. The Men! O what venerable and reverend creatures did the aged seem! Immortal Cherubims! And young men glittering and sparkling Angels, and maids strange seraphic pieces of life and beauty! Boys and girls tumbling in the

Lomaland Photo. and Engraving Dept.

MARBLE ARCH, HYDE PARK, LONDON

cies one of this sort is quick enough to spring to the rescue and avert embarrassment or disaster. The ability thus to protect a situation requires tact and it is the very essence of good breeding.

The person without tact has not yet passed the first examination for entry into the school of good manners. There are pitfalls all about and the only thing that he can be depended upon to do is to tumble into them.

A tactful woman! What a treasure she is upon all occasions! She is one who at some period of her existence has learned the secret of occupying another's standpoint, of feeling by intuition another's need. This places her beyond the danger of mistakes and, with a kind heart and calm, clear mind, she enters upon her social pathway with positiveness and success. In self-forgetfulness she radiates joy and beneficence, enlightenment and true culture wherever she may be. EDITH WHITE

street, and playing, were moving jewels. I knew not that they were born or should die; but all things abided eternally as they were in their proper places. Eternity was manifest in the Light of Day, and something infinite behind everything appeared: which talked with my expectation and moved my desire. The city seemed to stand in Eden, or to be built in Heaven. The streets were mine, the temple was mine, the people were mine, their clothes and gold and silver were mine, as much as their sparkling eyes, fair skins and ruddy faces. The skies were mine, and so were the sun and moon and stars, and all the World was mine; and I the only spectator and enjoyer of it. I knew no churlish proprieties, nor bounds, nor divisions: but all proprieties and divisions were mine: all treasures and the possessors of them. So that with much ado I was corrupted, and made to learn the dirty devices of this world. Which now I unlearn, and become, as it were, a little child again that I may enter into the Kingdom of God.

(From the *Meditations* of Thomas Traherne, an English mystic of the Seventeenth Century.)

OUR YOUNG FOLK

Mending the Nets

PERHAPS there is not another bay which holds such a variety of fish as the Bay of Naples. Fishing is still a great industry there and nets are used extensively. One of the principal fish of commerce is the small anchovy which abounds in the bay and is caught in great quantities in long fine nets such as you see being carefully mended in the accompanying picture. These little fish are often mentioned as being used as delicacies in the time of the old Romans.

We know that for at least two thousand years the Bay of Naples has furnished fish for the fisherman. How many years before that, history does not tell, but probably many more; for there are many ruined cities along that coast of which little is known as yet; and still Nature provides the people who ply this most ancient of industries along her most beautiful bay.

EUGENIA

Raphael

UPON the golden honor roll of the world where the names of the best and greatest men, those who have done the noblest work, are written, stands the name of Raphael, the great Italian artist.

Not very much is known of the childhood of this noble man. He was born in the little town of Urbino in Italy. His father was an artist too, and painted thoughtful, reverent pictures, though they were not so beautiful as those that his son afterwards painted. On the wall of a room in their little home is a faded painting of a mother and child. It is the baby Raphael sitting in his mother's lap. It was painted by his father.

Raphael was dearly loved by his father and mother, and they filled his life with beauty. When he was a very little boy his mother told him stories of the great artists who were then living, and of the noble work they were doing. His father was his first teacher in drawing and painting. He often took little Raphael to the palace of a certain nobleman and showed him the beautiful pictures, wall-paintings, and statuary, and all the treasures of gold, silver, and wrought iron, made by the artists of that day. As the flower welcomes the sunshine, the breezes, and the dew, so little Raphael drank in all the beauty that he saw. Before he was twelve years old both his parents had passed away, but he kept his love for them and the memory of all that they had done for him, all his life.

Raphael's parents left him in charge of kind friends who loved him and cared for him.

Lomaland Photo. and Engraving Dept.

NET MENDING ON THE STREET IN NAPLES

A DAY WELL SPENT

AND, when the precious hours are done,
How sweet, at set of sun,
To gather up the fair laborious day;
To have struck some blow for right
With tongue, or pen;
To have smoothed the path to light
For wandering men;
To have chased some Fiend of Ill away;
To have borne down Giant Despair,
To have dealt a blow at Care.

Lewis Morris

He continued to study both drawing and painting, and must have been a most painstaking little pupil, for when he was seventeen years old he was taken to the studio of one of the best artists of Italy. He could already do good work. When his future master, Perugino, first saw Raphael, he was so slender and beautiful that the master thought he was like a girl. It was not long, however, before he found out what a manly, courageous lad had come to work with him. Soon he grew to love his pupil as if he were his own son. He taught him all he knew. This was a great deal, for Perugino was one of the best painters of his time. Raphael was an affectionate, grateful pupil, and showed his gratitude by learning all that his master had to teach.

Raphael had the true hero-spirit in his heart. He showed it by his industry and perseverance, and it also shows in his beautiful pictures. One of his earliest pictures was of a knight in full armor lying on the ground, asleep. In a dream two angels appear to him.

One comes bearing flowers and pointing out an easy path in life. The other holds out a sword to him. We know that young Raphael chose the sword; for although his life was short, he worked so faithfully and so well that he did as much in a few years as if he had lived to be an old man.

One of Raphael's most beautiful wall paintings represents the School in Athens. In it all the noble old Greek philosophers and teachers appear. There are Pythagoras, Plato, Socrates, and many others whom we know and love. And down in one corner, just entering, are Raphael and his beloved master Perugino. Raphael has given his teacher the first place, although at that time, Raphael himself was acknowledged by all to be the greatest artist in the world. In this way he showed his love and gratitude to his old teacher.

Raphael painted many beautiful pictures. These have all been photographed, and copied by painters who loved them,

so that they are known in all lands. STUDENT

An Anecdote about General Lee

THE following little story shows the magnanimity of this great soldier and gallant gentleman. It was told by a Union veteran apropos of the battle of Gettysburg.

STUDENT

The last day of the fight I was badly wounded. A ball shattered my left leg. I lay on the ground not far from Cemetery Ridge, and as General Lee ordered his retreat, he and his officers rode near me. As they came along I recognized him, and, although faint and suffering, I raised up my hands and shouted as loud as I could, "Hurrah for the Union!"

The general heard me, looked, stopped his horse, dismounted, and came toward me. I confess that I at first thought he meant to kill me. But as he came up he looked down at me with such a sad expression upon his face that all fear left me, and I wondered what he was about.

He extended his hand to me, and grasping mine firmly looked right into my eyes, and said: "My son, I hope you will soon be well."

I shall never forget the expression on General Lee's face. There he was, defeated, retiring from a field that had cost him and his cause almost their last hope, and yet he stopped to say words like those to a Union soldier who had taunted him as he passed by. As soon as the general left me I cried myself to sleep there upon the bloody ground.

AN excellent means of keeping ourselves in an inward quiet and freedom of spirit, is to put an end, at the close of every action, to all further thought about it, by dismissing all the reflections of self-love, whether of self-complacency or regret.—Fénelon

THE CHILDREN'S HOUR

LUCK

LUCK tapped upon a cottage door,
A gentle, quiet tap,
And Laziness, who lounged within,
The cat upon his lap,
Stretched out his slippers to the fire,
And gave a sleepy yawn;
"Oh, bother! let him knock again!"
He said, but Luck was gone.

Luck tapped again, more faintly still,
Upon another door,
Where Industry was hard at work
Mending his cottage floor,
The door was opened wide at once;
"Come in!" the worker cried,
And Luck was taken by the hand
And fairly pulled inside.

He is still there—a wondrous guest
From out whose magic hand
Fortune flows fast—but Laziness
Can never understand
How Industry found such a friend.
"Luck never came my way,"
He sighs, and quite forgets the knock
Upon his door that day.

Selected

The Acorns

"IT'S too bad. Mother is too particular, to make me stop and put everything straight," were Lucy's first words as she started out with her brother Herbert for a ramble. This afternoon they had escaped to their favorite copse. It was like a little fairy-land of their own, for they knew every twist and turn of the paths that wandered in and out among the trees. One they called the Queen's Lane and another the Knights' Green.

They played delightful games of make-believe. Lucy was bewitched into a tree and Herbert valiantly hunted for the sorceress to compel her to break the spell. Suddenly they heard the distant thud, thud, jumpety-jump of a horse really coming through their fairy land. Quickly the steady trot, trot, came closer. What was the children's delight to see a familiar and beloved face. It was their favorite uncle who had ridden over to surprise them. "O Uncle, stop, stop!" they cried, and as he jumped from his horse they took his hands, dancing round him with delight. "Come and see where the fairies dance at night; see, here is the stable, tie up your horse"; and from one thing to another they led him on. He did not seem in such a hurry as most grown-up people and he never laughed at their "make-believes." "Now come and sit under the King's Oak and talk to us," they begged him.

All around them lay the acorns. "Only fancy," said Uncle Henry, "what a forest of oak trees might grow one day if all these acorns were planted!" "Why, could they all be trees?" said Lucy, "each one of these little brown things grow into a great oak?"

"Yes, do you see how this one has cracked at the point, and right in the heart of the nut so carefully protected is the little germ that

Lomaland Photo. and Engraving Dept.

JUNIOR DRILL CORPS OF THE RAJA YOGA ACADEMY
SANTIAGO DE CUBA

has the life of the great tree in it? See how small it is!"

"How does it begin to grow into a tree, Uncle?" "Well, Lucy, the nut is filled inside with some food which the little plant lives on until it has grown strong enough to get its little roots into the ground and push its little head upward into the sunlight; then it soon finds out how to take what it needs for itself. As soon as the little root gets out of the nut it knows which way it has to turn; the young plant never makes the mistake of growing its root upwards or of sending its stem down into the ground."

Before they left each had planted an acorn to make a future tree, and then had carefully marked the spot.

A great change came into the children's life. That night they learned that their eldest brother had been taking money from the firm for which he worked; and they would have to go and live in the city where their father would work hard to repay the money.

How sad seemed the house to them now! Their mother was so often crying. "Why did Tom steal, mother?" asked Lucy. "He did not mean to steal, my dear. At first he took a little, meaning to put it back. Gradually he took more and more and thought less and less about it. I can trace the very beginning—when he was a little boy and used other people's things and was careless of returning them." She sighed deeply and added as if to herself: "He has grown the wrong way."

Amidst the confusion of their rapidly changing life the children found time one after-

noon to seek out their acorns. Sure enough their little roots had all found their way into the ground.

"Oh dear!" said Lucy, "I wish boys knew how to grow the right way as well as acorns, and then we should never have had to leave our home!"

"Lucy, let's remember," said Herbert, "when mother seems *very* particular, she is only trying to help us to grow the right way."
E. L. W.

Ages of Animals

WE generally make the mistake of thinking all animals short-lived because those we know best, our own domestic animals, are comparatively so—the average age of cats being fifteen years; dogs, twenty; and horses from twenty-five to thirty years. We speak of these animals as "old" often when they are but eight or ten years of age, because kittens, puppies, and colts, begin to take care of themselves so early and have finished their frolicsome baby days and become full grown cats, dogs, and horses by the time they are two or three years old. Perhaps the fact of their having been domesticated and having lived with man so many centuries has made them short-lived, for man's span of life is short too, now, though in old books we read of men who lived several hundred years.

Eagles, pelicans, swans, and ravens often live over a hundred years. Tortoises, too, are centenarians, though that doesn't surprise us as they are so slow they take their time about everything, even about dying. Camels are quite long-lived and elephants have been known to live for centuries.

*The Theosophical
book of the
Twentieth century*

Tells the story and the history of the
Theosophical Movement.

The prices are \$2 in cloth and \$1.00 in
paper, which barely cover the cost, for it is
printed and bound, not gaudily, but with
such carefulness and thoroughness of art
and craft as to make it unique among
modern edition books.

**SOME OF THE ERRORS OF CHRISTIAN
SCIENCE
CRITICISM**

by **H. P. Blavatsky and William Q. Judge**

CONTENTS:

"The Empty Vessel Makes the Greatest Sound"
A Note of Warning

—by *H. P. Blavatsky*

Of "Metaphysical Healing"
Affirmations and Denials
The Cure of Diseases

Replanting Diseases for Future Use
—by *William Q. Judge*

A MOST VALUABLE PAMPHLET. Outside of Theosophy
there is given no adequate explanation of the healing
that is at times accomplished, nor of its *rationale*,
nor of the ultimate price that must be paid and the
dangers connected with such practices.

This pamphlet is invaluable to all students.

Darwinism

AN article on "Darwinism Fifty Years After," in the *Scientific American Supplement*, makes difficult reading, chiefly owing to the confusion arising from the neglect to distinguish between effects and causes. "Heredity and variation are innate, or intrinsic causes," we are told; but obviously they are effects. What the causes of them may be we are not told, and this is perhaps what led the writer to say that "with all our increase of knowledge we are no nearer the end of the problem."

Darwin, with whom, of course, must be mentioned his still-living co-worker, Alfred Russel Wallace, evidently did a great deal in methodizing the study of natural history, and seems to have had the idea that the higher organisms have descended hereditarily from the lower in a continuous chain. And the writer says:

That the animals and plants today, man included, are descended from the animals and plants of earlier periods by natural lines of descent with natural modifications, due to innate and external causes, is one of the certainties of science.

Much Still Scientifically Uncertain

One has doubts, however, whether even scientific authorities are unanimous on this point. The evidence does not seem strong enough to warrant a certainty. The present types seem to be remarkably permanent within the limits of historical knowledge, and it would surely require inconceivable millions of years for one order to change into another order. It seems to an outsider as if the scientists here were reasoning deductively, as their difficulty is to find facts to support their theory. They feel that they have got hold of a sound principle, and they seek to establish it. But the restricted sphere of their observations prevents them from doing so. They seek only in the visible world of physical forms. Here they see the organisms emerging upon the physical plane, but they see not whence they come. They do not see where the changes, the evolutions, take place. The only place which they can think of, in which to search, is reproduction. But each form reproduces its own kind, and does not even (so science itself declares)

The Scientific Evolution Only Relates to the Forms

reproduce its own acquired characteristics. Hence the observations do not support the theory. But what about the animals themselves that tenant these forms? What can science tell us about them? They watch an egg grow into an animal, and to them it seems to come from nowhere, like a stream of water issuing from a point in space. If we were to speak of the evolution of palaces from man-

sions, and mansions from cots; or of cannons from guns, and guns from pistols; or of an evolution of furniture, clothing, or whatever else shows progressive variations in form — we should be arguing similarly to these biologists. It may be said that reproduction constitutes a radical difference between the two cases; but until it can be shown that reproduction plays a part in the transmission of the changes, it is a difference which is not relevant. And reproduction tends to perpetuate and preserve types, not to change them.

Evolution does go on; it is a universal law; but the changes take place mostly on planes beyond the physical. It is the animal souls inhabiting the animals' bodies — it is these that change and grow. It is the "soul" of the plant, the *life-monad* tenanted the visible form — this is what evolves. A life which has at one time inhabited one form may develop so as to be able to inhabit a higher form, and thus the life or soul develops while the forms remain (for a long period at least) unchanged.

Darwin is justly regarded as a great epoch-maker in thought; but his weak points seem to get more credit than his real strong ones. He intuitively grasped the truth of evolution and the truth of law and order, and daringly broke away from the trammels of prejudice. But he was too one-sided and dealt almost exclusively with the outer and physical aspect of things. His neglect of the superphysical aspect prevented him from discerning the actual laws and processes of evolution, and he had to imagine other processes for which there is no warrant in nature.

But the most important point is surely this — that, whether Darwin was right or wrong, still he has told us nothing whatever about the intelligences and powers that operate to produce the effects he described. His ideas may be accepted in their entirety and still leave plenty of room for whole hierarchies of creative gods.

The absurd notion that the work of Darwin and his associates and followers has in any way driven spiritual powers out of the universe is rapidly vanishing. Such a notion could but be the first flush of vanity following the sudden liberation from the preceding dogmatism. It is now seen that a fuller revelation of the mechanism of the universe demands an even greater recognition of the existence of Intelligences behind that mechanism. It is only the old theological God and his accompaniments that have disappeared; but in their place we must have Cosmic Ideation and the Universal

Life and all the innumerable hierarchies of Intelligences and Beings which proceed therefrom. For a universe wholly mechanical is a

**An Illogical
Misuse of
Words**

nightmare of logic, a delusion which can only be kept up by using abstract words as counters without ever cashing them at their true value. Evolution is a fact in nature, but evolution cannot make things grow — unless by evolution we mean Spirit. It is just like the case of gravitation: the principle that all masses attract each other is called gravitation, but we still know nothing whatever of the nature of the influence that draws the masses together; and to say that gravitation draws them together is to commit a childish blunder in the use of words and ideas. So with these words, evolution, natural selection, survival of the fittest, etc.—they are words denoting principles, words summing up groups of effects, but they do not stand for causes, except by a similar perversion of logic.

The great cause of evolution is the Universal Life, which is intelligent. STUDENT

Matter and the Corpuscular Theory

A WRITER points out that matter is no longer eternal, as it was thought in past years to be; for under certain conditions it has been found to pass through successive states of disintegration until finally the particle vanishes into ether. Now the atoms are recognized to be wonderful reservoirs of energy. But, continues the writer,

What strange reservoirs are imagined under the aspect of microscopic suns, around which planetary particles, a thousand times smaller yet, are gravitating with incommensurable speed! By what miracle are these particles turning thus in a mad frenzy round a spheroid, without ever striking against one another in their wild whirlings? . . . Can a wall be made of stones separated from each other and never coming into contact by their surfaces? Can it be made of round bricks, without cohesion, and owing their equilibrium to their individual rotations? Is a spider's web, so thin and yet so strong . . . formed of minute balls having no connecting point with each other? (*English Mechanic*)

It is indeed strange how so many scientific theorists ignore this prime difficulty of accounting for *action at a distance*. They split their heads trying to devise elaborate explanations, regardless of the fact that so long as this fundamental problem remains unsolved, all these explanations are superfluous. One man explains attraction by saying that all pulls are in reality pushes; but is a push easier to explain than a pull? It is no use explaining gravitational stress as being a pressure in the ether, for it is no easier to account for the transmission of a pressure. If a stick is a row of particles separated by spaces, then how is a push given to one end transmitted to the other end? And the same difficulty recurs if we imagine an ether, for the ether itself is likewise supposed to be particled.

The fact is that our conceptions of space, magnitude, and other related things, are limitations of the mind which preclude any final explanation, and we must take some things for granted. We know that influences are transmitted across spaces both microscopic and sidereal in their dimensions; and the only alternative is to imagine these spaces filled with a "continuous fluid"—a conception which is no easier than the conception of ac-

tion at a distance. Therefore these problems can only be cleared up by acquiring the ability to use the higher faculties of the intellect which are independent of such limitations.

STUDENT

Prison Possibilities

IN the Philippines they seem to have solved the problem of the post-penitential employment and general career of the criminal. They have solved it by being anxious instead of reluctant to employ him, knowing that he is a better man and a better workman than when he went into prison. They know this by knowing that the prison is a training, more than a punitive, institution.

The first thing on the prisoners' entry is to make them healthy, effected by an individually adapted medical *régime*. This is completed by a short military drill course, perfecting their external physique and giving them some ideas about discipline.

Then comes a division into three classes, according to conduct, the stimulus being so compelling that 90% are in the first. But the stimulant is not punishment, but privilege. The privilege consists of evening lectures on subjects of general education, ball games and various recreations, all the books desired, and liberty to write letters. These are additions to the general program; and that consists of work at all sorts of trades, the working day being of seven and a half hours, evening instruction in these trades, and an evening parade to the music of a band. The cells are in perfect accord with hygiene; a bath is taken every day; and every day a clean set of clothes is put on.

Another group is occupied throughout the island in public works, looked after and trained in somewhat the same way. And another occupies an agricultural colony. Says the New York *Sun* reporter:

This colony is on the Island of Palawan in the Bay of Puerto Princesa. More than 500 live there in a place fifty miles square, and there is not a guard in the entire place! The prisoners are largely engaged in agriculture. They have their own dwellings where their families may join them. They participate in the local management of the colony. They live a healthful, useful, outdoor life of industry and peace.

And the result?

When a man comes from Bilibid his services are sought after. He is a skilled workman; he gets good wages; he is orderly and law-abiding and is susceptible to discipline. He rarely comes back. He usually becomes a respected and useful citizen and his imprisonment is a badge of efficiency.

All this is ascribed to the work of an American, George N. Wolfe, who was given a free hand in the reformation of the Spanish penitentiary. STUDENT

The Hypocrisy of Affected Incompetence

TOO many excuses are made for stupidity. In nine cases out of ten it is a serious moral defect, and people can help being stupid just as much and just as little as they can help being grasping, or spiteful, or ill-tempered. They have a tendency to mental inertia, and if they do not enjoy, they at least acquiesce in it. . . . They find a confession of stupidity a ready defense against the duty of thought, the onset of scruples, and the demand of the world for sympathy.

People say they are too stupid to understand a question; which means that they know that

the thinking of it out will involve inconvenient results and entail upon them unwelcome duties. They wish to maintain a conclusion which they know to be wrong—to maintain it because it is more convenient—so they purposely avoid thought. Their friends say they have "more heart than head"—foolish friends!

There are people who are always saying foolish things and offending other people. They excuse themselves by claiming a bluff honesty or a childish innocence, and are proud of these attributes, and cherish the intention of offending again; but really these errors could just as well be prevented by a very little care—if the virtues claimed were really the inspiring motives of the person's conduct.

The above is quoted and abstracted from the London *Spectator*, an organ of opinion with which the CENTURY PATH sometimes finds itself in agreement and sometimes not. This time it is in agreement, and adds a few remarks.

The affected stupidity of pretending not to be able to remember, or to pronounce foreign names, or to understand certain arguments, is very common; and when merely an affectation, it is due to the desire of escaping either the trouble of thinking or consequence of admitting. It is really a mean form of deceit. The just way to treat such a person is to relegate him to the class into which he insists on putting himself, and to treat him as being in fact as stupid as he claims to be. The man who forgets should not be entrusted with important duties, nor the man who cannot pronounce long words be allowed to speak in public.

So far we have spoken of the hypocrisy of affected incompetence in the forms in which it is familiarly known to the world. But to the Theosophist, who has been accustomed in his daily life to look deeper into human nature, and who has the key afforded by the Theosophical philosophy, other and subtler forms of this hypocrisy are known. It is possible for a person to have the hypocrisy of affected incompetence so deep-seated that he himself is not aware of its existence. Nevertheless the trained observer may be aware of the fact, and it may chance to be his duty, in the capacity of a teacher, to call the person's attention thereto and help him to get rid of the defect. In this way teachers have often found out that what would ordinarily pass for stupidity in a child or pupil may be really a fault of temper and require treatment as such. There are frequent cases in which an apparent defect of the mental capacity can be shown to be a deep-seated inertia of temperament—not an "I can't," but a determined "I won't"—and can be removed by treating it as such.

An understanding of this fact is the key to a successful dealing with human nature, whether in ourselves or in others. There are so many forms of this self-delusion—to give it a polite name. There is the simple humble man who does not meddle with government and things that are above him, but condescends to permit himself to be looked after. There are the religious folk who leave all to God or the priest or the church. There are the scientific folk who do not meddle with metaphysics. All of us put these limitations on ourselves; and though we fight for them valiantly, yet we are often grateful when we have been shaken out of them. STUDENT

Some Views on XXth Century Problems

Haunted Houses

PROFESSOR Lombroso has decided for himself, apparently without consultation with or permission of the Psychical Research Society, that haunted houses exist. He has investigated ten of them, which he puts in two classes. In the first of these, represented by four of his cases, a particular resident must be present and is the unwitting cause or occasion. In the other the phenomena may go on whether anybody is there or not.

Science is beginning to find out that the body is a battery, productive and storing. The regulated discharge of electricity—which in the case of voluntary muscles is under the control of conscious will—is at the root of all the phenomena of physiological life. Stored electricity, illegitimately escaping *into* the body, in among the muscles, is answerable for the epileptic seizure. Illegitimately escaping *out* of the body, it is answerable for the physical phenomena of mediumship. Even then, however, it takes unconsciously determined paths. Its storage is not in the physical cells, but in their finer, etheric, astral, essence or lining. Science will have to come to the word astral, soon, to distinguish the specialized ether of living bodies from the general sea of what might be called inorganic ether.

The etheric essence of the cells survives their death, the death of the body, for a while; retaining a good deal of stored but slowly dissipating electricity. It is to the remains of such astral bodies that the phenomena of the haunted houses of Professor Lombroso's second group are due. The paths of the force are mostly constituted by things that *have* been done there—bell ringing, table moving and so on. In the case of séances the phenomena (that is, the paths for the force) are usually arranged in the subconsciousness of the medium or sitters.

This is the explanation of Theosophy, which adds that there are stages of electricity behind the one accessible to the present investigations of science. Electricity constantly passes in and out of manifestation, from objective to subjective. That is why it can be guided by will and have its paths traced for it by will. Its escape in mediumship and epilepsy is of course exceedingly exhausting, a performance of one being as detrimental as a seizure of the other. Indeed they often replace each other.

STUDENT

The Man and the Dove

“FOR some little time past,” remarks a well-known English divine, “there has been a disposition in various quarters to introduce a distinction between the Jesus of history and the Christ of religion.”

Here are two or three texts from the *Oracles of Zoroaster* as collected by Franciscus Patricius:

The Father perfected all things and delivered them over to the *Second Mind*, which the nations of men call the First.

Learn the (this) Intelligible, forasmuch as it exists beyond the (thy) mind; with the flower of thy mind it behooves thee to comprehend it.

This Second Mind, the Intelligible, the Logos, the Light that lighteth every man that cometh into the world, the radiation of the Father, was the *Christos* of the Gnostics, a name monopolized by the Christians for one of the long line of humanity's teachers who were teachers merely and precisely because they *had* assimilated it. The moment of his assimilation is marked in the Gospels by the descent of the “Dove,” an incident taken straight from the old Mysteries. For there the final illumination of the candidate was symbolized by the descent of a dove, the fructification of the “flower of the mind.”

The process complained of by Dr. Warschauer will go on. For men are recognizing that the Light of the world is an *impersonal* benediction accessible to all, however few there be that reach it; and it is only after that, that its otherwise incomprehensible Source can be known. In all nations there have been men who became Christs by the assimilation of the Christos. And our reverence for that one of them who has shown us Westerns the old way to the Light he had himself by the efforts and the developed compassion of many births attained, is surely nowise lessened by recognition of the others! Or does that too much affront our egotism?

STUDENT

The Bridge of Light

IT was a fine use to which some of the northern peoples put the rainbow, making it a bridge—of light—or the symbol of a bridge, connecting earth and heaven, and as a bridge belonging therefore equally to both kingdoms. Heaven, the spiritual world, is not easy to conceive of; yet there must be some thought-state, some concept which, beginning where we live, on earth, can have its other end beyond.

We build our final picture of the external world out of the vague feelings of it which in infancy are excited in us by the receivings of the senses. The picture is of course very complex, and much of it at any given moment is quite latent. One of the causes of the sudden gleaming up into relief of some fragment of it, is the electric stimulus of desire. For instance, lying passively in bed the animal desire for breakfast lights up that group of pictures; by contemplating them it becomes stronger, and by that again *they* more vivid. Each reacts on the others, mutually vivifying.

But the brain *can* reflect and store a certain amount of “picturing” of the spiritual world as well as the material. In all people it does so to some degree. But this “picture” is of another order, very faint, its “colors” ethereal, all of it most unrenderable in terms of the physical world, by most people not recognizable at all. Yet progress consists in getting at it and learning it. For spiritually we are most of us infants.

That is the difficulty—to get across into a world that seems no world, only a mere vague feeling however lofty, perhaps mere “piousness.” The faint appeals cannot compete and unless we can find a bridge we are at the mercy of the coarser. To what shall we at-

tach the mind? How shall we climb? Where is the rainbow bridge? We *have* some spiritual desire, but there seems nothing for it to energize into relief. If we could get something for this desire to work upon, there would be the same vivifying interplay as in the case of the other desire and the physical world.

We must take some picture common to the two producing centers of desire and to the two worlds, one which can stimulate desire in both centers, but one which in the lower cannot lead to animal indulgence.

How about *light*? Cannot *both* centers get something say out of the rising and setting sun? There is conscious light in the world, and so it has ever been used as a philosophical symbol, the higher nature seizing on and growing by its spiritually conscious side and the lower its physically illuminative and purely vitalizing. “Spiritual Light” is not merely metaphor.

Then, because one pole of light can be seized by one nature, and the other by the other: the mind, the too often harassed victim of animalism, finds a bridge of conceptive transit. Light is the golden legal tender in both worlds, one face of the coin stamped by one and one by the other. In both poles of human nature it generates desire for itself—at least not impure in the lower and finally redemptive in the upper. Light is the bridge, half objective, half way across changing into the subjective, so landing us into the world which is wholly subjective and of which one can only metaphorically use the world pictures at all.

Another bridge is by way of a pure *feeling*, for example compassion, which, existing in this world and compatible with every moment of life here, passes across into the other without break, having indeed there its real foundation and support.

STUDENT

Food Preservation

A GREAT deal of the food eaten even by people who have access to fresh supplies, is still canned. And there are of course innumerable circumstances under which the use of preserved food is a necessity. The London Local Government Board has therefore caused a chemical and physiological inquiry to be made. It appears that practically all foods, but meats and fruits more than any, take up some of the tin in which they are preserved. This may amount finally to two or three grains of the metal to the pound of food, and any such quantity as this the investigators consider very objectionable, though the exact effects are not yet ascertained.

The practical problem is difficult. Glass can be used, but is not only fragile but apt itself to yield a little lead. But could not *wood*, or even paper, be so thoroughly impregnated with celluloid as to be air and water tight? Powerful compression might do the same; so might pure water-glass. Nor should it be difficult to find a varnish that would be effective and yet add no flavor. Pure nitrogen has been found preservative, and the practical difficulties of its use are but little more than those of sterilization by heat and subsequent sealing. C.

Discoveries in Central Asia

THE discoveries announced by Dr. M. A. Stein, leader of the Indian Government Mission to Central Asia, who has recently reached London after three years' travel, tend to the confirmation of two statements made by H. P. Blavatsky years ago. One is the former existence in Central Asia of a civilization greatly advanced in Sacred Knowledge, from which both the Tibetans and the Indians have derived their sacred lore; and the other is that credit must be given to the Chinese annals.

One of the things he discovered was the Chinese wall, which, according to the Chinese annals, was built in the Second century B. C. to protect their newly opened route towards the west. He traced it for over 300 miles; and in the watch-towers, which occur at intervals, he found many old documents relating to the life of the lonely garrisons in a land which even then (as he surmises) was desert.

But the most remarkable event was the exploration of what proved to be a treasure-cave crammed with ancient manuscripts, paintings, and "other Buddhist remains." They had been hermetically walled up, towards the tenth century of our era (as stated), evidently to save them from a threatened barbarous invasion. They dated back as far as the First century A. D.; though we must accept this date with caution as possibly not being the oldest, in view of the further statement that it was quite impossible to make a thorough examination. The manuscripts were done up in bundles and were practically as fresh as when deposited. Their number exceeds 4000. They are "*as far as can be told, approximately in about seven different languages*"; and the triple qualification expressed in the words we have italicized leaves ample room to speculate whether the number might not be seventeen or seventy, and whether the convenient term "Buddhist" will describe all of them.

When we consider the very inchoate nature of such explorations, we can realize that what has so far been found may well be but the prelude to much more extensive and important discoveries, such as will fully confirm the assertions of H. P. Blavatsky; more especially when we also bear in mind that archaeological discoveries always favor ancient traditions and chronicles rather than modern theories.

In *Five Years of Theosophy*, p. 154, we find a writer saying:

It is extremely difficult to show whether the Tibetans derived their doctrine from the ancient Rishis of India, or the ancient Brāhmins learned their occult science from the adepts of Tibet; or, again, whether the adepts of both countries pro-

Lomaland Photo. and Engraving Dept.

ROCK-CUT TOMBS AND MODERN VILLAGE In the Northern part of Asia Minor

fessed originally the same doctrine and derived it from a common source.

To which H. P. Blavatsky appends this note:

To ascertain such disputed questions, one has to look into and study well the Chinese sacred and historical records.

Is not this important in connexion with Stein's discovery of the wall? And she continues:

A people whose era begins nearly 4600 years back (2697 B. C.). A people so accurate, and by whom some of the most important *inventions* of modern Europe and its so much boasted modern science were anticipated—such as the compass, gunpowder, porcelain, paper, printing, etc.—known and practised thousands of years before these were rediscovered by the Europeans, ought to receive some trust for their records. And from Lao-tze down to Hiouen-Tsang their literature is filled with allusions and references to that island and the wisdom of the Himālayan adepts.

And she quotes from the *Catena of Buddhist Scriptures from the Chinese*, by the Rev. Samuel Beal, in which there is a chapter on the Tian-Ta'i school of Buddhism, in the rules of which occurs the sentence: "That which relates to the one garment (seamless) worn by the great teachers of the snowy mountains, the school of the Haimavatas." And another rule relates to "the great professors of the higher order who live in moun-

tain depths remote from men."

The island mentioned is one that existed in times when much of what is now land was sea; and the locality of this island is said to still exist somewhere in Central Asia. To conclude with another quotation from H. P. Blavatsky:

The gigantic unbroken wall of the mountains that hem in the whole table-land of Tibet, from the upper course of the River Khuan-Khé down to the Kara-Korum Hills, witnessed a civilization during millenniums of years, and would have strange secrets to tell mankind. The Eastern and Central portions of those regions . . . were once upon a time covered with cities that could well vie with Babylon. A whole geological period has swept over the land, since those cities breathed their last. . . .

Within those table-lands of sand there is water, and fresh oases are found blooming there, wherein no European foot has ever yet ventured, or trodden the now treacherous soil. Among these verdant oases there are some which are entirely inaccessible even to the native profane traveler. . . . Built deep in the bowels of the earth the subterranean stores are secure; and as their entrances are concealed in such oases, there is little fear that anyone should discover them. (*The Secret Doctrine*, vol I. p. xxxii.) STUDENT

The Ruins of Selinus

IN reference to Sicily and its earthquakes, the following from F. Marion Crawford's *The Rulers of the South*, is interesting. It seems that among the ancient builders of gigantic buildings we must include the Greeks, who are

not usually thought of in connexion with massiveness. To state that they had not our modern resources in steel construction and machinery is to render their achievements still more wonderful.

It was between 480 B. C. and 409 B. C. that the great temples of Selinus, of Segesta, and of Akragas were built, edifices which surpassed in size and solidity almost every building of the sort in the Greek world. There is nothing in Europe like the ruins of Selinus. Side by side, not one stone upon another, as they fell at the earthquake shock, the remains of four temples lie in the dust within the city, and the still more gigantic fragments of three others lie without the ruined walls. At first sight the confusion looks so terrific that the whole seems as if it might have fallen from the sky to the world. . . . Blocks that are Cyclopean lie like jackstraws one upon another, sections of columns twenty-eight feet round are tossed together upon the ground like leaves from a basket, and fragments of cornice fifteen feet long lie across them or stand half upright, or lean against the enormous steps. . . . One touches the stones in wonder, comparing one's small human stature with their mass, and the intellect strains hopelessly to recall their original position; one climbs in and out among them, sometimes mounting, sometimes descending, as one might pick one's way through an enormous quarry, scarcely understanding that the blocks one touches have all been hewn into shape by human hands and that the hills from which men brought them are but an outline in the distance.

It would seem that there is still much to be learned, even about classical times, let alone those that preceded them. E.

✻ The Trend of Twentieth Century Science ✻

How Old is the Earth?

GEOLOGISTS seem to think they have data enough to solve this question, and even to look ahead and say about when the earth will die—that is, cease to be a possible home for life.

Even guesses must of course restrict themselves, in their backward view, to the time at which geological conditions are assumed to have become something like what they are now. The years occupied by the young globe in cooling down to that, must be left as x .

As soon as there was water, there began to be sedimentary rocks, rocks deposited from solution. The rate of deposition being assumed to be about an inch per century, and the depth of deposited rocks being assumed to be about one hundred thousand feet, the figures come out as about one hundred and thirty million years. If the sedimentary rocks are three times as deep as that minor estimate, the period comes to five hundred million years.

How about the future? It is very gloomy. The hot fluid nucleus is contracting as it cools; the shell crumples in after it; the sides of the crumple become mountain ranges; each great subsidence, the submergence of a continent, bulges out a new continent from beneath the water. But the see-saw gets less and less; the time is coming (according to the theory) when the water will have eaten up the last mountain and continent, and any upheavals that may occur will not be marked enough to bring new ones above the surface. There will be no land for us to live on, and the surface would be too cold if there were. And this condition is about as far ahead as the beginning of sedimentation is behind. In other words, the earth, considered as our home, is in vigorous middle life.

This is the picture given by the geologist Dr. Alexander Roberts, as representing fair deduction from what we know.

But do we know enough to say so much? The two legs of the theory are, first, the uniformity of the constitution of matter through millions of years; secondly, the cooling and contracting nucleus with the deserted crust falling in upon it.

Yet we know matter to be changing its constitution. Where is a molecule of uranium, there *will* ultimately be instead another metal, radium; the radium in its turn will ultimately be helium, lead and perhaps many other metals. The consideration of the atomic weights shows evolution among what we call the elements. One hundred million years hence, or ago, the matter of the earth and its chemical and physical processes may be, or have been, very different from what they are now.

About the nucleus of the earth we know very little, perhaps its mass and density. We do *not* know that it is hot and cooling. The heat we find in the crust can be, and has been, accounted for by the presence of less radium than we know to be present in the accessible depths.

An earthquake is a little bit of readjustment. Crust movement is or has been taking

place. But earthquakes, on good evidence, are being increasingly credited to the sun and connected with the movement of spots. The great crust waves that sink a continent here and bring one up there may also be due to the sun and *not* to the hypothesized cooling nucleus.

The same geologist remarks:

Progress from the lowest primitive stages of life to the highest complex types of the present day has been gradual and regular. There is not in creation a single reversion of development—that is, a distinct descent from a highly organized form to a simpler and more rudimentary type. Retrogression is apparently a manifestation of nature in its sick and feeble moods. Life unrestricted moves forwards in a stately fashion, ever facing the line of march.

Does it not occur to him that the earth exists *in order that* life unrestricted may move forward, and that to whatever splendid developments it moves, the conditions of the planet will favorably correspond?

The movement is by means of variations. The biological problem for the immediate future is these variations: are they at random and in any direction, or do they as a whole point upward? If the latter, as biologists are beginning to think, then nature is not designless and mechanical—and “nature” includes the planet itself.

STUDENT

Meta-Physics in Science

“**T**HE metaphysical entity called a cell,” says an English biologist who does not seem to mind jarring the nerves of his colleagues.

It is that, and the physical entity is only because of the other, ceasing to be that when the other is tired out and becomes demagnetized of its vitality. “Some men believe in vital force,” says Professor Starr Jordan, “because they come into contact with phenomena explainable through no other force. Others reject vital force, because the existence of such a force is inconceivable. And so it is, and equally inconceivable is its non-existence.”

Science had better get to work conceiving this “inconceivable.”

Why do crystals form? Why do the composing molecules arrange themselves in that way? Is there a compelling plan? Or is it merely the polarity of the molecules? But how did they get that particular kind of polarity? Perhaps from the arrangement within them of the corpuscles of which they consist. But why did the corpuscles arrange themselves in that sort of molecule in that special way? You can not get on at all without postulating an ideal magnetic plan on another plane. It is on another plane because as the arranger of matter it cannot be itself of the same matter. Anyone who will think back far enough into the necessities of the case will find that it must be also subjective.

The only man who has hitherto done much in our time with the idea of vital units, standing to the cell as the molecule to the crystal, is Mr. Butler Burke of “biophore” fame. Aggregate his biophores, and then aggregate

the aggregations a sufficient number of times, according to an ideal plan, and a cell results. But the ideal plan must be regarded as a functioning metaphysical entity, ultimately getting exhausted, needing rest, and gradually retiring. Then the biophores, liberated from this control, become anarchic; the cell begins to die. Destructive bacteria—new aggregations of these same biophores—make their appearance.

In this connexion the phenomenon of phosphorescence becomes suggestive. Phosphorescence of animal and vegetable matter does not always mean its death. So far as we know, phosphorescence *does* always mean the presence of bacteria, but in the case of many insects and fish the bacteria are servants engaged in the life of the animals they haunt. The light attracts prey, enables its possessor to see prey and environment, and may frighten some enemies. The emitting bacteria are tenants within the cells of the host whom they thus serve. If the theory is correct we have one more species or set of species to add to our short list of known bacteria which serve.

But there may be many more, nevertheless, within every cell that the microscope looks at. In the first place they may be refractory to stains and therefore invisible. Or they may be too small. We know that there are organisms beyond the limit of microscope vision. And thirdly they may be so little independent as to be *working parts of the cell itself*. For instance the fragments of the thread or skein of which the nucleus under certain conditions shows itself to consist, may be so to speak harnessed or associated—or not yet dissociated—bacteria. Science has already been compelled to think of the germ plasm as a grouping of infinitely minute units. Let the same conception be carried out for all cells.

STUDENT

Nature-Mind

A CORRESPONDENT of an English scientific paper relates that

In a British Colony, some fifty years ago, some Shorthorn cattle escaped into the dense and almost impenetrable brush and scrub which covered the country, and there lived and bred in an absolutely free and wild condition. The descendants of these animals are today entirely hornless, because Nature, finding that the horns impeded the animals in flight, or in their search for food, suppressed them.

He fails to tell us a very important fact: Was the disappearance of the horns sudden or gradual? But considering that so marked a change came about in so short a period as fifty years, it may be anyhow called sudden. It is a case for Professor de Vries. For “sports,” sudden variations to no-hornlessness must have appeared, constituting a new species. Mere Natural Selection could not have worked so quickly, especially as on the other side the horns had their use in conflict.

The correspondent spells Nature, perhaps without thinking, with a capital N. Is he suggesting conscious design and intent as a formative factor? If biologists would recognize that, even if they did not call it Pan, they would find some problems much easier. C.

The Alaska-Yukon Pacific Exposition

But more in you than these, lands of the Western shore,
(These but the means, the implements, the standing-ground,)
I see in you, certain to come, the promise of thousands of years, till now deferred,
Promised to be fulfill'd, our common kind, the race.—*Whitman*

A CIRCULAR from the publicity department of the Alaska-Yukon-Pacific Exposition states that it is expected to open on May 1, a month before the stated time. Nearly all the principal structures are completed and ready to receive the exhibits. Its magnificent auditorium is ready, with its thousands of seats; the Fine Arts Palace awaits its treasures; the Forestry Building is of unsawed fir logs. These, with the machinery building, will be permanent and will revert to the University of Washington after the fair is over. Oregon and California have been lavish in the construction and beautification of their buildings. Canada appropriated \$100,000 for building and exhibit; but, as the exhibit will be the same as that already used for the Franco-British Exposition, the bulk of the fund will go towards the building. Among other places named as being busy getting ready are: Spokane, Yakima, King County; British Columbia, Alberta, Saskatchewan, Yukon; Massachusetts, Iowa, Nebraska, Illinois, Colorado, Idaho, Texas, South Carolina.

The trend of a new cycle is indicated by the sympathy shown by this far Western domain with its neighbors across the water—the far Easterners; for an Oriental touch will be given by the presence of the Indian elephant and the camel amid the haunts of pleasure and instruction at the Exposition. There will be an Oriental village, with huts, cosy corners, smoking and tea rooms, theaters, mosques and shops. The front of the Oriental village is a combination in its architecture of Turkish and Egyptian, and immense pylons will mark the way to this region. Just inside the streets of Cairo is a large plaza leading up to a towering minaret,

Lomaland Photo. and Engraving Dept.
YOSEMITE VALLEY, CALIFORNIA

from the top of which a muezzin will daily summon worshipers. This will introduce a parade of many nations.

In reflecting on the utility of all these expositions in breaking down national barriers, one is reminded that they are one and all due to the initiative of a great and good man; a king who, denied participation in actual politics, yet found occupation for his abounding beneficence and rare foresight in inaugurating many enterprises that have since vindicated his judgment by blossoming forth into usefulness: Prince Albert of Saxe-Coburg Gotha, in short, consort of the late Queen Victoria, who planned and executed the first great international exposition in London in 1851, which may justly be regarded as a historical event, so greatly did it promote progress and enlightenment.

May the work thus started grow and unfold into yet undreamed of benefits for the nations, and play a prominent part in the wonderful enlargement of thought which we are now witnessing. And may the present Exposition do much to confirm our newly acquired sense that East and West are necessary to each other. Let us heed not the croakings of those who try to stereotype existing disabilities by prating about the incompatibility of races. Let us have more faith in the possibilities and developments of the future and allow room in our plans for growth.

Conservation Congress at Seattle

THE first conservation congress for all of the Northwestern states ever held in the United States will take place August 16, 17, 18 in the auditorium of the Exposition. Arrangements for entertaining 1000 delegates have been made; the governors of all the states will be asked to attend; and it is expected that this will be the greatest convention of its kind excepting Mr. Roosevelt's recent Congress of Governors. We can thank God on Thanksgiving Day with a clearer conscience if we have put our own shoulder to the wheel meanwhile. E.

SOME LIFE OUTLIVED OF YORE

A prescient lore

Springs from some life outlived of yore.
O swift instructive startling gleams
Of deep soul-knowledge; not as dreams
For aye ye vaguely dawn and die,
But oft with lightning certainty
Pierce through the dark oblivious brain
To make old thoughts and memories plain;
Thoughts which perchance must travel back
Across the wild bewildering track
Of countless aeons.

Paul Hamilton Hayne (Selected)

The Age of Personalism

THIS is an age of personalism. We demand a personal God, subject to very human whims and caprices. Our prayers are personal, our aspirations, our ideals of eternal salvation—all are personal; and withal they do not satisfy us. They do not bring happiness. Humanity will never thus achieve its destiny; it must forget its separate personalities and reach for help for the solution of all its problems to its oneness with all that lives.

Christian theology tells us that man has a soul, which he stands in constant danger of losing. No matter what his life has been, by a simple act of faith alone he may save it. This Being who creates him only to damn him may save him or not as he thinks best. He projects him into earth-life without his consent. He creates man in his own image and leaves him suspended between heaven and hell for the space of one short life, which is as a moment of time in eternity. At the end he sends him out for judgment and sentence; eternally damns him, or at the best allows him to sing paeans of eternal joy that he was not damned. Still there is one doubtful comfort—his suspense is over and his fate is fixed for all eternity.

Theosophy says that man is divine. He enters earth-life because he himself has set in motion the causes which lead him to re-birth. He dies in accordance with the cyclic laws of his being, but now how much too soon, because by his life he has brought into action the causes which lead to dissolution and he has either no knowledge or no desire to set in action causes which would counteract them and enable him to live out his full term. This calls for a belief in Reincarnation, or the living of many earth-lives by man. When we look at all the problems of life, social, political, moral, and religious, which confront us on every side, Reincarnation and its twin belief of Karma help us to find the meaning of them all.

The common cry of humanity which we hear voiced so often in "Oh, if I had my life to live over again!" "Oh, if I could finish my work before I go!" gives us one of the chief reasons why man does return to earth-

life so persistently. He wants to. He desires it with a longing which is satisfied only when he has gained all the knowledge which the experiences of earth-life hold for him.

Man being divine has the divine knowledge of life, which his outer personality obscures and hides so that man as we know him is a half-asleep giant, with only part of his senses developed, groping in a world he thinks is real, but which is really made up of his own vast mistakes.

In one earth-life how often do we see the good go unrewarded and the evil prosper. The world seems filled with injustice and inexplicable inequalities. Yet in the light of Reincarnation they smooth themselves out. What has need of straightening-out has another life, or perhaps many lives to run, but as sure as day follows night it will be straightened out, for perfect justice rules the world.

Christianity states that man is placed in his present environment by a Supreme Being; that the extent of power of will and mind and soul given him are measured out by this Being; that any talents he may have are granted him as a favor by this Being and he must be accordingly thankful. According to the literal interpretation of the Bible this Being is represented as capable of anger and jealousy and pride. His anger may be appeased and he may be propitiated, and if properly addressed, he will grant favors to his chosen few. Is not this conception of Deity belittling both to Deity and to man himself?

Theosophy teaches that there is a Supreme Spirit, boundless, perfect, limitless; that the Supreme Spirit is mirrored in man, and that man is divine in his origin, master of his own fate; that that which he sows he reaps. If he sows discord, he must reap the result in this life or another. He meets perfect justice in this life or another. There is no such thing as chance. Either in this life or another we have set in motion the causes of that thing happening to us which we say was a chance happening. We take the train which goes over the embankment, and perhaps we may see the reason for it as we pass into the light of the hereafter, but it was not chance or luck. There is no such thing. In this life or a former one we built for ourselves the quality of brain-mind which could not listen for the warning of the inner self, which knows ahead of the brain-mind even the tiniest and least important thing which will happen to us. We have cut ourselves off consciously and of our free will from that power we call instinct, which works for personal safety, that even the wild animals possess, and from the higher, spiritual power of intuition. We smile or sigh, and lay the burden of our wilful ignorance on Providence, or fate, or chance.

We attribute disease or calamity to various causes and some races or nations attribute them to the anger of the Gods. They may be the result of physical, mental, and moral causes set in action in a former life by the nation or community which now suffers them.

Let us take an example: a certain man falls just short of success in every thing he undertakes. He is a good man, as the world considers goodness. He is honest and upright, but he is never quite successful. We pity him and marvel and think it is his luck. But there is no such thing as luck. May he not have spent a lifetime somewhere, sometime, in the

past, falling short of the best he was capable of, and the result is now working itself out.

The law works ever for harmony. It knows no favor, no injustice. What we sow we reap, now or after many lives. If we wrest his goods from our brother we but prepare a sorrow for our future experience. If we neglect to develop the powers we have, we are but forming our future limitations. But if we learn the truth of the Brotherhood of Humanity, and make it a living power in our lives, we are helping to make a clear atmosphere for ourselves in the future.

If humanity would but realize the existence of this law and apply its workings to the solution of its daily problems, we should find a great change in the standards of conduct both in public and private life. Responsibility and duty would have a deeper meaning, and that we are our brother's keeper would become a living truth instead of a dead letter. We should come to realize that those who hold in their inmost nature the weakness which leads to the gratification of personal sensation or desire, either mental, moral, or physical at the expense of another are storing up for themselves a harvest of like results which they themselves must reap. They are preparing for their own experience the day of agony and shame they have meted out to another.

And what of those who suffer? Theosophy teaches that in the spirit in which they meet their lesson lies their way to freedom from experiencing it again. In exact proportion as they learn to accept it as a lesson and get from it what it holds for them, as they grow to better things under the stress and strain, shall they measure their emancipation from that phase of earth-life.

If they accept it in bitterness and rebellion; if they fail to see its true import for themselves; just so much shall it still hold them. If they allow it to warp their natures, and stop their spiritual growth, they but bind the lesson to them for future experience.

If mankind would but realize the law as acting ever for harmony, ever for good; if they could realize their own divinity, how soon might the world be made new! As there is no separateness from the race for us, its progress is our progress; its degradation is ours. Every pure and noble thought and act we cause to go forth into life shall return to us in the uplifting of our race. E. M.

SOCIAL differentiations, the result of physical evolutions and material environment, breed race hatreds and sectarian and social antipathies that are insurmountable if attacked from the outside. But, since human nature is ever identical, all men are alike open to influences which center upon the human "heart," and appeal to the human intuition; and as there is but one Absolute Truth, and this is the soul and life of all human creeds, it is possible to effect a reciprocal alliance for the research of and dissemination of that basic Truth. We know that a comprehensive term for that Eternal Verity is the "Secret Doctrine"; we have preached it, have won a hearing, have, to some extent, swept away the old barriers, formed our fraternal nucleus, and, by reviving the Aryan Literature, caused its precious religious, philosophical, and scientific teachings to spread among the most distant nations.—H. P. Blavatsky, in *Lucifer*.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question If you claim that the Bible teaches Reincarnation, how do you interpret *Hebrews ix. 27*: "It is appointed unto men once to die, and after that the judgment"?

Answer The claim is that the Bible teaches Reincarnation, or rather that Reincarnation is taught in the Bible; and so you will find it to be. But you are confusing the old orthodox ideas about the Bible, with those that may be held by students of Theosophy.

These latter have never asserted that the Bible is one sacred book from cover to cover; nor do they stand or fall by anything that may be found in it! A text is divinely inspired, when it is divinely inspired, and for that reason; not because it is to be found in such and such a book. The Bible is a literature, a compilation of books, and some of them are sacred and some profane.

I wish we could see what a dignity rests with the soul of man; and that wherever it speaks, *there* is sacredness and the precincts of the Holy of Holies. For we have no gateway nor communication with the heavens except through our own souls. The Universe is all symbol, and the infinite jewels of color with which it is adorned, and the majesty and splendor of things, are but effusion and blossoming out of the divine. Life is leaping and surging and flaming through all things, and this life is eternal, irresistible, deific. Could we tear off the cover of things, or slough the blindness we hug and love, we should be overwhelmed with terror and delight, confronted perpetually with exultant, bewildering beauty. For the core of the Universe is that: do but live by the Law, and what pessimism shall have power to approach you? As it is said: "Blessed are the pure in heart, for they shall see God."

And why shall they see him? Because within is our only window into infinity. The soul is slumbering there; it is a kind of Janus, one face beholding the ineffable, one turned towards the affairs of this life. We might approach it, but that our eyes are glued to the pother and rout of desires and passions. We permit too much noise and scramble within ourselves; instead of infinity we are concerned with longings and fears that ought not to have weight with beings of the dignity of man.

Our attention is withheld from the deeper reaches of our nature, or else we should be nourished with all beauty and wisdom. Whoever speaks of a dead universe, atoms hurled together by chance, and life springing up inconsequentially and without design, is merely a fool. He has gone to search for jewels in a dunghill where no jewels are, and all the microscopes and crucibles in the world shall not aid him. The Universe is resplendent and magnificent, a pageantry and play of celestial hosts; a warfare of gods upon devils, wherein you, too, willy nilly, take sides at every turning of your life. The earth is alive and conscious, and the morning stars are still singing together; the hills are still peopled and melodious, and we ourselves might go hand in hand with the living gods. The whole question rests on this — whether we will arouse ourselves, and stand as souls.

That book is sacred that is the fruit of soul dominance in a man. Divine inspiration was not for one age or land only, but is universal and for all time. You shall know sacred scripture by what it contains. Can it awaken in you stirrings of a vaster and more compassionate life? It has the right then to be called holy writ. For the pure in heart *shall* see God: and proclaim their vision, too; if they have pitted their purity against, and stood up for the glory, they have earned the right to behold. Let us have a broad and common-sense basis for our philosophy; let us not fashion idols in the brain, nor bow down (a thing worse still) to idols that others have so fashioned, but watch and follow the grand motions of life. Cowards and fledgling-souls and the indifferent may lounge down upon a dogma; it will carry them, they think; no deep energy is called for to shout and quarrel in its defense. But we have to depolarize ourselves of these things, or we shall never be grown men. We have to approve scriptures for the truth that they contain; not truth because it may be included in this or that scripture.

So then, there may be a thousand and one ways of accounting for such a text as this one in the question, and it may call for no more interpretation than the most commonplace dogmatizing from the pulpit of any modern conventicle. Much was added to and much taken away from, the Jewish and Christian sacred ideas by Eusebius and men of his stamp among the Church Fathers. For that was a time when priestcraft was paving its way towards domination over the minds of men; and the teachings of Jesus and his immediate disciples must be emasculated or perverted, or they might yet have some power to save souls. Fragments have been left to us, to show us the quality that these teachings once had, and the salvation that was in them. "Ye are Gods, and the Spirit of God is within you" — a God will not give over his soul into priests' hands, if he is aware of his godhood. If after death we are to be judged finally, and sentence passed for all time not much is left to ourselves; we shall be ripe for bribing anyone who can convince us that he has influence with the court. Let us make bold to say at once, that in the light of intervening history, it would be unlikely if the Bible were not strewn with texts that were put there deliberately to rob men of their vigor and valor, and weaken them and hide away from them the true light of their souls.

M.

Answer II. The saying "It is appointed unto men *once* to die," may be rejected immediately as being contrary to the teachings of Theosophy. And it is well here to say that the idea that some people have, that the truth of Theosophy is to be tested by isolated statements from the Bible or other sources, and very often by mere opinion, preconceived notions, is a totally wrong position to take. It is as though one would test the light of the sun by the artificial lights we have in our houses, by our candles, oil lamps, and rushlights, not realizing that all the light that they can give comes ultimately from the very sun whose right to exist we presume to question. And so it is with Theosophy, and the opinions and theories of men, as well as with all the teachings, great or small, that are

to be found in the scriptures of the world; what of the truth and light they have is derived ultimately from Theosophy, the *Wisdom-Religion*, the fount and source of the world's religions, and as expressed by H. P. Blavatsky in *The Key to Theosophy*, "the last possible word of human knowledge." It is thus by Theosophy that their truth is to be tested and not *vice versa*.

And so it is with reference to "*once* to die," and we must reject it as being contrary to the universal fact, in regard to man, of Reincarnation; that is of many lives, and consequently of many times dying and as many rebirths.

But what of the statement, that after death comes the judgment? The sense conveyed is that of an immediate judgment after death, and to any orthodox Christian who brought up this statement as contradictory of the teaching of Reincarnation, we should be perfectly justified in calling his attention to the fact that it was contrary to the orthodox teaching of a final "judgment day." But that may be passed by. Does Theosophy teach that judgment takes place immediately after death? Yes, in a sense, but so too, in a sense, there is immediate judgment at the very instant of the performance of every act, and the thinking of every thought; and one does not have to wait until one's present life is over and death comes. The teaching is that the result inheres in every act, and is inevitable though it may not manifest until a succeeding life; just in the same way that the full tree is contained potentially in the seed, though the seed may be laid away for years, and will not germinate until it finds suitable soil and other needed conditions.

But in another sense there is also a judgment after death, for one may not realize, and too often does not, the result that will follow from his acts; but at the moment of death, according to the teaching of Theosophy, the soul passes in review the whole of the life just closed. And the full significance of this cannot be understood unless we realize that by soul in this connexion we mean the immortal Ego, of which we catch but faint and rare glimpses in the lives of most people here on earth. It is not the personal Ego, with its imperfect knowledge and dim sight, unable to see the due relation of things; but the true Higher Ego which has knowledge and which sees things in their true light and the results that must come.

William Q. Judge has written:

The breath leaves the body and we say the man is dead, but that is only the beginning of death; it proceeds on other planes. When the frame is cold and eyes closed, all the forces of the body and mind rush through the brain, and by a series of pictures the whole life just ended is imprinted indelibly on the inner man not only in a general outline but down to the smallest detail of even the most minute and fleeting impression. At this moment, though every indication leads the physician to pronounce for death and though to all intents and purposes the person is dead to this life, the real man is busy in the brain, and not until his work there is ended is the person gone.

"And after that the judgment," yes, and man, the real man, the true Ego, is himself the judge in his knowledge of and acquiescence in the working of the law. From the text quoted, take out the word "*once*," and then in the light of Theosophy the statement is full of meaning.

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

Death and Immortality

WE speak of death as a great unsolved mystery, and all through the range of currently accepted literature we find it regarded as a mystery and we find all kinds of beliefs as to what lies beyond it. But we must remember that what we call the historical period is in reality a part of the *Kali Yuga* or Dark Age, during which the deeper knowledge of life had faded from the general memory. Hence, to find the evidences of a greater knowledge concerning this mystery, we must either probe the symbology of veiled esotericism or go back to earlier ages.

There have been times when men realized that the mortal self or personality was not the real Man, and that its disappearance at death was only a transformation and a natural recurrent phenomenon in the life of the immortal Self. Then they did not think so seriously of death as do we who know so little of that greater life. As a race we may at present stand a considerable distance from the attainment of such knowledge, but nevertheless we should hold it before us as an ideal; for we are bound to hold some sort of an ideal, and at present we are hypnotized with the doctrines of theology. These doctrines forbid us to think of the possibility of a future career among the experiences of earth-life, and thus limit our aspirations and hold back progress.

Hence the great importance of the teaching of Reincarnation. It is nearly impossible for the details of this doctrine to be discussed, because people are not ready for them and would turn the teaching into all kinds of fantastic shapes. For instance, they would imagine that Reincarnation implies the perpetuation of their personality with its foolish desires and delusions, and that it teaches the previous existence of that shifting personality. Already, since the doctrine was reintroduced to the Western world, we have had instances of people professing to recognize their past incarnations and making this claim the basis for indulging vanity.

But the truth is that the immortal thread in our life lies too deep to be reached by the unpurified mind; and to reach it, we must first destroy that concentered tangle of delusions that goes to make up our personality. But this means a self-purification and self-sacrifice such as we can hardly conceive. He who would attain to the knowledge of immortality must

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

regard his own personality and other personalities in the same light, and must practically forget who he is. Any personal bias or cherished personal desire would immediately recreate the delusion, destroying his knowledge. Therefore it cannot be believed that anyone talking thus lightly about his past lives really remembers them; for the fact of his genuine remembrance would imply that he was initiated to an extent to which his other attributes forbid us to believe, and which would almost certainly preclude him from speaking about the matter at all.

But we may all hold the truth of Reincarnation as an ideal, in place of the illogical and injurious doctrines now current. For the beginning of attainment is aspiration; and by recognizing the existence of the Soul within, we set out on the path that leads eventually to its realizations. Under its present teaching, however, no sooner does anyone get a glimpse of the Divinity within than it is immediately labelled "Jesus" and he is switched off into the theological siding. One church has a whole system of "guardian angels" provided to account (on theological lines) for any revelations people may have, and so keep them from apprehending the real significance of those revelations and profiting thereby.

Yet, important as it is to speak of the Divinity within, it is also dangerous; for, as too common experience shows, people in their ignorance and vanity are too ready to accept a neurotic emotion as a manifestation of divinity, and to deify a mere exaltation of their personality. It is essential to bear in mind that the Divinity manifests itself in self-forgetfulness and modesty, causing the personality to sink into the background and shun the observation and praise of men. Could we but regard personality as an instrument merely, of a greater consciousness within humanity seeking ever to illumine and inspire it, many mysteries would yield up their secrets. Unselfish service fired by universal thought can render life and death translucent.

The Theosophical Society Celebrates its Twentieth Anniversary in Sweden

AN anniversary in the history of the Theosophical Society was celebrated yesterday by the Universal Brotherhood and Theosophical Society, twenty years having passed since the establishment of the society in Sweden. The mem-

bers attended in a body at the meeting, which derived a special character of freshness and life from the presence of representatives of the young people's departments. The members of the Boys' Brotherhood Club were dressed in their neat uniform with belts in the Swedish colors, and the Girls' Club for Higher Education formed a very graceful group in white and flowers. The greatest attention, however, was attracted by the children, who, dressed in the Greek style and adorned with flowers, occupied the seats of honor on the platform. Besides the young, over one hundred persons were present, among whom were Dr. Gustaf Zander, Mrs. C. Scholander, Mrs. A. Cederschiöld-Sterky, and others of the oldest members in the Society.

The meeting opened with music, during which the children entered, placing flowers on the pictures of the three Leaders, H. P. Blavatsky, W. Q. Judge, and Katherine Tingley. When the music finished, Dr. Zander in affecting words pictured his feelings, especially his joy at seeing so many young people, the best proof of the life and possibilities of the Theosophical Movement. After other speeches by the older members, Mr. von Greyerz spoke on behalf of the young, thanking the old, especially Dr. Zander, to whom all Theosophists in Sweden were indebted for his pioneer work as president of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY in Sweden. A tasteful address was read, being a greeting from the Swedish centers to Mrs. Katherine Tingley, Point Loma. The children read telegrams from the different centers. The anniversary meeting was concluded by music and quotations from H. P. Blavatsky, W. Q. Judge, and Katherine Tingley.—*Svenska Dagbladet*, Stockholm, Feb. 11, 1909

WHAT I do not wish men to do to me, I also wish not to do to men.—*Confucius*

The Theosophical Address at Isis Theater

OWING to an unusually stormy evening, the usual Sunday evening meeting at the Isis Theater, San Diego, was postponed until the Sunday following.

The Example of China

THE Shanghai Opium Commission has finished its work and tabled the results in nine resolutions.

The first recognizes the sincerity of the Chinese Government in its attempts to suppress opium smoking.

The second delicately suggests that other countries should imitate China.

The fourth suggests that countries which have regulations restricting the import of opium should have some more regulating its export.

The fifth calls attention to the ever advancing *morphine* evil and recommends drastic measures.

The sixth urges further scientific study not only of opium but of anti-opium remedies, the eighth commenting further upon anti-opium "remedies" which contain opium—not few, these; and to them should be added those that contain the worse fiend cocaine.

The seventh and ninth urge Governments having concessions in China to close opium divans therein, and to apply their own pharmacy laws to their subjects therein and in their Consular Districts.

There is no reason why throughout the civilized world opium should not be officially followed from its production to its consumption, so that all along the track there should be no leakage for debauchery. Fortunately there will be no pernicious medical voices declaring that its "moderate use" is beneficial. M. D.

WITHDRAW into yourself and look. And if you do not find yourself beautiful as yet, do as does the creator of a statue that has to be made beautiful; he cuts away here, he smooths there, he makes this lighter, this other purer, till he has shown a beautiful face upon his statue. So do you also: cut away all that is excessive, straighten all that is crooked, bring light to all that is shadowed, labor to make all glow with beauty.—Plotinus

THE second assertion of the Secret Doctrine is the absolute universality of that law of periodicity, of flux and reflux, ebb and flow, which physical science has observed and recorded in all departments of nature. An alternation such as that of day and night, life and death, sleeping and waking, is a fact so common, so perfectly universal and without exception, that it is easy to comprehend that in it we see one of the absolutely fundamental laws of the universe.—H. P. Blavatsky

VIEWS OF OLD NÜRNBERG

The Ages of Man

A WRITER in the *Hartford Times*, on ancient Britain, quotes Sir Humphry Davy, who besides being a great and intuitive scientist was a Cornishman and a poet, to the following effect:

On the sea

The sunbeams tremble, and the purple light
Illumes the dark Bolerium, seat of storms.
High are his granite rocks; his frowning brow
Hangs o'er the smiling ocean. In his caves
There sleep the haggard spirits of the storm.
Wild, dreary, are the schistic rocks around
Encircled by the wave, where to the breeze
The haggard cormorant shrieks; and far beyond,
Where the great ocean mingles with the sky
Are seen the cloud-like islands, grey in mists.

The writer then goes on to give an account of the conjectured occupation of Britain by the various races called the people of the Stone Ages, the Bronze and Iron Ages, and the various migrants from Europe. Some of these races are believed to have been crowded into Cornwall, among other outlying parts, by more powerful races who occupied the more fertile regions. And in Cornwall they lived a life isolated and distinct from the rest, and the country still preserves the relics of their buildings. Conan Doyle is also quoted:

The strange thing is that they should have lived so thickly on what must always have been most unfruitful soil. I am no antiquarian, but I could imagine that they were some unwarlike and harried race who were forced to accept that which none other would occupy. . . .

The longer one stays here the more does the spirit of the moor sink into one's soul, its vastness and also its grim charm. When you are once out upon its bosom you have left all traces of modern England behind you, but on the other hand you are conscious everywhere of the homes and work of the prehistoric people.

On all sides of you, as you walk, are the homes of these forgotten folk, with their graves and the large monoliths which are supposed to have marked their temples. As you look at their grey-stone huts, against the scarred hillsides, you leave your own age behind you; and if you were to see a skin-clad hairy man crawl out from the low door, fitting a flint-tipped arrow onto the string of his bow, you would feel that his presence there was more natural than your own.

And Eden Philpotts is also quoted to the effect that—

All is unchanged; and here, at high noon, I see their ancient lodge still lying in the heat between great hills. The huts are roofless, and the domes that rose above each stone foundation have disappeared. Time and man have broken their outer walls, and all that could perish of them has passed with the blue smoke that aforetime curled above each edifice; but their environment endures in a robe of many colors. . . . And seeing the stones scattered here so harmonious, so solemn, and so still, my heart goes out to those vanished shepherds, and I love them across the dark waves of time that roll between their pilgrimage and my own.

And so on with much more which space forbids quoting.

Everyone who has been to Cornwall has felt this strange magic that haunts its wild and most beautiful scenery and vibrates in its bracing air. But what is it? Can it be merely the surviving atmosphere of races of poor semi-savages? And what was the reason why its denizens haunted this spot? Were they driven hither by conquerors, or did they remain from choice? There are other such spots on earth—places where there is magic in the air and modern civilization has failed to encroach; where the people still cherish a longing retrospect towards some loved past, forgotten but yet remembered. These spots are sacred places where the vitality of the Earth was focussed and Nature's life-pulses beat more warmly. To these spots resorted those of the ancient races who understood the Divine Magic; and it is the influence of their rites that still haunts the sites, as well as that of the fires of Earth which have died down but not gone out.

The conventional scientific theories of human derivation will not do: they are little better than the earlier theological dogmas that derived us all from Shem, Ham, and Japhet. It simply is not true that the human races get more barbarous as we trace them back, and

that the various "ages" succeeded one another in regular order. These ages are geographical rather than chronological; they are interstratified with one another all over the globe. Civilizations both precede and succeed barbarian eras. Wherever a wandering tribe has settled down and used stone implements, there is a stone age. And many of the imagined stone ages may be nothing more than the ultimate filtrate deposited by time from the remains of many communities; just as our own civilization might vanish, and all its iron and paper decay, leaving nothing but a few stone implements at the bottom.

Again, the so-called aboriginal races are not like growing children, but like old men reviewing their past. They do not (as races) progress; they either stagnate or diminish. Their regard is all towards a remote past whence they derive their traditions and customs; traditions and customs curiously similar all over the globe.

All these peoples, as also those who have left their strange buildings and undying influence in Britain and Europe, were descendants of the great races of the far prehistoric past; races mighty in knowledge and prowess, whose glory is recounted in the early annals of all nations. All over the north of Europe there was a great civilization; it was an offshoot of the Atlanto-Aryans.

But cycles move, and the future brings the past back again. Again the breath of the past is with us, and we begin to recognize the existence of a greater knowledge than that which we have called knowledge. These magic influences that poets feel are no idle dreams, but realities, echoes of the Divine Magic of the past, and heralds of its coming again in the future.

The Pan-American Bureau

THE International Bureau of the American Republics (or Pan-American Bureau) was founded in 1890, in accordance with resolutions passed at the First International Conference of American Republics, held in Washington, 1889-90, and presided over by James G. Blaine. It was continued by resolutions of the Second Conference, Mexico, 1901, and the Third Conference, Rio de Janeiro, 1906.

Its objects are to develop commerce and to promote better relations and closer intimacy among the republics. For these purposes it is in touch with manufacturers and leading men on both continents, publishes numerous books and maps, and issues monthly bulletins of information. Its legitimate correspondence with all parts of the Western hemisphere now exceeds 3000 letters per month; an increase of nearly 400 per cent in two years, attributed to the efforts of Elihu Root. It is supported by annual contributions from the republics, and its governing board consists of their diplomatic representatives in Washington, presided over by the Secretary of State of the United States as Chairman *ex officio*.

Director Barret said in an address to the Trans-Mississippi Commercial Congress, San Francisco, 1908, that it was his confident belief that in the next ten years Latin America would emerge and engage the attention of the world as Japan and the Orient have recently done. He continued:

Were it not for the lamentable ignorance which prevails throughout the United States in regard to the peoples, institutions, resources, and governments of this section of America, this statement would not seem in the least surprising. Those of us who have traveled from Cuba to Chile and from Brazil to Bolivia are keenly aware that this great onward movement has already begun and that Latin America has entered upon a new era of splendid activity and world-wide influence.

Twenty republics varying in size from the area of Brazil, which is larger than that of the United States proper, to Salvador, the smallest, which would take in Rhode Island six times over, having a combined population of nearly seventy millions, and a foreign commerce valued at more than two billions of dollars per annum, are going ahead so rapidly that no man can safely prophesy the limit of what they will accomplish during the next ten years. Gifted with a variety of climates and of resources, blessed with a marvelous intermingling of cool plateaus and tropical lowlands, provided with vast navigable river systems, and a long extent of accessible coast line, supplying numerous important products which the rest of the world must purchase, and possessing a people of deep sympathies and high intellectuality based on an old and worthy civilization, they all challenge our best study and keenest appreciation.

According to approximate figures the United States has 85,000,000 population, and the Latin American Republics 70,000,000; of this latter figure Brazil has nearly 20,000,000, Mexico nearly 14,000,000, and Argentina nearly 6,000,000.

As to area, the Latin American Republics lead with 9,000,000 square miles; while the United States (without Alaska, etc.) has only 3,000,000. Thus Latin America comprises three-fourths of the whole; Brazil being larger than the United States proper.

This year an exposition will be held at Quito, Ecuador. A Pan-American Scientific Congress has been held in Santiago, Chile, and adjourned to meet in Washington during 1912. The first Central American Conference met at the capital of Honduras on Jan. 1st. A touring company is conducting a four months' tour of all South America with some European countries thrown in.

The above are some particulars derived from the literature which the Bureau circulates. As is to be expected, it is commerce that forms the principal topic, this seeming at present to be the most practical purpose which nations are able to set their thoughts upon in their efforts at union. The other object, to promote intimacy and friendship, is regarded as subsidiary; as may well be the case, since these qualities are rather means than ends. But it is permitted to the CENTURY PATH to look farther and suggest the inquiry whether intimacy and friendship may not have some other outcome than commercial advantage; especially in view of the opinion, which Theosophists hold, that commerce is not of itself sufficient to secure the welfare of mankind. The view of the civilized world which one is obliged to take after consulting the current sources of information makes one doubtful whether commerce is in such a healthy condition that its extension would be an unmixed blessing. Naturally, therefore, Theosophists must look with solicitude towards the prospects of something more than mere extension of commerce coming out of this approach of the nations.

One thing is certainly the broadening of our ideas; for it seems that even the free-born inhabitants of this vast country of ours can be insular and sometimes forget that the

word America is not synonymous in all minds with the United States. Here is a race of Americans, one of whose countries alone is larger than all the United States put together; and population is merely a question of time. The rate at which this race is developing is unsurpassed. It is actual values that count, not estimated values; and time alone can be the judge.

The Latin Americans have many valuable qualities with which our northern race is less amply endowed. It may be that they are as much needed in the future evolution of humanity as we are, and that their qualities will supplement ours, correcting our deficiencies. It may be, too, that they can learn many lessons from us.

A Theosophist naturally looks to the evolution of mankind into something better than its present commercial state. He looks for the evolution of true Individualism. Individualism at present is rather a boast than a fact; a better name for the kind we have would be "personalism." But there seems to be a fair consensus of opinion among leading writers that what the world most needs is the emergence of the true Individual. The formation of individual Character is our most valuable future asset. Theosophists are looking for man to become conscious of the existence of his Spiritual Will—his real Self; and they believe that in proportion as he does so awaken, a wider knowledge and greater opportunities will open out before him.

Supposing the congresses of nations were to devote some of their time to discussing the best means of overcoming social evils of various sorts, the best methods of educating the young in habits of self-discipline, the essential truth underlying religions, and other topics that concern the real welfare and happiness of every human being. To some extent there is a tendency in this direction; but humanity lacks *knowledge*. For it must be confessed that however exact and practical may be our science and organization of affairs in certain respects, in certain other and very vital respects it is lacking and we are adrift in a sea of doubts and conjectures. In fact, our civilization might well be described as aimless, drifting towards the unknown, impelled in certain directions by powerful forces rooted in human nature, ignorant of whither these forces will carry it. The great Science of sciences is needed, the Science of Life: knowledge concerning our own nature, its laws, and how to use it. As this knowledge becomes diffused, humanity will acquire worthier objects than that of merely satisfying the personality and promoting the growth of material industrialism.

E.

The Crocodile-Bird

IT appears that there are some who throw doubts on the credibility of Herodotus' story of the bird that feeds in the open mouths of crocodiles. But the crocodile of Santo Domingo is said to have the same thing done to it by a small bird; and a traveler in Africa writes to a contemporary to say that on the Zambesi he has seen a small sandy-colored bird in close attendance on crocodiles. The captain of a river-boat told him that the natives said these bird's cleaned the crocodile's mouths and warned them when asleep of approaching danger.

Art Music Literature and the Drama

Beauty and Morality

"PROCEEDING from absolute mind, whose nature is goodness as much as truth, the great works are always attuned to moral nature," says Emerson, giving expression to a Theosophical thought; for Theosophy teaches the necessity for the strictest morality as a basis for any lasting structure. "The good, the beautiful, and the true,"—this is the trinity upon which the Theosophical structure rests, and all the parts thereof must partake of the nature of their foundation and source. Thus *true* art must be moral in aim, else it be not art but a travesty, a reversal of the true, and born of *mâyâ*—of ignorance.

In a wise old book left us as an heirloom from an age when things spiritual were better understood and appreciated than in later times, we find this statement: "Ignorance is the notion that the non-eternal, the impure, the evil, and that which is not soul, are, severally, eternal, pure, good, and soul"; and *Ignorance* (teaches Theosophy) is the cause of all human misery.

Perhaps one unacquainted with Theosophy would hardly think that the question of beauty and morality being inseparable had any vital bearing on life. But considered Theosophically it comes home strongly to us. Is it not natural to turn towards beauty, and to love and admire it? To dwell in heart and mind on what is considered beautiful is the natural bent of humanity, pleasure and interest are aroused by the attention we pay in that direction—and then follows the aftermath. If we have taken the impure and the evil, that which has only a surface beauty, the false coin for the true, we reap a harvest of pain, for it is very, very true that all is not gold that glitters. Tinsel and pinchbeck in half-lights look very well—but when it comes to use, the true character is seen. Ignorance is half light at best, and the fact that soulless pictures, expressing sordid ideals, jingling music and maudlin songs, pass current as art (!) and true sentiment, is surely not a high compliment to our powers of soul discretion. Is it not time that Theosophy came to us as guardian and guide on our pilgrimage towards perfection, as the torch of Truth whereby we may relight the waning fires of belief in "the

good, the beautiful, and the true" as being inseparable, and so regenerate our lives? Think what enormous educational factors art, drama and music might become—*will* become indeed, for the raising of the tone of human consciousness. Already at Point Loma a purified art and drama, and the tones of the master musicians—those who strove to serve mankind—

and those of high moral feeling are the ones who express the greatest truths—be the medium of expression art, music, literature, or drama. They alone express the spiritual nature, the *immortal*, through their work. They alone have the power to bestow upon their works the heart touch, the saving grace of truth, the higher purity. E. I. W.

Art, Religion and Money-Getting

A FRIEND from over the water writes that friction of a somewhat threatening nature is developing over the question of the next Passion Play at Oberammergau. It is not to be produced until 1910, but a certain proportion of those interested now complain that the religious significance of the festival is being destroyed, and some even go so far as to advise that the play shall be peremptorily brought back to its one time simplicity and sacredness, or be abolished. For some time it has been evident that merchants, innkeepers and railroad interests were slowly destroying the spirit of the festival by their money-making schemes, but now it is charged that relatives of the actors and actresses have traded upon the popularity of their names to obtain political preferment! The final straw, it is said, was the effort of a young relative of the famous impersonator of Christ in the play to have himself made village postmaster on account of what he termed the "high religious office" of his distinguished relative. The clerical party, angered and shocked, forthwith entered politics and defeated the young politician, and then entered upon a crusade of protest which they say has effectually frightened the simple peasants into submission. The latter, ever since the time of the plague in 1633, have in simple gratitude and faith performed this play each decade, and wish to continue to do so. The clergy desire to

limit attendance upon it to those who are religiously inclined. But how shall they determine this? Will they limit the attendance to those who can furnish a letter of recommendation from their home pastor? If so, some very worthy people might be left out, not to mention certain monetary profits. Perhaps they will require the signature of would-be patrons to some "confession of faith"—in case they can agree upon one. In any event we may expect another definition of "religion." H. H.

CAMPOLICAN, AN ARAUCANIAN CHIEF
AND NATIVE CHILIAN HERO, VALPARAISO

are making their influence felt. It is a glad day that is ahead of us when the necessity of morality as a basis for true beauty is felt universally in the human heart. It is unselfishness that unlocks the door to the realms of discrimination where realities are sensed instead of shadows; it is Brotherhood in its deeper sense that is the true enlightener. Art, drama, music and literature are the outward expressions of the evolutionary status of a people; the pure at heart are the perceivers of beauty,

"As a Man Thinketh, So Is He"

IT cannot be too often reiterated, nor by too many analogies illustrated, nor in too many fashions expressed, that the thought-world is the *real* world. For the habit of living on the surface, of concentrating attention on externals and effects, has become so confirmed that nothing but the fullest realization of the futility of this method and the most heroic persistence in overcoming it, will ever make it possible to break the old chains and teach men how to form their own characters, instead of simply allowing them to be formed by circumstance and wants.

In the thought-world — the formative world — are planned the patterns which the whole world then proceeds to weave. "And as man is a thinker, as it is that indeed which makes him man, the position he occupies in the world of thought shows his real status, not the way he looks, nor what he does, nor how he talks."

The above quotation taken from a Book of Wisdom, does not say what a man believes nor yet what a man thinks, so is he, but *as a man thinks*. There is a certain quality in thought, quite separate from the subject matter, which classifies it. And it is quite certain that whatever divisions and subdivisions, planes and sub-planes, there may be stretching all the way from our simple perceptions to infinity, there are two broad classifications which separate into distinct ranks the vast army of souls. They correspond to the right and left hand paths, and are as evident to the inner gaze of those trained to see in the thought-world, as are light and darkness to the physical eye. Back of what one says, back of what he acts, back even of a superficial line of thought, there is a certain something which perhaps we can best translate by the word *purpose*. This places him; and as soon as we begin to think of real things, tells us what he is.

All this may be hidden from a man's associates for years, for a lifetime perhaps, if no crisis arises to startle from him his secret, no

fierce and sudden wind to blow off the cloak which covers him. And not only from his associates, but from himself even, he may succeed in hiding himself. But a time comes, sooner or later, when all must stand for what they *are*. And the Soul of each will be satisfied with nothing less than the best.

STUDENT

THE ever unknowable and incognizable *Kârana* alone, the *Causeless Cause* of all causes, should have its shrine and altar on the holy and ever untrodden ground of our heart — invisible, intangible, unmentioned, save through the "still, small voice" of our spiritual consciousness. Those who worship before it, ought to do so in the silence and the sanctified solitude of their Souls; making their Spirit the sole mediator between them and the *Universal Spirit*, their good actions the only priests, and their sinful intentions the only visible and objective sacrificial victims to the *Presence*.

H. P. Blavatsky — *The Secret Doctrine*, p. 280, vol. I

The Crown of Many Failures

TO all who live to any earnest purpose there must come at times an aching sense of such discouragement as almost to amount to sheer despair. The life we have imagined in our brighter visions when compared with the dim twilight of our common day, seems to be so impossible, so dazzling and remote. But for our comfort we should bear in mind that the disparity which lies between achievement and ideal is in exact proportion to the magnificence of our imagining. Those who continue to exist in placid, bovine satisfaction with the task of trying to allay the endlessly recurring animal desires, can never know the heartache of repeated failure to express divinity in daily life. And yet the fact that we are making the attempt is in itself the certain warrant of our ultimate success. To cherish an ideal is to enjoy a foresight of a glorious dawning that will break upon our darkness at no very distant day.

The soul in many cases finds it easy to arouse the mind to the reception of entrancing visions of a perfect human life where harmony pervades the whole like music; duties are done from willing, eager choice, and a warm glow of brotherhood diffuses through the working day. But when we come to mold our conduct on the pattern of our dream, how rigid and unyielding are the habits that constrain our lives! Yet every effort, even though it fails in its immediate aim, goes to increase our cumulative store of power. We have at least succeeded in awaking *will*, if only for a moment's space, and like the tiny sparks stored in a Leyden jar, one day it must blaze out upon the midnight of our mental gloom in a transcendent flash of light. STUDENT

The Trend of Woman's Work

THE last exhibition held by the National Society of Craftsmen in America, at which both women and men were exhibitors, brought to light interesting evidence that the trend of woman's hand-work was changing its direction. Examples of needle-work, knitting, lace-making, and the smaller textile-work generally, were very few in number compared with work made by trade tools. Over one hundred women exhibited jewelry, much of it of a richness and artistic value suggestive of the art-work of the medieval guilds. Wood-carving formed an important department, book-binding another, and the work in heavy metal, involving severe toil with hammer and before a forge, was remarkable. Not only were silver and copper smaller pieces shown, but immense frames, candelabra, swinging signs, corner supports for buildings, fenders, andirons, etc., all designed and hammered out by women's hands. In the pottery department a very large number of the exhibitors were women, their work being especially notable for originality of treatment and design, surely a great step beyond the painting of a few timid butterflies or a lonely spray of forget-me-nots on a cup and saucer, which was

as far as women ventured into the realm of ceramics up to a few years ago.

There were, in the larger decorative forms, textiles in plenty, dyeing, stencilling, decorating of all kinds, and loom work of many special designs. But the poor little embroidery needle, knitting-needle, crochet-hook and tatting-shuttle of our mothers and grandmothers are evidently retreating to their proper sphere, which is rather more that of use than of beauty. If the day of crocheted "tidies," embroidered "doilies," interminable "mats" and "throws" has slipped into the background, let us be thankful. Such broad art-

Jottings and Doings

(From a Student's Note-Book)

CONSIDERABLE interest has been aroused by the seventeenth volume of "London Statistics" which was issued last year by the London County Council. Every phase of the life of London is set forth in clearly drawn maps, plans, and tables. According to these, the average age for marriage is from twenty-one to twenty-five, there being very few marriages of boys and girls under twenty. In all London four who had remained bachelors for seventy years finally married, while of spinsters seventeen could

personally interviewed hundreds, and by simple reasoning (which must have its bearing upon the pocket, of course, in these days, as well as upon the finer sentiments) has secured the co-operation of practically all.

Whatever one may think of the idea in general, the plan carried out by this woman bids fair to be as efficacious as it is novel, for teamsters who have thus asked to have the ordinance passed will naturally take a certain pride in obeying it, once the petition is granted. A wholly different sentiment will be aroused than would be the case had they been neither considered nor consulted beforehand.

Lomaland Photo. and Engraving Dept.

ROTTEN ROW, HYDE PARK, LONDON

craft work as women are now doing more largely every year not only means more beauty in American homes but more bigness, more dignity, more real beauty in all lines of woman's special work. For woman's work is distinctive, it is not man's and can never be. It is of the heart and center of the institution which is the rock of all states and nations—the home. And whatever brings largeness, artistic perception, and emancipation on lines of hand-work to woman fits her the better to found home-life on a basis of true ideals.

Unlike the efforts of women to make a place for themselves in the business world, art-craftsmanship seems likely to forward the higher interests of the nation's home life, not delay their march. While it has a commercial aspect, necessarily, for many craftswomen must find in their designs a means of livelihood, yet in the work shown at the recent exhibition that is obviously secondary. There was no evidence of slipshod or slackly inartistic effort, such as always betrays work made "for the market," but every sign of loving care, creative thought and skill. STUDENT

not make up their minds as to the important step until they had passed the sixtieth milestone. The following table summarizes other statistics of interest:

Population (Administrative County, 1907)	4,758,217
Population (Greater London, 1907)	7,217,939
Ratable Value (1907)	£43,868,543
Metropolitan police	17,000
County Court actions heard (1907)	62,178
Passengers conveyed by local railways	304,077,495
Passengers conveyed by tramways	478,864,877
Passengers conveyed by two principal omnibus companies	291,563,048
Letters delivered (year 1905-6)	753,400,000

A NOVEL plan is being carried out by a prominent leader of society in a western metropolis in behalf of the over-worked and over-loaded horses of the city. She has prepared a document embodying an ordinance regulating the tonnage that a horse may properly be required to draw, this to be submitted later to the City Council. Instead, however, of securing as sponsors for it her society friends and whomever else might be easily available, she has gone among owners of horses and the teamsters themselves, has

This woman must know a bit about human nature—and is it not a sign of better days to be that so many who might spend their whole time in selfish enjoyment, if they chose to do so, choose the "better part," the task of helping to set wrong things to rights, of making life a little less hard and hopeless for those who cannot speak for themselves?

GREAT men and great causes have always some helper of whom the outside world knows but little. Sometimes these helpers have been men, sometimes they have been women, who have given themselves to help and strengthen those called upon to be leaders and workers, inspiring them with courage, keeping faith in their own idea alive in days of darkness. Of their noble company of unknown helpers Caroline Herschel was one.

So writes Mrs. John Herschel of the gifted and beloved sister of her husband, that noble woman who willingly gave up the wide fame she might have won as an astronomer to assist her brother, self-effacingly, in his important work. As the tribute of a wife to one who shared her husband's life in a peculiarly tender and intimate way, the above is especially beautiful, impersonal, and just.

OUR YOUNG FOLK

Philippa of Hainault

THE history of the middle ages is so full of queens who were cruel and unscrupulous, or weak and pleasure-loving, that when we find one who was courageous and strong and merciful, we should learn her history and treasure her name and her memory.

Such a one was Philippa of Hainault, queen of England, and to this day none has gainsaid the words of Sir John Froissart concerning her. He himself was a Hainaulter and held a position in Queen Philippa's household. He says:

Tall and upright was she, wise, gay, humble, pious, liberal, and courteous, decked and adorned in her time with all noble virtues, beloved of God and of mankind; and so long as she lived the Kingdom of England had favor, prosperity, honor, and every sort of good fortune.

When she was fifteen she was married to Edward III of England, and their oldest child was the famous Black Prince, afterwards so celebrated at Crécy and Poitiers, whose valor and ability were seen not only in his strong, resourceful father but in his brave and fearless mother.

She herself assembled a body of twelve thousand men and led them against an army of fifty thousand Scots who were invading England during Edward's absence on a campaign in France. She exhorted the soldiers to do their duty and would not leave the field until the battle was begun. The Scots received a defeat such as they had never yet known, and their king, though fighting valiantly, was taken prisoner.

'Tis not here we would discuss the rights of English, French, and Scottish monarchs, but we journey happily with Queen Philippa to meet her lord in France, where she was received in the English camp before Calais with the triumph that was her due. This was the age of chivalry and gallantry, and if Edward's court excelled in them, it had its inspiration. And now we come to that episode of Queen Philippa's life by which she is best known and for which we love her most. It is Froissart who has told it to us.

As we have said, King Edward was besieging the town of Calais, and when all hope was gone the worthy captain began to treat with Edward for terms of surrender as merciful as might be. But the king's heart was hardened and angered against the people of Calais, and all that he could be persuaded to grant was that six of the chief burgesses of the place should bear the punishment for the others; that they should come to him bareheaded and barefooted, with halters around their necks and the keys of the town in their hands. When this was told in Calais the people

VIRTUE

THE heart, unalter'd in its mood,
That joys alone in doing good,
And follows in the heavenly road,
And steps where once an angel trod,—
The joys within such heart that burn,
No loss can quench, nor time o'erturn!
The stars may from their orbits bend,
The mountains rock, the heavens rend,
The sun's last ember cool and quiver,
But Virtue still shall glow forever!

James Hogg

MUSIC

OF all the arts beneath the heaven,
That man has found, or God has given,
None draws the soul so sweet away
As Music's melting mystic lay;
Slight emblem of the bliss above,
It soothes the spirit all to love.

James Hogg

wept and there was great sorrow. Then the first burgess, Eustace de St. Pierre, rose and offered to be one of the six to save the people. Five others followed him and they went to Edward as he had said. When they knelt before the king, earls and barons and all who were there entreated the king to have mercy on them, but he would not. Whereupon the queen, weeping and kneeling before him, so besought him for their lives that he could not deny her, and gave them to her to do her pleasure with them. And she had them brought to her chamber and the halters taken from their necks, and clothes and food were given them, and each man departed with his liberty and six nobles in money. E. H. B.

Joy Expressed in Music

HAYDN was once questioned by his friend Carpani, the poet: "How does it happen that your church music is almost always of an animated, cheerful, and even gay description?"

"I cannot make it otherwise," replied Haydn, "I write according to the thoughts which I have. When I think upon God my heart is so full of joy that the notes dance and leap, as it were, from my pen; and since God has given me a cheerful heart, it will be easily forgiven me that I serve him with a cheerful spirit."

How characteristic are these words of the immortal Haydn! Although he had to endure many hardships and pass through trials which would have soured many a less unselfish nature, yet he always retained the natural sweetness of his disposition and was remarkably jolly and full of fun.

His works show the power which music has to make us feel the joy and sunshine of life; for the beauty and charm of their spontaneous gaiety, brightness, and purity are irresistible. MUSIC STUDENT

The Prettiest in the World

EVEN if one takes the greatest pride in what one has, it is as well not to publish the fact; at least a poor foolish Snipe once found this to be so. Meeting a Hunter on his way to the wood, she begged him not to shoot her children. He was very good-natured and said he would not hurt her little ones if he only could know them from the other birds.

"Well," said the Snipe, "that will be very easy: they are the prettiest birds in the wood."

The Hunter said he would be sure not to hurt them and told the Snipe to go on her way without any fear. But what was her horror, an hour later, to meet him carrying the young snipe! When she reproached him for breaking his promise he said, "Why, I looked around for the ugliest birds, so as not to shoot your little ones!" This was no comfort to the proud mother. INGEBOG

THANK God every morning when you get up that you have something to do that day which must be done whether you like it or not. Being forced to work, and forced to do your best, will breed in you temperance, self-control, diligence, strength of will, content, and a hundred virtues which the idle never know.—Charles Kingsley

RECTITUDE is perpetual victory.

THE CHILDREN'S HOUR

WHEN BABY CAME

The sheep said, "Take my wool
To make the baby's wrap,"
The silkworms spun the floss
To weave a silken cap,
And birdies brought their
feathers white
To fill a pillow soft and light
When baby came.

The trees made gifts of wood
To build a cradle nest
In which the baby boy
Could cuddle down to rest,
And flowers vied with one
another
In making nosegays for his
mother
When baby came.

Everybody's

Marco Polo

NEARLY two and a half centuries before America was discovered there lived in Venice a boy named Marco Polo. His father and uncle were rich merchants and great travelers, having penetrated farther into Asia than any other Europeans. When they returned to Venice they had so many tales to tell of strange sights and marvelous adventures in the far off country of Cathay, as China was then called, that Marco listened with breathless interest and longed for the time when he would be old enough to travel with them.

Travel in the thirteenth century was quite different from travel today; it had not been made so easy and delightful as it is now. The world had never heard of steamships and railroads, and seamen were afraid to venture out of the known waters because the world was believed to be flat and no one knew what lay beyond the far horizon. Travel was full of hardships and perils on land and sea. For instance, instead of crossing a desert in a Pullman palace car in the modern American fashion, think of having to cross one seated on the back of a humpy camel along with one's baggage and provisions, under the blistering tropical sun, facing blinding sand-storms and encountering bands of robbers!

When Marco was twenty, his father and uncle started again for Cathay and took him with them. It took them just four years to reach the royal city of Cambalu (now called Peking) for galley ships, camels, and elephants, make slow progress at best. Cambalu was the capital of the great Mongol Empire, and here the magnificent emperor Kublai Khan had his palace and court.

Kublai Khan received them with all honor and gave a great feast of welcome to the

travelers; the palace was crowded with guests to meet them. The elder Polos had learned the Mongol language during their previous visit and so could talk with the Khan. They told him of all the affairs of Europe and about their journey and he listened with great interest.

Marco had never seen such splendor, wealth, and luxury as was displayed at the court of Kublai Khan. The throne was of gold and set with precious gems, and everything about the palace was in keeping with this magnificence. The Khan was particularly pleased with young Marco and offered him an important position in his household. Marco began to study the language, the laws, the customs, and religion of the country, and soon gained the Khan's entire confidence, being sent on affairs of importance all over the country.

The Polos taught Kublai Khan the European mode of warfare and how to make and use catapults in besieging walled towns, and

were of such service to him that he heaped honors and riches upon them. Marco became the Khan's especial favorite and was made a noble of the empire.

The Polos spent seventeen years at Cambalu but at last became homesick for the sunny Italian skies and their old Venetian home. But the Khan refused to part with them and they began to wonder how they ever would get away. Finally Kublai Khan's granddaughter was to marry the King of Persia, so the Polos, seizing the opportunity, guaranteed to conduct her in safety to Ormuz where the royal bride-groom awaited her. The Khan agreed to this, but exacted from them a promise to return to him after a short visit home. As a parting gift, he gave the Polos a casket of rubies, and the bridal party started on their long journey. In a year and a half they arrived at Ormuz in Persia to find that in the meanwhile both the Persian King and Kublai Khan had died. This released them from their promise to return to Cathay, so after spending some months in Persia they turned their faces towards home.

At last they arrived safely in Venice after an absence of twenty-four years. They were so changed in appearance that no one knew them and at first people would not believe that they were the Polos.

In a war between Venice and Genoa, Marco was taken prisoner, and during his imprisonment he wrote an account of his travels and his life at the court of the great Mongol Emperor Kublai Khan. L.

Twentieth Century Children

HOW fortunate are the little ones who are living in the countries where Râja Yoga is being taught! Râja Yoga is like a big shining signal to them. And when they see the signal they know, even the very little children, that it means a wonderful, new happy, helpful, life for humanity. They show that they understand the great opportunity Râja Yoga is offering to the children of the world, because just as soon as they begin to be Râja Yoga pupils they *try, try, try*, in a way which shows that they are finding the warrior spirit. This is what the Râja Yoga signal is for—to arouse all the little warriors and band them together in an army of compassion. GENTIAN

NEW POINT LOMA EDITION, WITH A PREFACE

by H. T. Edge, B.A. (*Cantab.*) an old student under H. P. Blavatsky and now a member of the Staff of Professors at Point Loma, California.

Vol. I treats of Ancient and Modern Science
Vol. II treats of Ancient and Modern Religion

The reprint of this invaluable work is in answer to a constant demand, which shows that the book is *alive* and is needed by the liberated spirit of the age.

THE MYSTERIES OF THE HEART DOCTRINE

Prepared by
KATHERINE TINGLEY
AND HER PUPILS

*The Theosophical
book of the
Twentieth century*

Tells the story and the history of the
Theosophical Movement.

The prices are \$2 in cloth and \$1.00 in
paper, which barely cover the cost, for it is
printed and bound, not gaudily, but with
such carefulness and thoroughness of art
and craft as to make it unique among
modern edition books.

Order now from

**SOME OF THE ERRORS OF CHRISTIAN
SCIENCE
CRITICISM**

by **H. P. Blavatsky and William Q. Judge**

CONTENTS:

"The Empty Vessel Makes the Greatest Sound"
A Note of Warning

— by **H. P. Blavatsky**

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

— by **William Q. Judge**

A MOST VALUABLE PAMPHLET. Outside of Theosophy
there is given no adequate explanation of the healing
that is at times accomplished, nor of its *rationale*,
nor of the ultimate price that must be paid and the
dangers connected with such practices.

This pamphlet is invaluable to all students.

The Story of the Dog and the Cradle

STUDENTS of Theosophy have good reason to believe that the majority of the quaint legends which the folklorists have collected are not pure fiction. H. P. Blavatsky showed us that popular traditions were frequently more reliable than so-called history. Mankind has a tenacious though imperfect memory, and the agreement of many national folk-stories in essentials is evidence that they embody the main features of actual events which have impressed the imagination sufficiently to have been preserved. Gratitude is due to H. P. Blavatsky for the original clues she has given us to the meaning of the obscure records of the past, such as *Genesis*, the Norse legends, the Indian Purânas, the Egyptian *Book of the Dead*, and of the almost universal traditions of giants and of lost continents. The Theosophical key opens all these locked doors and proves that mankind has had a far more wonderful past than materialistic knowledge dares to admit.

Cold water is generally thrown by scientific writers upon the suggestion that primitive traditions have any basis in fact, by showing that the same kind — or even the very same — stories are to be found in races widely separated in space and time. It is the popular scientific belief that similar inventions crop up spontaneously when culture has reached a certain stage, without the necessity of transmission. Thus we see such "childish" things as the Creation myth, the Atlantean and other Deluge myths, explained away with a superior smile.

This hypothesis may have a small measure of truth in it, but it is absolutely misleading when it deals with the larger outlines of terrestrial evolution. It becomes an obstacle on the track of discovery, preventing the real import of the antique traditions being looked for. It depends upon the false assumption that materialistic science, with its refusal to investigate the evolution of the *soul*, is familiar with the course of man's past development in general outline, and that the savage of today illustrates the condition of all mankind a few thousand years ago.

A Saner View of Human Progress

Fortunately for truth's sake, a modification of this position is taking place, and some investigators are beginning to think that there may be something in the curious and poetical legends of antiquity. The proofs which Egyptology has brought us that Herodotus was not the "Father of Lies," and the discoveries of Pompeii and Troy, long

supposed to be mythical, have broken the crust of skepticism to some degree. We even find leaders of thought like Sir William Ramsay, the archaeologist, declaring that he believes the savages of today do not represent the state of early mankind, but are on the down grade, as they show no evidence of rising, unless assisted by higher races. This intuitive thinker comes very near to the Theosophical teaching, which is that the lower races are degenerate descendants of once great peoples, while the real "primitive man" was a very different kind of being whose remains have not yet been discovered.

The story of William Tell and the Apple, or that of the Dog and the Cradle, are referred to frequently by folklorists as good illustrations of baseless yet widespread legends coming forth at certain stages of culture in different races. The Dog story is as follows. A certain farmer was plowing and left his dog to guard the baby. When he returned after a short absence he found the dog wildly excited, his mouth bloody, and the cradle upset. No baby was to be seen. Too hastily the farmer concluded that the dog had eaten the child, and he instantly killed him. But he soon finds the baby unhurt lying underneath the cradle asleep, beside a dead serpent, which the faithful hound had killed. He can do nothing for the dog, of course, but his remorse is great. The origin of this tale is Hindû and may be found in the well-known collection of stories called *Hitopadesa*. There, an ichneumon replaces the hound.

Why should not the incident have actually taken place? Why should the wise men of science wish to relegate everything possible to the domain of fiction? It would almost seem as if there were a conspiracy to minimize the credit of ancient records and to depict man of a few thousand years ago as a very absurd creature, almost imbecile. The atmosphere of pitying contempt thrown around our ancestry tends, of course, to magnify the intelligence of today by contrast, and it has been suggested that the underlying motive in this policy is the desire to excuse the present age for its selfishness and brutality; for if man has been civilized for very long periods we ought to be ashamed not to have done better. But to return to our Dog story.

A strong argument that the incident was not a product of imagination has just been afforded by an animal tragedy of a precisely similar character, enacted near Richmond, Va. last May. A child of four fell into a creek

and would have been drowned but for his setter dog which dragged him ashore. Leaving him more dead than alive the dog ran home for assistance. The child's mother, seeing the excited condition of the dog and the foam on his lips, thought him mad, and called her

husband, who struck him a violent blow on the head. They soon found that they had made a mistake, and the dog had just strength enough to lead the father to the half-drowned child before he fell dead. The grief of the family was naturally great, and they gave the dog a handsome funeral.

Now this dog story is really more improbable than the ancient one which is classed with fiction, and yet it happens to be true!

There is a weird legend of Lough Neagh in the north of Ireland which has always been considered a mere fancy, but lately some confirmatory evidence has been forthcoming. Thomas Moore speaks of it in these words:

On Lough Neagh's bank, as the fisherman strays,
At the cold, clear eve's declining,
He sees the round towers of other days,
In the wave beneath him shining.

It has lately been shown, on geological grounds, that in former times the lake was much smaller, and that a large part of its bed was dry land. In Switzerland there are similar traditions of sunken castles in Lakes Léman and Paladen, which have been treated

as purely mythical; but they were founded on fact, it seems, for submerged remains of "pile-dwellings," showing reasonably high culture, have been found at the exact spots mentioned as the sites of the "castles."

The present skeptical attitude concerning the ancient legends is largely due to the unreasonable demands of priests of almost every religion that the allegories of their scriptures should be taken literally. The Bible itself, especially the Old Testament, contains a great mass of hidden meaning which cannot be interpreted without the aid of Theosophy. The task of the scholars of the next generations will be to unravel the allegories of all religions for the enlightenment of the thinking portion of mankind, which is rapidly giving up the dogmas; and to do this they will be compelled to use the keys given by H. P. Blavatsky, for there are no others. So students

of Theosophy who sometimes wonder how much longer it will be before the world awakens to the light, may very well have patience, for the truth will make its way

just as fast as the people are prepared for it. The trend towards independence of thought is becoming very marked, and many persons are moving toward that place where they can receive the help they are seeking. STUDENT

Is There a Planet Beyond Neptune?

WHILE the planet Neptune, which revolves at the enormous distance of 2800 millions of miles from the sun, is the outermost known planet, strong suspicions have been aroused recently that there are yet further members of the solar family, the next being probably about 100 times the earth's distance from the sun, and taking

about a thousand years to complete its orbital journey. There is nothing inherently improbable in the suggestion, and there is at least one good reason in its favor, sufficiently strong to have set many astronomers searching for such a planet.

It seems that the attractive forces of the four greater planets, Jupiter, Saturn, Uranus and Neptune, have so modified the paths of various comets which have strayed into our system that they have been compelled to turn back in their journey towards the infinities and to become permanent members of it, revolving in long ellipses around the sun. Each of the greater planets has a small family of associated comets whose greatest distances from the sun (aphelia) lie near the orbit of such planet. For instance, Halley's comet, to whose appearance in the autumn we are all looking with interest, finds itself irresistibly forced to turn around soon after passing the orbit of Neptune, and there are four others which do the same. Now, from the existence of another group of cometary orbits whose outer ends are at about an equal distance from the sun but far beyond the orbit of Neptune, it is believed that another planet, probably far greater than Jupiter in size, will be found, the controller of that family of comets. Further still there is an aphelion distance of yet another cometary group, pointing to the existence of a still more distant planet.

Professor Forbes of Glasgow has just published a large amount of evidence in favor of the existence of a planet whose orbit must make an angle of 53° with the ecliptic, thus quite removing it from the general scheme of the solar system. At present it would not be visible from northern latitudes, so a search is being prosecuted at the Cape observatory.

Professor W. H. Pickering of Harvard College Observatory has also been led by similar evidence to believe that an extra-Neptunian planet is almost within our ken. This would not be the one in the southern hemisphere, for his planet ought to be in the constellation Gemini, II, the Twins, which lies on the ecliptic. The two planets are being searched for by the potent means of photography, which registers objects too minute to be seen by the human eye even through the largest telescope.

H. P. Blavatsky significantly remarks in *The Secret Doctrine* that Uranus depends very little upon the sun for its sustenance, and Neptune still less. From the vast distance of the latter our glorious luminary and life-giver would seem little more than a particularly brilliant star, and the amount of heat and vital electricity received by the two outermost planets must be very small. H. P. Blavatsky says that there are many undiscovered planets within the solar system, and it is not an improbable supposition that a fresh septenary of planets may start outwards in order from Uranus, depending upon the sun for very little except gravitational control.

Spectroscopic observations have demonstrated that the visible portions of Uranus and Neptune are much alike, while they both differ greatly from the rest of the planets. An astonishing announcement has just been made by Professor Lowell, who says that he has detected the spectrum of *chlorophyll* in the light reflected from the major planets, and that it is particularly well developed on Ura-

nus and Neptune, on the latter most of all! Chlorophyll is the green coloring matter of plants, and is only found in *living tissue*! Can it be that there is a dense vegetation existing on the far-off worlds, and that they are not clothed in an impenetrable atmosphere of immense depth? If so, it will revolutionize more than one "orthodox" conception of astronomy. C. J. R.

Reforming the Russian Calendar

THE Russian Public Education Department some years ago appointed a committee to consider calendar reform. The Russians use the Julian calendar, which is now 13 days behind the Gregorian. The members of the committee are divided into three sections: one is against alteration, another in favor of the Gregorian calendar, and the third advocating a new system. The new system proposes to begin the year at the spring equinox; to divide it into four quarters, coinciding with the solstices and equinoxes, and having in each the first two months of 30 days and the third month of 31. This makes 364 days; and an extra day called "New Year's Day," would be added. The fraction would be made up by having another extra day every fourth year, called "The Day After New Year"; and this extra day would fall out once in every 128 years.

There is such a thing as regulating the calendar too much; would it be an unmixed advantage to have the days of the week coming on the same dates every year? Our attempts at simplicity are not always conceived with a due regard to the claims of comprehensiveness and variety. Likewise, in this case, the larger cycles, denoting the recurrence of coincidences among the smaller, would be eliminated; and such larger cycles of coincidence played an important part in ancient systems of computation. T.

The Precepts of the Buddha

A COPY of the *Kanjur*, or instructions and precepts of the Buddha, has been secured by Lord Ffrench from Peking and taken to England where it is in private possession, though it is hoped that a purchaser may be found who will present it to one of the national museums. It consists of 103 heavy volumes printed in the Tibetan language, apparently from blocks of wood, on pages of coarse grass-paper, two feet long and six inches wide, with seven lines to a page. Only the monasteries of Tibet have complete editions, but the Dalai Lama brought two with him and Lord Ffrench was able to obtain a set. It is valued at £2,500.

Perhaps some of our Oriental friends could furnish us with still more valuable literary archives if they thought we should be likely to appreciate them. T.

WE are at the end of a cycle — geological and other — and at the beginning of another. Cataclysm is to follow cataclysm. The pent-up forces are bursting out in many quarters; and not only will men be swallowed up or slain by thousands, "new" land appear and "old" subside, volcanic eruptions and tidal waves appal; but secrets of an unsuspected past will be uncovered to the dismay of western theorists. . . Let this stand as a prophecy.—*The Theosophist*, Vol. v., p. 43 (Nov. 1883)

Some Views on XXth Century Problems

Healing and Hypnotism

THE Church seems to be in a good deal of confusion about the "healing power."

It "has the gift of healing," said a speaker at a recent meeting of the (English) Church and Medical Union, "but has allowed it to slumber. It should be the object of this society, in conjunction with the medical profession, to restore the use of that gift." A committee was subsequently appointed by the Bishop of London to consider the matter.

We hope it will make up its mind, and that of the clergy in general, between the alternative doctrines. For on the one hand the gift of healing is regarded as a real power arising in a man as a consequence of his leading a very elevated life and exercisable by him wherever he sees disease; and on the other as no power of his at all. "We do not heal or hypnotize," said one of the new clerical operators; "we merely call the patient's attention to his own power to heal himself."

There is nothing specifically Christian in doing that. Any man, leading any kind of life and having any kind of beliefs, Christian or atheist, so long as one of his beliefs was that men can heal themselves, could call their attention to their supposed power. He is clearly manifesting no "gift." What the clergy mean by a "gift" is a *power*, developed or coming from the leading of a very spiritual Christian life. And as they admit that they have allowed this power to "slumber," it would seem that they must also have allowed the kind of life out of which it springs, to slumber also.

The power to heal, in this sense, is the result of a lofty life, the life in which perfect harmony between spiritual ideals, and conduct, has been achieved. The soul of the man can act through his personality. The kind of life is the habitual sacrifice of personality to the good of the world, and it is only perfect when it is as instinctive as breathing.

This healing is not hypnotism, and the fact that hypnotic methods under a pious alias are coming into Church vogue, merely shows how completely the real healing has been forgotten. And that, in its turn, shows something else.

STUDENT

The Hole in the Forum

A RECENT English novel contains a scene in which a large company of people, in a fashionable drawing room after dinner, discuss present social conditions, especially slumdom. Of the causes of slumdom there are many theories and as many remedies. One woman thinks that the rich should interest themselves in the lives of the poor, and relates how she regularly drives down to the slums every Tuesday morning. There are of course the socialist, the land-nationalist, the temperance reformer, the Malthusian, and all the usual rest. "The problem is strictly medical," finally says a doctor.

When a man has been for a long time accustomed to take at table what he is not entitled to, his liver becomes a slum. His only real remedy is to give up

for a less long time a number of things that he normally would be entitled to. At this very minute slums are being created; those who can are taking out of life all that they can, which is more than they are entitled to. The remedy is for them not to take as much as they can.

It would only be half a remedy, if so much. Back of what is done is what is thought or rather felt. The existence of slums is the outward working of human feeling. And human feeling is dominated usually entirely, almost always disproportionately, by self, selfishness. Until in a sufficient number of people the interest of humanity shines more immediately in the center of their consciousness than their own interest, until *others* replaces *self* from the pedestal, no methods of reform will effect anything real, and the disease will go on getting more menacing. The test of that feeling is the *sacrifice* of self in some way. We do not appreciate the occult differences between works that look exactly alike. The lady might drive down on her Tuesday morning, and spend a thousand dollars, accomplishing perhaps nothing, perhaps evil. But if she had *sacrificed* comfort or pleasure for her drive in love for the fraction of humanity she was going to visit, *that* would have been her contribution, fine, real and *effective*, even if she had been killed on the way to her destination. Sacrifice is the one power that can save our civilization — brotherhood in thought and motive.

Auto-Suggestion in Science

THERE are still some few men of science, especially biological science, whose entire thinking day is spent in administering a hypnotic suggestion to themselves. When they write, they give us the formula under whose spell they have placed themselves. Just as at one pole you get people who murmur "All is God," or "All is Mind; there is no matter": so at this pole you hear the murmur "All is Matter; there is no mind." In the one case responsibility to living matter is forgotten; in the other, the man has shut himself out from all possibility of knowing the living Mind and Heart of the world. As the assertion or self-suggestion bites further and further into consciousness, the world gradually darkens and all living creatures become machines. Says Professor Loeb:

Living creatures are chemical machines which possess the property of growing, nourishing, and reproducing themselves automatically. No machine yet created by man possesses this fundamental property. . . . But nothing forbids the supposition that experimental science may succeed, some day, in producing living machines artificially

It must require a long course of auto-suggestion to close the inner eyes of the mind like that. The sentence, and all such teachings, really constitute a call for the better education of children. No child that had been educated to a full knowledge of the life within itself could possibly come to any such state as the sentence reveals.

Throw the light upon a flower from one side only, and it turns that way; throw it

upon the other, and it turns *that* way. Life is nothing but machine-like reactions to stimuli!

Every living creature faces out upon the forces of the universe and reacts to them. In that process it adds to its conscious life, and as its powers grow it selects where possible, among the incident forces of environment, those the reaction to which will give most life. Its organization and powers grow with the effort to select and adapt itself. That effort is the real cause of variations. Just as when the leaves die the tree remains, so, later, when the tree-form as a whole dies, the monad that dwelt therein passes on to another form, rich with the conscious life it had acquired through its "treeness." And so onward. Not far up the animal scale the principle of self-sacrifice appears, really another example of the same process. For even the bird that gives a worm to its nestling has brightened its own consciousness in the care. So everywhere, life adding to itself, to its conscious being, by myriad confrontations of itself and reactions following. Forms die away, to be rebuilt; the life, and the lives of it, go on accumulating consciousness — which is the inner side of life. Death is partly unreal, for the lower lives that take over the disused form and pick it plane by plane to pieces, gain consciousness by that discharge of their cosmic work. Man reacts to still higher forces, those that call him to aspiration, that constitute inspiration, now adding to his intense life in a new way, but always adding if he selects. There is no limit. We can open ourselves up to the action of new forces every day.

In other words, Life has willed eternally to be more Life, and the will is in and around everything living. It throws itself upon itself as force upon receiver, to this end. Which is only another way of saying that the objective and the subjective are co-ordinated parts of one whole moving towards one ever receding perfection. For the objective is merely a compound of subjectives seen from their exterior, moving upward they also. Man's next stage of life is attained by that kind of reaction which is known to him as sense of responsibility. If he refuses, he has stepped away from himself and begun to disintegrate. The machine-world people have set going a mental process of disintegration.

Sane Pessimism

THE French neurologist, Professor Pierre Janet, has been looking back to the medieval records of epidemics of possession and the like, taking them as proof that nervous disorder was as frequent in the past as now and that pessimists have no case.

But it won't do. They were *epidemics*, which indeed we have also. But *our* symptom is the *steady and continuous* annual progress of insanity, suicide, neural disease, and diseases like diabetes and cancer which have a mental element in their causation. For example the deaths under the general head *paralysis*, per 100,000 from all causes, advanced between 1890 and 1900 from 16,000 to 23,000. Let us face the shadows sometimes.

Totemism

ARTICLES on totems appear on page 5 in nos. 3 and 6 of this volume. In deriding totem poles as objects of superstitious worship, people are apt to forget our own griffins, dragons, and heraldic lions, to say nothing of our religious symbols. Totemism is a system by which races are divided into clans, each clan having some symbol (totem) of an animal, plant, etc., which represents the guardian power of the clan. There are also individual totems. The clan totems have served to perpetuate inviolable bonds of unity between all members of the same totem. The institution had its origin in the Science of the great civilizations of the past, from which the tribal peoples are descended. The original meaning is probably lost for some of these people; yet there are some Indians in America who know more than they will admit — except to those who know how to win their confidence and respect. Our own heraldry, and the inaugural ceremonies which we so strangely (despite our own enlightenment) still perpetuate, likewise date from a forgotten lore.

The Masai Creation Story

GERMAN traveler in East Africa describes the Masai Creation story as follows. In the beginning the earth was a barren desert, in which there lived a dragon. Then God came down from heaven and fought against the dragon and vanquished it. Where God slew the beast there arose a Paradise, luxuriant with the richest vegetation. Then God created by his word sun, moon, stars, plants and animals, and lastly the first human couple. He commanded the couple not to eat of the fruit of a certain tree; but they ate it, the woman being tempted by the serpent, which had three heads and was thereafter condemned to live in holes in the ground. The pair were driven out of Paradise by the Morning Star, who thereafter stood guardian at the gate. After this the human race multiplied and genealogies are recorded, until the first murder was committed, when there came a flood. Tumbainot was bidden to build a wooden chest and betake himself into it with his belongings and animals of every kind. Other things similar to those in our Bible are related, including the giving out of ten commandments from a mountain top.

Some will probably say that the Masai received all this from some missionary in the past; but such an explanation is entirely superfluous, as it fails to account for the many other cases of creation stories and flood stories in which the theory of a missionary is impossible. The tribes of Red Men in North and South America, for instance, could not thus have obtained their sacred allegories. The plain fact is that these stories are universal and, like language and customs, point back to common origins and a common culture. These symbolical narratives are all that the tribes have been able to retain of the original cosmogony of their remote and civilized ancestors. There are many of our own race who have

realized that our Bible stories are of the same pattern as these tribal legends, and who have therefore rejected them in disgust; but we should try to get at the real meaning, which can be done by making a study of ancient symbolism generally. Theosophy interprets these symbols — not in an arbitrary or fanciful way, but in a way that convinces by its evident truth and value.

The Taxi-Cab in Ancient China

IT is almost a relief to turn from the long list of our most cherished modern inventions, "known to the ancient Egyptians," to distant China, since we cannot avoid the avalanche of evidence that the ancients everywhere knew far more than our self-esteem allows us to admit, and in many cases more than our science and religion yet know. It is an old story that the famed discovery of

the mariner's compass was long known in China before the West knew anything of it; gunpowder is usually attributed to Chinese sources centuries before it came West, with not unmixed advantages to the West; it is known that the news is printed daily in a regular newspaper in Tibet — news of the world, and not only local matter; even the despised abacus serves the Chinaman to reckon with more quickly than the average clerk with his arithmetic, as may be seen any day in the banks of the Pacific coast.

And now the taxi-cab proves to be a Chinese invention, used in China fifteen centuries ago, and long since relegated to the land of old-fashioned things. A Cambridge (England) Sinologist, Professor H. A. Giles, quotes the following from the history of the Chin dynasty (A. D. 265-419):

The measure-mile-drum-carriage is drawn by four horses. Its shape is like that of the south-pointing chariot. In the middle of it there is a wooden figure of a man holding a drumstick towards a drum. At the completion of every "li" the man strikes a blow on the drum.

Later descriptions describe the measure-mile-drum-carriage at different times during the next six or seven centuries. This taxi-cab assumed the formidable proportions of a two-story car, carved and painted and adorned in various ways. The upper story held a bell, which in addition to the drum beaten below, rang at every ten li. Its carrying capacity was at one time 30 soldiers.

Even as late as the fourteenth century a well-known poet is so struck with this road car that he writes an *Ode to a Taxicab* in praise of the measure-mile-drum-carriage.

In the extract above quoted it is interesting to note the reference to the "south-pointing chariot," which was a car constructed to use on land the compass which the West later adopted for the use of mariners. In this car there is pictured the figure of a man which apparently pointed with outstretched arm to the south, as the Chinese compass is said to do to this day, instead of the north being reckoned the normal as with us.

Antiquity of Skates

SKATES have been discovered at Spandau in Germany, according to a newspaper, which are believed to be at least 3000 years old; and like discoveries have been made in London and Berlin, as well as other places in Europe. The writer speaks about "the origin of skating"; but it seems highly probable that wherever there were men and ice in the same place, there would be skates, 3000 or 3,000,000 years ago.

H.

Homer Only One Person

A FRENCH authority on Homer, Mr. Van Gennep, will have nothing to say to those who have split the Iliad and the Odyssey into hundreds of fragments of all sorts of distant ages and by all sorts of different people, in accordance with the fad of "higher criticism," by which any living author can be similarly split up.

T.

The Trend of Twentieth Century Science

Adaptations of the Enemy

WHY should we hope that the law of variation will not apply to the bacteria?

A well known physician, writing in a popular monthly a sort of paean on the achievements of serums, antitoxins and vaccinations, practically gives away the case in the last paragraphs.

All these new methods rouse the blood to the formation of certain substances which either kill the invading bacteria or neutralize the poisons which bacteria generate. In the latter case the neutralization gives the normal blood ingredients the necessary time to destroy the enemy.

But there are indications that the bacteria are beginning to vary in response to the new situation, to adapt themselves to the blood environment which the animal injections had made so unfavorable for them. The diseases thus vaccinated or injected against, are beginning to reappear notwithstanding, and in worse form. The burglar is learning the trick of the new patent lock.

Biology might have known the inevitableness of this. And it might now surmise the probability of what is not yet proved: That even if some injection be discovered that does finally close the door against a given species of bacillus, and thus against a given disease, that does arouse in the blood a state which is finally preventive in that direction — it will be done at the cost of weakening its possibilities in other directions. In other words, other diseases will multiply their fatalities to keep up that total deathrate.

Humanity is not living properly; that is the sum of the matter. It is wasting vitality in sensualism; in its unspirituality it is almost disconnected from the real root of vitality. It is almost without hope, without joy, without brotherhood, without any of the touches which the soul can give to consciousness, and which, handed downward, finally come out as even physical health. We have plenty of apparatus of physical defense, but nearly all of it is as it were undermanned. Saliva and the other digestive juices are theoretically antiseptic, rarely actually so. The same of the nasal and bronchial and pulmonary mucous secretions. The blood should secrete bactericidal opsonins, and the bacteria left after their work should be the easy prey of the white cells or phagocytes. But these two lines of defence are as unreliable as the first.

The planes of human life are connected and we must live on all and healthily on all if we would have perfect health on any. STUDENT

Five O'clock

THE hour of the twenty-four at which we die, when we do die, appears to be still undecided. Some statisticians maintain that we — men and women alike — tend to die about five o'clock in the morning; one, that we tend to die about five o'clock in the afternoon; and one, astonishingly, that men favor the morning hour and women the afternoon!

The usual (morning hour) opinion was fa-

vored by Dr. Finlayson, on the basis of 13,000 cases; by Dr. Schneider, who examined 57,000 cases; and by Dr. Berens of Philadelphia, who had several thousand.

Dr. Marsh of New York, with 24,000 cases as his basis, favors the afternoon hour for both sexes; while Dr. Beadles divides the sexes.

So summarizes the *British Medical Journal*.

Physiology seems agreed that vitality is at its lowest at five in the morning, at its height twelve hours after. To this fact, and to the popular view that the night somehow "culminates" at about three in the morning, Dr. Marsh ascribes the preconception that death is most likely to occur before sunrise.

The two fives are curious. There seems to be a fixed physiological cycle unconnected with the sun, perhaps reflecting a private one of the earth's.

It does not follow, because reflexes are quickest and fever temperatures tend to be highest at five in the afternoon, that vitality is then at its height. Nor because opposite conditions obtain twelve hours earlier, vitality is then at its lowest. A man exhausted with worries or bad temper might have quickened and very exaggerated reflexes — that is, responses of muscles and nerves to sudden touches and other stimuli — and even a heightened temperature and circulation. In other words the five o'clock "heightening" of vitality may be apparent only, really meaning the need of the cells for a little food and rest. And the morning obverse of the condition may mean merely that the cells have all re-charged themselves and are quietly waiting to be called to duty. Five o'clock in the morning would in that case be the proper hour to get up. "Which is absurd," as a bed-loving Euclidian would say. But is it? For if the five o'clock exhaustion and depression theory is correct, we should certainly wait in bed for three or four hours to let this condition clear off — that is, till eight or nine o'clock. Surely it is *this* that is absurd and contrary to the universal experience of long livers and great accomplisshers.

Physiology has hardly yet begun upon the question of vital cycles. And it will not have time to begin while it thinks that vivisection is the path to real knowledge and that vitality, as a force *sui generis*, is non-existent.

STUDENT

The Pyramidal Earth

THE Abbé Moreau has been re-shaping the earth in order to account for the earthquake belts. The earth has been of various shapes in our day, and now it is pyramidal. But the pyramid is so extremely rude as to have been evidently forced for the theory. The four great oceans, the Pacific, Atlantic, Indian, and Arctic, are its four faces, all depressed. The apex is the South Pole. The corners of the base are the Baltic, Siberian, and Canadian planes. The edges running from these corners towards the apex are the western border of North and South America, a line from Iceland down through Egypt and

eastern Africa, and one from Siberia down through Australia. Where any of these four faces, planes, hollows, slopes up towards one of the bordering edges, is a place where slips tend to occur, that is earthquakes. In other words the Abbé's theory of earthquakes is one of slips pure and simple.

The main seismic regions are in two belts, practically at right angles to each other. One encircles the Pacific; the other girdles the earth, passes across the Mediterranean, the Azores, the West Indies, Central America, Hawaii, Japan, China, India, Afghanistan, Persia, and Asia Minor. The volcanic belts are the same. But there are two subsidiary ones, mainly extinct. One runs down the Atlantic from Iceland, through the Azores to Tristan d'Acunha. The other is parallel, but near the east coast of Africa. The points where the two belts, seismic and volcanic, intersect, namely Japan and Central America, have been supposed to be the two ends of an ancient axis.

The geologists seem to get the question more or less upsidedown. They want to see in the mountainous belts the cause of the earthquakes, leaving the location of the belts of mountain unexplained. Sometime they will have to regard the belts, and the shapes of the continents, and the lines of earthquake and volcano, as surface indices of deep structure and function, expressive of deep magnetic lines and currents. But that will mean giving up the conception of the nucleus as a structureless steel ball — which accounts for nothing.

STUDENT

Earthquake Rain

COMMENTING upon what is known as earthquake weather, *Nature* speculates upon the cause of the heavy mist that usually hangs over the scene of recent shock, mist precipitating into — or substituted by — heavy rain. One observer thinks that the heaving ground induces barometric alterations from the shaking of the overlying column of air.

The phenomenon seems more likely to be electric. It is known that mist droplets cannot form except upon a nucleus, and that this nucleus may be free ions or electrons. The latter indeed have been counted in a closed space, by Sir William Ramsay, by estimating the droplets of mist that formed upon them. It would seem possible that the region which is immediately to be the scene of an earthquake may experience a sudden marked rise or fall of potential, resulting after the shock in a thunderstorm and rain; the latter only, where the restoration of equilibrium was not sudden or violent enough to give rise to flashes. In either case the overlying column of air would be ionised and electrons freed. The "earthquake feeling," preceding a shock, would be the nervous tension set up by the greatly altered potential, in its turn due perhaps to changes of which we know nothing far down in the crust or even the nucleus.

But may not the earth herself have a preliminary "feeling" too? STUDENT

Yaks for Canada

IT seems that an attempt is being made to populate Canada and Alaska with the Asiatic yak. Writing in *Country Life in America*, Ernest Thompson Seton points out that there is a belt of unsettled country from Atlantic to Pacific, from Maine through Canada to Alaska, about 4000 to 5000 miles, which would be suitable for cattle raising if its winters were not too severe. As it is, the northern limit of cattle ranging is the south limit of the so-called Canadian fauna, a line crossing from the south end of Lake Winnipeg to the north Saskatchewan, then southward along the Rockies into the United States.

Attempts have been made with the bison and its various crosses with the long-haired cattle of the Highlands, but the bison has proved too wild and unmanageable.

But the yak, or woolly ox, has been formed by Nature for the northern ranges. [So the phrase goes, and it may be true; but probably more allowance should, in general, be made for the work of man. Considering the large part which his breeding and transplanting experiments play nowadays in the regulation of the earth's fauna, it is reasonable to surmise that in long past ages, when man worked on a larger scale than at present, as we know from the ruins of his buildings, he may have regulated the distribution of animals to a still greater extent.] It has long been domesticated. Its native haunts are the snow-clad hillsides of Tibet, even up to 20,000 feet above sea-level. But experiments show that it thrives near sea-level, as at Shanghai, Nice, Paris, and Antwerp. Its native food is a coarse wiry grass, but experiments at the London Zoo and at Woburn Abbey show that it will eat anything that common cattle will eat and will thrive on very poor fodder.

In size it resembles common cattle. In build it is like a common ox with a bison's hump; but the distinguishing feature is the coat. Three or four inches long on the upper parts, it lengthens on the sides, till the throat, shoulders, belly, and hams are covered with a dense hairy fringe that reaches nearly to the ground. The tail is enormously bushy, and coat and tail afford an ample protection, not only against flies in summer and frosts in winter, but against the attacks of wolves. It can be readily crossed with common breeds of cattle.

Mr. Seton tells how he visited Woburn Abbey, where this animal has been successfully bred, and obtained from the Duke of Bedford, for the Canadian Government, a present of six yaks to start a breeding enterprise on an experimental farm at Ottawa. If it be

MUSIC OF NATURE

THE one life within us and abroad,
Which meets all motion and becomes its soul,
A light in sound, a sound-like power in light,
Rhythm in all thought, and joyance everywhere—
Methinks, it should have been impossible
Not to love all things in a world so filled;
Where the breeze warbles, and the mute still air,
Is Music slumbering on her instrument.

Coleridge

successful, fresh importations will be introduced, and the animal distributed to other stations.

Brains as Fertilizer

MEN who work on a farm need education more than those who perform most other manual labor, says President Eliot. The demands on their intelligence are larger and more varied than in most other occupations.

Saxony Protects the Radium Industry

IT is stated that the government of Saxony, in view of the recent important discoveries of radium there, has issued a decree by which the rights of searching for and extracting radium minerals are retained by the State, which may, however, concede these rights to others. The purpose of this measure is declared to be, not to deprive people of their rights, but to ensure that the resources shall be used to the best possible advantage of the nation.

Without venturing to pronounce upon the questions of politics involved, which might commit one to views on state socialism or some such subject, one may commend the principle, which is that of checking the wasteful or injurious employment of natural resources that results from leaving them unguarded for indiscriminate exploitation. Doubtless the people of that country will endorse the action of their government as being taken in their own interests; and thus the government may claim, in that respect at any rate, to be representative of the people.

One would like to see the emergence of a wise and responsible unit of control in other countries, ready to take in hand the supervision of industries in interests broader than those of individuals. Such action would be far easier in the case of new industries than in that of industries already established on a wrong basis. We seem to be in a way to realize this ideal in the United States. Yet, let us not forget that if such a principle is to be made effective, the people must either be competent to govern themselves or must submit to governance by somebody wiser. And so it would be even more welcome to see such broad economical measures emanating from and practised by

private sources, as the result of free choice rather than compulsion. Rules are made for people who cannot rule themselves; and probably most of us are guilty of transgressing principles of economy. To that extent each one of us is responsible for the collective wastefulness of the community. H.

A Fungus that Absorbs Caterpillars

IN the case of a fungus called *Cordyceps*, found chiefly in New Zealand, the minute spores enter the bodies of large caterpillars and germinate in the blood and digestive canal. Eventually the threads of the fungus destroy the whole of the internal organs of the caterpillar, which becomes a firm mass of fungus tissue, covered by the caterpillar's skin. The fungus then sends up, usually from the head, its spore-producing branch, a rod-like structure often eight inches long. E.

Students'

Path

The Living Universe

HUMAN life is a thousand times richer than we have been led to suppose. We go our ways shut in by interests, desires, and anxieties, arising from some center within ourselves; our own minds are exuding clouds upon clouds about us, which darken the whole world. We are concerned, and perpetually at motion, with myriads of worthless personal thoughts and imaginings, and have no time left to consider things as they are. We fear to stop for a moment, lest someone else should get ahead of us. We are in dread of other people, of events, of everything. We are hypnotized by our personalities, and dare not look up at the great life which we share in. We call ourselves miserable sinners, and live well down to the name.

It is because we were allowed to grow up with no high ideal of the meaning of manhood, that this gray sordidness has come to surround all our thought and feeling. When we were children we knew better; we had some gleams, then, of a brighter and more glorious kind of life. It was as we came out from childhood into youth that the golden imagination faded away; it was then that we were bereft of all heroism and chivalry and magnificence. Life, it seemed to us, was to be all monotone and drab, a time, at the best, that was to be got through with as much enjoyment as might be possible under the circumstances, and very adverse circumstances they were.

No, there was probably no time when we realized the awful dullness that was closing upon us, but day slipped by after day, and year followed year, and the high hopes grew limper and more weather-worn with each returning season. They argue, sometimes, about the wisdom or folly of giving fairy-tales to the children—can we not remember that in childhood all this universe was a fairy-tale, and there was nothing in it not kindled with magic, and mysterious with a life of its own? Did we know of anything devoid of beneficence or the power of evil? Can we not remember the glamor that was on all natural things? The infinite subtlety of emotion that enfolded the mountains? The land beyond that was not of this world; heaven knows what laws might govern it; they were not the laws that govern these woe-begone things we are pleased to call the realities of life now. We dwelt in a living universe in those days; and whatever joys or sorrows may have visited us, we were not dreary; we were not dull or bored.

It is a mistake to laugh at the sorrows of children, and think them trivial besides our own, as we suppose them, so much greater sorrows. Whatever cause for grief invades us, its terror is half lost because our perceptions are so well toned down. But the grief that comes upon a child is absolutely seen and felt; it is a monstrous and terrorizing thing, realized completely; there is no mitigation of it; it inflicts its agony on every part of its victim. We can draw no conception, out of our dulled sensibilities, of what keen pain a child may be suffering. But there is also no joy in ordinary adult life like the joy of childhood. That is because the world is alive; alive and wise in every detail of it for the child. Alive—it is a pity one cannot unwrap that word, and bring out of it the hosts of its meaning. It means that you cannot turn anywhere without coming upon forces, influences, powers, romances, histories, adventures, magic, beneficence, power-

ful allies: that humanity is still not fallen; that the Golden Age is not a myth. While there is earth, air, fire, or water; while there are human beings and animals and growing things, you have more wonders and interest about you than could be unfathomed in a lifetime.

Now it is not the universe that has changed since we were children. That is the same now as it was then; every bit as potent, as glamorous, as glowing, as alive. The change has all taken place within ourselves.

What? We have grown up, have grown wiser now, have put away childish things? That is only half true, and the smaller half at that. Better say they have put us away, unwilling to have familiarity any longer with us, as our pure-heartedness fell. Children only wonder and revel, they do not understand. We have lost the power of wonderment; we have not enough life open to us for any revelling and—do we understand?

We were taught that it was all rubbish; our imagination was not disciplined, but discouraged away. We entered upon a thing facetiously called "life"; and it took hold of us, absorbed us, drew the souls out of us; treated us like the witch treated those poor adventurers in the fairy-tale, and turned us into a kind of stone.

As we grew up from childhood into youth, somehow or other instead of increasing for us, as you would imagine it should, life diminished, and one after another living marvel was turned into a dead and commonplace thing. Then there were a thousand and perils waiting to meet us in youth. Passion probably rose up and clamored within us, shouting that it really was the life we were seeking; that we should be restored to our living universe if only we would follow passion's lead. It did not lead us into life; it only lured us completely out, and banged the door of the living universe behind us, so that the last glimmerings of its ancient glamor and beauty were forgotten, and altogether faded away. Passion produced riots of emotion; a grand stir, no doubt, and hubbub within, tumult and unrest galore; but it was only a kind of imitation of life, and not the thing itself. Life leads to more life; but passion leads to—what? Reaction. Dulness. A sterner return than ever of those sweet things we so wittily name the realities of life.

Ambition may come with the same pleas and promises; but ambition is as blackhearted a liar as passion; he never had the golden key. You shall not find life by racing after any personal goal. You shall waste life, rather, that way. Gleaming mountains and all fairyland will slip by you, and you will be none the wiser or more enriched. You shall go out discontented: you may have had a wild and stirring time, but beauty will never have come near you; your whole life will have been largely in vain.

A dull world; a ditchwater and vapid universe; the reign of King Log and boredom only to be changed for that of King Stork and misery? Not so at all; but the same vibrant and alive place that it was when we were children; the same abode of wonderment and satisfaction, the same perennial embodiment of joy. You need never come near the dominion of King Log, and King Stork need have no terror for you; he may be instead a very beneficent friend. It is you who have changed, who have lost something, who have grown moody and indifferent and befogged.

We sometimes talk of the Golden Age and sometimes about the millennium; one in the far indefinite past, and the other in the far indefinite future. The truth is that the one and the other are so near to us that we may stumble upon them at any moment, and lose them again with as haphazard ease.

A hair perchance divides the false and true,
Aye and a single Alif were the clue,
Could we but find it, to the treasure house
And peradventure to the Master too.

It would seem as if it were but the lifting of a veil that divides them from us; but the turning of

a handle and we should see them; some little twist to our general consciousness, some little shock to send the dust of things and events flying, so that they should settle down again in their proper pattern—and we should be elate in the living universe once more, and marveling by what heroic endurance and folly we had lived through this our present nightmare state, and made it for ourselves to live through.

You remember the saying—"Except ye become as little children ye can in no wise enter into the Kingdom of Heaven." The Teacher of old knew why it was we had forgone the living universe, and were expelled from our native and wonder-laden Eden. Remember that the kingdom of which he spoke was the one imperative and all-desirable thing. It was to come on earth; it was within us; it was by no means alien, nor divided from us by death. Neither he, nor any great World Teacher had any other object for his mission than this,—to establish this kingdom, to make it patent and potent here on earth. "In my Father's house," he said, "there are many mansions"; but did he ever intimate that that house was beyond the grave, or that it was some other place than this round, much-populated earth of our own? "There shall be weeping and gnashing of teeth," he said; "the worm that perisheth not and the fire that is not extinguished." Gehinnom, he was referring to; the valley where they burned all the rubbish and refuse from Jerusalem: fires are always alight on any well-conducted dump in our own day; and verminous life is always at its work of devouring. And what shall happen to the selfish, to the misleaders and defrauders of men, but that they shall be flung aside by the Law; but that they shall stand out from the march of evolution; do stand out from it now; and are presently to find themselves alone—spiritually and mentally alone, cut off, abandoned by humanity that had gone forward leagues while they were sleeping or scheming? Both the heaven and the hell of Jesus are nowhere but here, upon this earth and among us men. Only the hell we know about well enough, whereas we have consigned the heaven to dreamland, to the impracticable; have made it the shadow, not the substance, of things unseen.

It is here already then, really; only concealed from us. We knew about it when we were children, even had free admission to it; but forfeited our right and knowledge as we grew up. Do not say that it was the things of this world that robbed us; but the way we looked at and treated those things. We might have learned all that they could teach us at school, and still maintained all the glory and insight. We might have gone out into the world, and made our living handling the bales and ledgers and tools divinely; directing the currents of the world's material life with as grand dignity as Apollo might direct the horses of the sun; and, in degree, with as grand beneficence. But there was a traitor within ourselves, selfishness; and all that we learned, we acquired with no compassionate motive. It was that we might outdo our fellows; that we might cut a fine figure in the school then, and after make a fine position for ourselves in life. There are two selves within us, the personal and the divine; and it is only given to the latter to enter into the living universe and the kingdom of heaven. Whatsoever we take into ourselves for the sake of what good it shall do to our limited, personal selves: that thing is not wholesome mental food; it is miserable un nourishing bran, it is sawdust, it is even poison. But whatsoever we take into ourselves for the sake of the universe that we may carry on the work of the universe, helping—that is the keynote—helping the rest of life to live; that is the Bread of life; whoso eats of it shall never perish.

You cannot gain any good thing without sacrifice; you cannot retain any good thing you may already possess without sacrifice; above all things no man can serve two masters. We can all choose between King Log and King Stork on the one

hand, and the Kingdom of Heaven on the other; that is the choice. We can choose, too, which of these our children shall inherit and grow up into; but if we make the bright choice, it means a giving up of fighting for self. If any life were analysed, it would be evident what the incidents were that drove it forth from Eden, and set the flaming angel at the gate. Children are not perfect by any means; and when you worship them unwisely, recognizing only the beautiful part, you do them almost infinite wrong. They do not live all or only in Eden; there are strange invaders there to disturb the quietude. From the first we may recognize the movings of selfishness: and it was selfishness alone that expelled ourselves.

The higher part of our nature is native to the heavens. It is a creator, possessed of the secrets of a wonderful beauty and wisdom. Where do all the marvelous harmonies of music come from? They all originate in man, and yet their workmanship proclaims them divine. So Gods would arrange the sounds, for the working of their delight and magic. All the great paintings and poems, too, came from man; and you cannot doubt that the men they came from saw into a deeper and more glorious world than this one we have made for ourselves. This is all proof that there is a power of vision that we have forgone; which, if we possessed it, would make us equal to the immortals. And yet these facts remain unnoticed, and form no part of our usual philosophy of life.

Child of this Universe, the truth is that you cannot live for yourself alone, but *must* set your hands to the work that all visible nature is engaged upon! Have we no conception how much there is to be done? All the world is to be made a garden and exquisite, and there is not any where to be any sorrow or selfishness left, or anything less than the fullest wisdom or divinest life. The Kingdom is to come upon earth; upon earth, mind you; upon this very earth we now so ignobly inhabit; to exist in this air we breathe; to reign in cities beautiful, that we shall re-build some day where these slum-haunted and vice-haunted human warrens are now. A pious aspiration merely? An impossibility? Rubbish, it is no such thing! This world now is the flower of man's animal nature and selfishness. But man is also divine; there are riches interminable and all unexploited within him; and these too shall have their bloom and fruitage, and their own day. But it shall come as we make it; only by working for it shall it come. We have had enough of creeds; we have had enough of all unbeautiful ideas. Lay to, for God's sake; waste no more precious time, but start in to help, to serve, to push forward. Abolish the nightmare ideas you have grown up in, and realize that your whole fate and your only means of progress lie in doing service. A living universe? Yes, and you are akin to it; you cannot escape from it nor from your responsibility to it. If there is much to be done before the Kingdom shall come upon earth, there is not one of us who has not to do his share of it. No miracle will be worked; there is no extrahuman power that will do the work we human beings are here in the world to do. The help is within ourselves; the divinity is within ourselves; the means of salvation are within ourselves. K. V. M.

"TRUE LOVE TO LIBERTY IS NEVER FOE"

TRUE love to liberty is never foe,
And he who loves alone is truly free:
Thus thought I when I heard the pulsing flow
Of mighty music rushing gloriously
Along the channels of unchanging law;
Thus thought I when I gazed upon the skies
And there the circling universe I saw
Moving obedient in glad harmonies
About a central inescapable power.
No sun, nor planet, nor wild comet's course
But owns that sway in every separate hour
Of all its centuries; to that one force
Freely it yields—as hearts that never rove
But pour their being in a single love.

Richard Watson Gilder in the *Atlantic Monthly*

THEOSOPHICAL FORUM

Conducted by J. H. Russell

Question Why the fear of death?

Answer Why this fear of physical death? Is it not through wrong teaching for ages, until at last the people have become ignorant of its true purpose and nature, and it remains simply an incomprehensible mystery to be dreaded? We have avoided even the contemplation of its possibility, and have been actually taught to look upon this truly most beneficent process of nature, as something most terrible and incomprehensible. Is it not just this state of ignorance regarding what we call death that causes our fear?

Let us endeavor to put aside this specter fear that has enchained our minds too long indeed, and acquire, in the light of Theosophical teachings, knowledge regarding this wonderful process of release from the prison house of flesh, and through Theosophy, having learned to know the inner spiritual unity of all, replace fear by trust in the Higher Law. Then can we meet this necessary experience, death, calmly and with unwavering courage.

The divine nature of the soul, if once really understood by men, would uplift and enlighten. What high thoughts have been expressed regarding the soul by those who have in their moments of intuition heard, as it were, its message. There is Wordsworth's beautiful utterance in his "Ode to Immortality":

Not in entire forgetfulness;
Nor yet in utter nakedness;
But trailing clouds of glory,
Do we come from God who is our Home.
Our birth is but a sleep and a forgetting,
The soul that rises with us, our life's star,
Hath had elsewhere its setting,
And cometh from afar.

And Emerson says:

There is no great and no small
To the soul that maketh all:
Where it cometh all things are,
And it cometh everywhere.

When we have acquired knowledge, and in our evolution have gained Soul-Wisdom, we shall contemplate calmly all things pertaining to nature and her marvelous and mysterious processes; knowing that the soul, the eternal pilgrim, must have periods of rest between the activities of successive earth-lives, and must have time and opportunity for assimilation of knowledge acquired in life's hard and bitter

school, in order to gain strength for future battles.

At the moment of what we call death, while the body is fast breaking up, the soul is passing through a solemn ordeal. In reality it is the first judgment day, for during these last moments when all seems over, and the last breath has been expired, we are taught in Theosophy that some time usually elapses before the inner man is released from the body. The consciousness is withdrawn into the inner recesses of the brain and he is reading the records of his past life in minutest detail, and seeing the complete chain of cause and effect. At this supreme moment, in order that the calm dispassionate judgment of the Higher Ego may not lose its efficacy, how necessary that we should realize the importance of a quiet peaceful atmosphere in the chamber of death.

While this retrospect of the past is taking place, the bodily form is breaking up under the pressure of a change in polarity. H. P. Blavatsky puts it thus:

When a body dies, it passes into the same polarity as its male, positive energy, and repels therefore, the active agent, which, losing hold of the whole, fastens on the parts or molecules, the action being called chemical. (*The Secret Doctrine*, vol. I. p. 572.)

According to William Q. Judge:

When we are awake, we are in equilibrium as to our organs and life. When we fall asleep, we are yet more full of life than in the morning. It has exhausted us. It finally kills the body. Such a combat could not be waged forever, since the whole solar system's weight of life is pitted against the power to resist, focussed in one small human frame.

Let us consider for a moment the unstable nature of these bodies of ours. The molecules are in a constant state of change, coming and going, ever like the water of a river constantly in motion, never the same. And, too, on leaving the body to pass into the outer air they have been impressed with some of the reflected consciousness of the man; have been colored just as the water of the river is colored by the earth strata it has flowed over, or the refuse it has carried with it.

This impress received by the molecules does not pass off quickly, and under the law of attraction, the grosser ones are attracted to the bodies of gross-minded persons, and the more refined find their attraction with those of more refinement of mind and body.

As none of us can therefore escape the influence of others, it is well to purify our lives, in thought and act, so that by the complexion we give our atoms, we can help others along the difficult path of evolution.

What more do we need than these teachings regarding this process of the soul's release from the body, to prove to us the divine nature of man?

Here we have the reviewing of all the past, the opportunities of judging and of making resolves for future lives, of seeing and recognizing our mistakes.

With the light that Theosophy throws upon the mysteries of life and death we need no longer tremble before nature's beneficent process, and

When our summons comes, go not like the quarry slave scourged to his dungeon;
But like the warrior, who, sustained and soothed by an unfaltering trust,
Wraps his martial cloak about him, and lies down to pleasant dreams.

F. E. L.

In the *Bhagavad Gītā*, Krishna says:
"All this universe is pervaded by me in my invisible form; all things exist in me, but I do not exist in them. Nor are all things in me; behold this my divine mystery; myself causing things to exist and supporting them all but dwelling not in them. Understand that all things are in me even as the mighty air which passes everywhere is in space. At the end of a kalpa all things return unto my nature, and then again at the beginning of another kalpa I cause them to evolve again."—Chapter ix.

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

Ignorance of the Bible

A REPRESENTATIVE of a society for issuing Bibles comments on the extensive and growing ignorance of the Bible and concludes that the circulation of the book is evidently not enough. But he adds figures showing that the circulation is enormous and that it is mostly applied to home consump-

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

mously that people will be compelled to read them?

If history could be taught on a more useful plan, it might dawn on the public mind that Bible-reading and the religious cultus based thereon are merely a passing phase. A book and a form of worship that has served us fairly well during a certain stage of our history will not

PUBLIC ROOM AND PLATFORM OF THE GRONINGEN (HOLLAND) LODGE
UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

tion. Nothing can be more obvious than that deficient circulation is not the cause of ignorance of the Bible, and hence that this ignorance cannot be met by increased circulation. Indeed the writer himself is constrained to say that his society is well aware that mere circulation is of little use unless it be accompanied by other means of grace, and he deplores the

decay of old-time piety; yet he does not on that account abate his appeal for subscriptions to the distribution funds. It is as if one should say: "It is no use stuffing the patient with food unless he can digest it; but, since we cannot mend his digestion, the only thing to do is to give him more food." Is it possible to increase the circulation of Bibles so enor-

necessarily continue to do so for all future time. Either the Bible, or the additional "means of grace" needed to supplement it, is inadequate for present needs, and perhaps both may be.

Theosophy would call attention to the existence of many other Bibles in the world's available literature, and recommend a study of

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

LAST Sunday evening at the Isis Theater, Mr. Percy Leonard gave a most interesting talk upon "Sowing and Reaping from the Theosophical Standpoint."

Mr. Leonard opened his subject by referring to the farmer, the dignity that there is in his occupation, and how, in the United States for instance, he has within little more than a century transformed the whole country from a wilderness to a fruitful garden. His courage and perseverance are derived simply from a conviction of the uniformity of natural law, and that as he sows, so shall he reap. And then the lecturer asked: Why should not we deal with life on the same principle and face the problems of existence with the same certainty of success? Every Christian professes to believe that whatsoever a man soweth that shall he also reap; but he cannot really believe it until he restores to his creed the forgotten doctrine of Reincarnation. But a child begins to reap from the moment it is born; yet the Christian scheme admits of no previous seed-time; although at the same time their Bible tells them there is no new thing under the sun.

A Theosophist has one great advantage over the Christian, said the speaker. A Christian experiencing sudden reverses of fortune ascribes them to Providence; but the previous easy comfortable ways and times were according to the same reasoning due to Providence and not in any way connected with his moral deserving. Why then may not the afflicting rod of the chastening of the Lord continue indefinitely, why if governed by caprice and not by law should it ever cease? But Theosophists believe that the evil harvest is in exact proportion to previous sowing and howsoever bad may be the reaping, they know that once the harvest is reaped, it cannot arise again from the same seed.

This teaching is a gospel of hope that straightens a man's backbone, stiffens his muscles, and gives indomitable courage. He may have made of his garden a wilderness; but at any moment he may change his cultivation and begin the planning of a Paradise whose beauty and usefulness know no limit.

The speaker also referred to the hypocrisy that one meets everywhere in life; but under the law of sowing and reaping, the hidden rottenness cannot be hidden for ever, but will at last show in the outer life, and each man will be recognized for what he is. According to Theosophy there is no favoritism in the divine government. Why should one child be blessed with an amiable disposition, good heredity, educational advantages; and another be born a congenital rascal in the slums? Theosophy teaches that each child has formed his own character in the past and that we are preparing each for himself the kind of life, the disposition, and character and opportunities, that will be ours in succeeding lives.

A man who resolutely sets himself to make another start in life need not expect to have his ancient load of sins forgiven; but from the very fact of his newborn endeavor his whole obligations change from pains and penalties to tuition and experience. His soul is operative in his daily life and sheds an influence and radiates a power that changes everything to gold.

OBSERVER

Ignorance of the Bible

(Concluded from Page 10)

biblical literature in general; and it would suggest, as a means of grace, a recognition of the Divinity of Man—the cardinal principle of all these Bibles. In the light of this understanding, our own Hebrew-Greek-Syrian Bible would acquire new force and new meaning. The stories of the Old Testament, which are for the most part sacred allegories constructed out of historical materials, are of no use so long as interpreted in their dead-letter sense; while the sayings of Jesus and his apostles have been converted by their religious interpreters into something too feeble to impress the present age.

Theosophy takes these teachings of Jesus and Paul, compares them with the teachings found in connexion with other religions, and shows them all to be part of a universal and eternal Religion, taught in all ages by illumin-

Sven Hedin and Tibet

DR. SVEN HEDIN'S recent lectures on his travels in unknown Tibet have excited great interest in London, and, as Dr. Hedin is to spend a month in England and deliver similar lectures all over the country, the accounts which he gives of Tibet and the Tibetans should have a marked influence upon public opinion here, opening the eyes of many who hitherto have regarded Eastern peoples as in all respects vastly the inferiors of Europeans.

In CENTURY PATH, volume x, number 43, appeared some exceedingly interesting extracts from letters written by Dr. Hedin from Shigatse, where, by the courtesy and kindness of the Teshu Lama, the spiritual head of the northern Buddhist Church, the explorer was privileged to witness the great festival of the New Year, and to go freely where he would, making sketches and taking photographs, in

ated Messengers, adapted into various forms according to the needs of time and place, and afterwards made the basis of dogmatic religions. To clear these teachings from the superincumbent mass of doctrinal interpretations and to disinter the original meaning, requires the application of the intelligence given by a study of Theosophy.

Jesus the Christ was something more than a saddened saint preaching a nerveless form of quietism and fixing all our hopes on the chance of an escape from life into a future unearthly paradise. This idea of religion marks a period of decay; it is found in other religions besides the European, and in these we are quicker to recognize its existence. Jesus was a Master of Wisdom, who taught his disciples how to enter the Path of liberation from the enthrallment of the senses and desires and how to become perfect Men. His teachings and those of Paul are full of Theosophy, but none of the churches seem capable of interpreting them.

To forgive without forgetting, is again to reproach the wrong-doer every time the act comes back to us.—*Gems from the East.*

the great temple of Teshu Lumpo and the universities and theological colleges attached to it. Greatest of all honors, he even had two lengthy audiences of the Teshu Lama himself.

In his public lectures, Dr. Hedin has fully substantiated those passages in his letters in which he referred to the Teshu Lama in terms of the deepest admiration and respect. To an attentive audience which filled the Queen's Hall—one of the finest halls in London—to its utmost seating capacity, he spoke of the ineffaceable impression which the Teshu Lama had made upon him, and said he felt that this young man had "attained as near to divinity as it is possible for mortal man to do."

The explorer also spoke of the deep religious faith of the Tibetans and the solemnity and grandeur of many of the ceremonies which he witnessed. He laid particular emphasis on the beauty of the music, saying on one occasion,

The hymns of Tashi Lumpo made a deeper impression upon me than even the church music in Kansansky Sobor in Petersburg, or Uspensky Sobor in Moscow. They are full of faith and longing, of mysticism and harmony, and they lead the listener away to the land of dreams and hope.

And on another occasion, referring to the same subject, he said:

The hymns were mysteriously and marvelously beautiful—as if the singers were already nearing the gates of Nirvāna.

He gave a vivid account of the beauties of the holy lakes of Tibet, overshadowed by great mountain ranges, and of the sacred mountain, revered by Hindūs and Buddhists alike, on which is said to be situated the paradise of Śiva, and whence the god descends once in every year to swim across the holy lake in the form of a swan. Whilst crossing one of the most beautiful lakes in a tiny boat, Dr. Hedin was overtaken by a sudden storm. The boat speedily began to fill with water and he was obliged to bale for dear life, whilst his men pulled for the shore with all their strength. Even at this moment of danger, Dr. Hedin was able to admire the lovely effects of sunshine and storm-cloud on the lake, and observed that owing to the clearness of the water, he could see the surrounding mountains right through the crests of the waves which rose high above the little boat. He and his companions had a very narrow escape from drowning, but just managed to reach shallow water before the boat was swamped. Some lamas from a temple near by helped to get them ashore, lit a fire for them to dry their clothes, and brought them food. Hedin afterwards learned that the lamas of the monastery on the opposite side of the lake, who had shown him considerable hospitality and from whom he had parted that morning, were praying and burning candles for his safety during the time that the storm lasted!

Of the character of the Tibetans the explorer said:

I love them, I feel the deepest sympathy with them; they were always kind and polite and hospitable to me, and went as far as they possibly could without being disloyal to their own country, and after half a day's acquaintance we were as if we had known each other from childhood.

And again:

The people [of Tibet] have been very kind to me. It is a great mistake to suppose that they are hostile, I never found any sign of hostility. Even when they ask you to leave the country they do it in such a pleasant manner that one is almost glad to go.

Dr. Hedin has a strong sense of humor, and this faculty must have been tested to the uttermost during the terrible hardships and utter loneliness of his journeys in the Trans-Himalayan Range and the mountainous region immediately to the northward. In the Karakorum Pass, the caravan track was strewn with abandoned merchandise and the frozen carcasses of ponies and sheep. The explorer counted 62 dead animals in an hour's ride, and the animals of his own caravan perished at the rate of two or three a day. The temperature fell below the freezing point of mercury.

But nothing could cool the explorer's ardor or weaken his determination to fill in the "great white patch" on the map of Tibet. All kinds of obstacles had to be overcome, but in the end he succeeded in accomplishing this almost herculean task. The most interesting of his geographical discoveries were the true sources of the Brahmaputra and the Indus. That the source of the Indus was previously known (though of course not to Europeans) appears clear from the fact that the spring from which the stream issues, called by the natives "The Lion's Mouth," was or-

namented by carved stonework with sacred inscriptions and the statue of a god. It is much to be regretted that Hedin should have so far forgotten that respect which he professes for the beliefs of others as to "annex" this statue.

In spite of all his hardships and dangers, and his long absence from Western civilization, it was with the utmost regret that the explorer finally bade farewell to Tibet, with its mountains of eternal snow, its holy lakes set like gems between the mountain ranges, and the veil of mystery which hid from his sight the greatest wonders of the Forbidden Land. He is convinced that the Tibetans have been induced by his successful intrusion to adopt more stringent precautions than ever to exclude foreigners, and that it would now be practically impossible for a European traveler to cross Tibet. Our Periodicals

THE first number of Vol. XIII of *Theosophia*, the organ of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, of which Katherine Tingley is the Leader, has just appeared and been sent to us by the kindness of the editor, Dr. Gustav Zander. The paper opens with an article by Kenneth Morris, who says among other things: "High ideals, that is what we need! Ideals to follow with enthusiasm every hour of the day, and not only to bring forth now and then as subjects for public lectures. If the simple ideals and teachings of Theosophy were living in our hearts and minds, how would they not lead us forward to a higher path. . . . According to the Law of Nature we are always builders—we cannot avoid being so, though we may build for the whole race or for our own little personalities. When our aim is small and narrow and we are seeking nothing but our own pleasure and advantage, then we are robbing our people and our age of work and power which rightly belongs to them, and many promising thoughts may have to die for want of the right kind of food."

A. v. G. [Anna von Greycz] writes about *Theosophy in the Home*. "What has Theosophy to do with the home? Everything, as Theosophy is the real Science of Life, the Art of Living; and the Theosophical term that gives the key to this science is Rāja Yoga. 'Rāja Yoga,' says Katherine Tingley, 'is the perfect balance between all the faculties of man; and true comradeship, i.e. devotion to the interests of others, is one of the fundamental conditions for reaching Rāja Yoga.' There is not one department of human life which gives opportunities to practise true comradeship more abundantly than the home-life. Those persons are in the minority who do not in some way, in some sense, partake of home-life; and every home ought to be able to be a Rāja Yoga School in its widest sense, embracing all the members of the family, old and young alike. For is there anyone so old or so experienced that he has no need of learning more of true comradeship? Is not devotion to the interests of others a task that will suffice for the whole life—yes, for more than one life? Is it not our first and greatest duty first to work for those who have been placed near to us by Karma? Is it not by the purity and beneficent power of the homes that the whole of humanity will finally be able to rise out of misery and suffering?"

Capital Punishment—a Danger to the Liv-

ing, by G. Z., and *The Occult Meaning of Silence*, by Amélie Cederschiöld, conclude this carefully edited paper, which also has a department for young people.

The price of *Theosophia* is 5 kronor per year, single copies 50 öre.—From *Björneborgs Tidning*, Finland, Jan. 29, 1909, under the heading: "Art and Literature."

A Centenary

IN the great glare of the Lincoln centenary the fact that Charles Darwin was born on the same day has receded in prominence, and yet, in his way, the great naturalist was a pioneer of modern conditions not less wide in their scope than was the other.

What modern thought would be without the idea of evolution, with humanity in the West still shackled with religious dogma and stagnation of thought, it is hard to guess.

But there was a stumbling-block of serious proportions. Physical evolution alone as an idea in the Western mind soon led to its obvious and logical conclusion—materialism. This was not much better, if any, than the theological pabulum which had long lost all its nourishing properties. The only point gained was the freedom of the public mind, and that freedom was yet capable of leading it to mental and moral perdition for lack of guidance or even knowledge of *real* evolution.

Here came one to the rescue who stood alone in the crisis, for it was a crisis, and being alone, was not a popular philosopher. But she refused to let the human mind go back to the lethal sleep of materialism and dogma. H. P. Blavatsky brought the doctrine of dual evolution, so to call it, once more before the world that had forgotten, or like the Ephesians, had "not so much as heard whether there be any Spirit."

Darwin and his school brought forward a sketch of physical evolution; H. P. Blavatsky made his gropings take a practical direction, by showing that with emendations and prunings, the other half of the problem of evolution made a complete whole, *true to nature*. Not only this, but she showed how the dual principle inheres in all manifested things, from man's physical body and his spiritual self to the visible and invisible, outer and inner, higher and lower selves of planets and atoms and all creation; in short, she brought before an unwilling world the doctrine of the divinity of man, for the sake of the few who were then thirsting for the lost word of Truth.

Reading her books, one is forced to the conclusion that she had an inexhaustible fund of knowledge, but almost confined herself to such things as some groping thinker had touched upon—filling in, correcting, suggesting, quoting, and in every way encouraging independent thought, while refraining in a great measure from bringing forward too much new matter which might, however true, be taken as dogma by those lazy minds who *will* not think for themselves or anyone else.

If this view is correct, let us honor all the more those sincere thinkers who have dared to push ahead and so open the way for those who possess the light of knowledge to shine down a ray here and there through the cloud of smoke and dull flame that the world calls knowledge and philosophy today, and not regard them as merely old-fashioned, unenlightened gropers in the dark. P. A. M.

Art Music Literature and the Drama

An Ancient Sun-Myth of the Vancouver Indians (Concluded)

NOW the Sunmaker who was never born and whose father dwelt in the blue sky, made a great trap and set it in the sea.

The next morning he visited the trap.

"Trap, what have you caught?" he said.

"A bullhead," answered the trap.

"I am not hunting for bullheads," said the Sunmaker, and he departed.

The next day he came again.

"Trap, what have you caught?" he said.

"A beaver," answered the trap.

"I am not hunting for beaver," said the Sunmaker.

The next day it was a salmon, and after that a seal, an otter, a dogfish, a trout, and a whale, but to each of these he replied, "For such I do not hunt," and he let them all go.

At last he said one day: "Trap, what have you caught?"

"It is a Sisautl!" answered the trap.

"Ah! that is what I seek," said the Sunmaker, and he took it home with him.

"Mother," he said, "I have caught a great salmon. Tell all our friends that we may make a feast with them. Go outside and bring it into the house that we may prepare it."

He meant it to be a surprise for his mother, and he thought to himself of her amazement when she saw what his salmon really was.

But she was long in coming; so he went outside to see what was the matter. There she sat all huddled in a bundle—turned to stone at sight of the terrible Sisautl.

"Mother," he said, "you always do queer things when you are pleased. But stop now and help me to carry in the fish."

Never a word she answered for she was turned to stone.

Then he remembered that he himself was free from its evil power, for he was not born of earth. And he knew that she was dead.

But he found Living Waters and sprinkled her until the life came back into her, as she had once restored the life to him when he was nearly drowned through clinging to the long brown tresses of his kelp princess.

By this time all his friends in the village had come to see the great fish which the Sunmaker had caught, and one by one as they gazed on its terrible eyes, they too were turned into stone. And he was kept busy for a long time sprinkling them with Living Waters to restore them all to life.

So they feared him and his magic, and they were glad when he left the tribe.

Now the Sunmaker was the best Bowman in the tribe or in many tribes. He could shoot an arrow farther and harder and straighter than any of the Indian warriors. Wistfully he looked into the blue sky day by day and he longed to seek the old, old Sun, his father, from whom he was named.

"I am a good marksman," he said to himself, "why should I not shoot an arrow into the sky?"

So he shot and shot, arrow after arrow, until after many days an arrow stayed fast in the blue sky far above him. Another he shot into

the first so that this also stayed fast. For many days the Sunmaker shot his arrows; many were the arrows that flew to the sky. One arrow he fixed fast in another until the great day came when the chain of arrows reached from the sky to earth.

By this arrow chain the Sunmaker climbed, until he came to the floor of the sky. Far, far in front of him led a Path. Behind him also lay the Path by which he came, but soon it was lost to sight. Forward he traveled, for this was the Sunpath, and it seemed to him as if he had traveled that road long ago. Indeed he half remembered that he must travel forward on that Path, never backward. Many

REJOICE

"REJOICE," said the Sun; "I will make thee gay

With glory and gladness and holiday;
I am dumb, O man, and I need thy voice."
But man would not rejoice.

"Rejoice in thyself," said he, "O Sun,
For thy daily course is a lordly one;
In thy lofty place, rejoice if thou can;
For me, I am only a man."

"Rejoice," said the Wind, "I am free and strong:
I will wake in thy heart an ancient song;
Hear the roaring woods; my organ noise!"
But man would not rejoice.

"Rejoice, O Wind, on thy strength," said he,
"For thou fulfillst thy destiny;
Shake the forest, the faint flowers fan;
For me, I am only a man."

"Rejoice," said the Night, "with moon and star;
The Sun and the Wind are gone afar;
I am here with rest and dreams of choice,"
But man would not rejoice.

For he said—"What is rest to me, I pray,
Whose labor brings no gladsome day?
He only should dream who has hope behind.
Alas for me and my kind."

Then a voice that came not from moon or star,
From the sun, or the wind, roving afar,
Said, "Man, I am with thee—hear my voice."
And man said: "I rejoice."

George MacDonald (Selected)

a weary journey he spent on the Sunpath until in the end he came to a great white house in which lived an old, old man.

"Who are you?" asked the old man.

"They call me the Sunmaker," he answered.

The old man's face lit up with joy.

"Glad indeed am I that you are come, for you are my son," he said. "I am very old and my work is overmuch for my strength. I want you to help me."

"What, then, is your work?" asked Sunmaker.

"I have to carry the sun round the earth every day—a weary journey it is," said the old man.

"That! Why I could carry the Sunball easily enough, for I am young and strong," said Sunmaker.

"Yes, my son, you can carry it well, I know, but terrible would be the result if you fail to carry the sun in its accustomed way. Then

there are your aunts to consider. For they must be treated gently and with care, else none may tell what trouble may come about.

"My aunts!" said Sunmaker, "who are they?"

"The clouds are your aunts," said the old man. "They must not be jostled and roughly pushed aside, for that is not the way to treat one's relatives. When you meet them in your path round the sky you must gently push them aside without roughness or insult. Slowly and carefully must you go lest you offend them."

"I will do it," said the Sunmaker. And the old man gave him instructions as to how to carry the sun.

"Hold fast," he said, "go slow, yet not too slowly. Nor must you go too fast or the days will be short. Neither to right nor to left may you wander, but straight through the day must you travel to the journey's end, and then alone may you rest."

Full of joy at his great privilege the boy Sunmaker started on his way. Gently, gently he pushed his aunts, the clouds, aside, for they were very old, old from the beginning of things. Easily the Sunmaker carried the Sunball on his strong shoulders from dawn to day. He swerved neither to the right nor left, and sturdily he strode towards the arch of the sky.

"This is easy," he said to himself. "I can carry the Sunball all day long and help my father."

But his patience wore on and towards the noon hour he began to tire of his task.

"This great task is too easy," he said. "Why should I go so slowly? And now I think of it I was told not to go too slowly lest the day be too long." And he looked down on the earth where the bright light of the sun he carried crept slowly, slowly on.

And at the noon hour in the height of his glory his patience forsook him.

"I can soon finish this journey if I wish," he said. "I am not an old, old man to do as the old men do. My way is just as good."

And he ran on towards his journey's end.

So swiftly he ran that he missed the Path. Quickly he brushed aside his aunts, the clouds, and the earth began to burn with great heat. Luckily his father saw the smoke and flames and hastened after his unfaithful son.

"I see that he is running," said the old man. "I must hasten to save the world, before it is burnt altogether."

So he made a great effort and ran fast after his son. Just in time he caught the Sunmaker and took the Sunball from his shoulders, after which he again carried the sun himself, slowly and carefully, neither too fast nor too slowly, and he always gently pushed aside his old aunts, the clouds, who were old from the beginning of things. And although the earth suffered much damage when it caught fire from the Sunmaker's impatience, the damage has grown less with time.

Which shows that the old way of journeying along the Sunpath is best after all—neither too fast nor too slow, steadily and surely to the journey's end. This was learned when the Sunmaker was in Fatherland. STUDENT

AMONG the workers for humanity of today, Elena, Queen of Italy, takes a very high position in the hearts of all people who love courage and devotion to the highest ideals. Her self-sacrificing work and splendid organizing ability shown during and after the appalling scenes of the recent earthquake, have riveted the attention and claimed the admiration of the world. The purely unselfish devotion of King Victor Emanuel and his noble consort has proved once again that the "business of kingship" still contains as many opportunities of service to humanity as in the medieval or antique world, perhaps more so; it offers a field for the highest qualities of the soul. No passive nonentity, no selfish voluptuary, can creditably occupy a throne today.

Katherine Tingley has pointed out that every woman has the power to help, in a degree, to elevate the race by her intelligence, her loving patience, and her courage in right action. If this is in the power of even the humblest, how great must be the opportunity in the hands of a queen or any leader of society!

Ever since she attained her high position Queen Elena has been as devoted a worker for her people as she has been a true and perfect wife and mother, and during the earthquake she exerted herself to the utmost. For ten days she toiled without ceasing at Messina and Reggio, directing the work of rescue, tending the wounded and dying, and caring for the children with her own hands. In one of the terrible panics that arose during the secondary shocks, she was considerably hurt and bruised while arresting the mad rush of a crowd from a hospital. Having to return to Rome at the urgent solicitation of the king and the physicians who feared for her life, she immediately set about organizing arrangements for the permanent welfare of the sufferers, particularly the great number of orphaned or injured children whose deplorable plight appealed deeply to her large mother-heart, all aflame with noble compassion.

"Noblesse Oblige"

Nowadays, when monarchs are practically debarred, for political reasons, from going to the front in warfare, many rulers must be glad to seize opportunities of showing courage on occasions of risk such as arises during epidemics or disasters by flood, fire, or earthquake; but the royal and aristocratic women who have given equal proofs of splendid heroism, would never have been criticized if they had been content to give their assistance from

THE occultists, who regard Physical Nature as a bundle of most varied illusions on the plane of deceptive perceptions, who recognize in every pain and suffering but the necessary pangs of incessant procreation; a series of stages toward an evergrowing perfectibility, which is visible in the silent influence of never-erring Karma, or Abstract Nature—the occultists, we say, view the Great Mother (Nature) otherwise.* Woe to those who live without suffering! Stagnation and death is the future of all that vegetates without change. And how can there be any change for the better without proportionate suffering during the preceding stage? Is it not those only who have learnt the deceptive value of earthly hopes and the illusive allurements of external nature who are destined to solve the great problems of life, pain, and death?

Helena Petrovna Blavatsky

[* than do Materialists]

a safe distance. Among others who have stepped forward in the moment of dire need, Queen Marie Amélie of Portugal, a qualified M. D. and trained nurse, holds a noble record for her practical and personal hospital service during fearful outbreaks of diphtheria and bubonic plague. Even the much-criticized Empress Eugenie courageously visited the hospitals at Rouen during the terrible cholera epidemic of 1866, and also risked the loss of her beauty—no small thing in her position—

by going to the Paris hospitals to give much-needed encouragement to the doctors and nurses in the midst of an extremely violent outbreak of smallpox.

In studying the careers of heroic women in every rank of life and at every period of history, it becomes difficult to draw a distinction between "moral" and "physical" courage. When a brave stand for principle was demanded, how often has a woman sacrificed herself, regardless of moral or physical consequences, on the altar of duty; even, as in the case of Joan of Arc, when hope had been abandoned by men; and how often has a wise and brave woman roused the latent courage in a man! For a recent example of moral and physical courage in a comparatively humble life let us not forget the admirable service in saving life rendered by Miss Kate Gilmour, stewardess of the S. S. *Sardinia*, when on leaving Malta a few months ago a fearful panic, caused by fire, broke out among nearly 140 Arabs and others. Miss Gilmour has been awarded the silver medal of the British Insurance Corporation, "Lloyd's," given, but rarely, to those "who have by extraordinary exertions contributed to the saving of life at sea." The medal was first conferred in 1837, but no woman had previously received it, though Mary Rogers, stewardess of the *Stella*, wrecked near the coast of France in 1889, would undoubtedly have had it if she had not perished through giving up her lifebelt—the last—to save the life of a passenger.

Theosophists are often asked for some evidence that there is a principle in man higher than the ordinary instinctive consciousness, or the brain-mind; for proof of the existence of the soul, in fact. What more conclusive proof, subtle though it may seem to some, can be imagined than the occurrence of deeds of heroism which absolutely disregard the comfort of the body and even destroy it? Under pressure of extreme peril or suffering it is perfectly natural for the personal self, the human animal, to seek flight or to fight des-

perately for self-preservation, regardless of others; yet, when the time of trial comes, the unexpected often happens, the baser instincts are checked by a giant power which starts into view from the mysterious background of Being, causing the petty personal self to yield its ease and comfort, even its life, for others, or to fulfil a sublime call of duty. This mighty influence comes from the higher Ego, the "man for whom the hour shall never strike," the divinity within. Indeed "Man's extremity is God's opportunity."

That the inner spiritual self does not illuminate the pathway of every human being today is because so many have deliberately rebuffed it by the exclusive cultivation of the material and the sensual parts of their nature. The heart-light is eclipsed, and much suffering must be experienced before the intuition can take its lawful place as the guide of the reasoning mind.

Quiet, persistent devotion to the simple duties of life, with a constant effort to realize the full meaning of Brotherhood, the love of the neighbor, is the only way to build the mystic ladder upon which the angelic messengers can descend. Then, when great opportunities come the higher self can act with mighty power and men will say, "Lo! here is one who *knows*."

STUDENT

What One Patriotic Woman has done for Switzerland

"GOD made the country, but man made the town," is an old saying, but this was before man tried to make the country as vulgar and townlike as he could. Towards his latter years, John Ruskin suffered acutely from the sight of the destruction and disregard of natural beauty—a priceless heritage which has taken ages of patient toil of plant and wind and water to create, and which, once lost, is not to be easily restored—owing to the spread of our materialistic civilization, whose luxuries and artificial wants must be supplied at all costs, as regardless of the ruin of the peaceful beauty of nature as of the millions of workers who are killed or injured annually in the dangerous occupations necessary to supply them.

Ruskin's despairing cry of grief at the increasing materialism of the nineteenth century as shown by the outer symbols of desecration produced by the railroad, the mine, and the factory chimney, the polluted river or the

smoke-laden sky, has not been entirely in vain. Efforts have been made in various countries to preserve unsullied some localities hallowed by tradition or renowned for beauty; but there is a terrible "white-man's-burden" of indifference and greed to be lifted off the back of the (so-called) civilized races before a healthy public opinion will render impossible the vulgarization or the wanton destruction of the simple natural beauties of earth, air, and water.

mountains or in fleeing foreign visitors in staring hotels! It is not so. Switzerland is a land of solid institutions, many of which might well be imitated by other States; but a little while ago the thinking people in that country—one of the most cultured and probably the freest and most democratic in the world—awoke to the fact that the cosmopolitan vulgarization of their fatherland was becoming a real danger; yet it remained for an earnest and truly patriotic woman, Madame Burnat-Provine, of Tour-de-Peilz, Canton Vaud, to protest effectively, by establishing a few years ago, the "Ligue pour la Beauté," an association whose object is to stem the tide of the commercial vulgarization of Switzerland, and to prevent it from becoming a sort of glorified Coney Island.

At this time when there is dawning some idea of the Brotherhood of Nations, even if only on the material and lowest plane, today when suggestions of a World-Federation are becoming heard, a spirit of national pride is also rising in many of the smaller nations, such as Ireland and Sweden, which would preserve, cultivate, and strengthen the characteristics, good qualities and possessions peculiar to each. Switzerland has felt the touch of this new life, as may be seen from a perusal of the objects of Madame Burnat-Provine's League of Beauty. They are as follows:

- (a) To preserve places of scenic beauty from disfiguration or unjustifiable exploitation.
- (b) To preserve the characteristic monuments of the country.
- (c) To preserve the native fauna and flora from extermination.
- (d) To preserve the native dialects, manners, customs, and folk songs.
- (e) To preserve good native rural and urban architecture, to stimulate a healthy development of the building, and to protect the native trade (in building) from being contaminated by the barbarities of the present day.

After a checkered career this excellent movement has triumphed over all attacks, and its protest against the demoralization of public taste and its efforts to cultivate a higher patriotism and self-reliance among the people are being supported by several daily papers. Another society, the "Ligue pour la conservation de la Suisse pittoresque," has similar aims in part, and publishes a well-illustrated magazine written chiefly in French and German. We heartily wish good success to all such movements for the real benefit of the race, for the race needs them.

BERNINI'S DAVID—BORGHESE MUSEUM, ROME, ITALY

A speaker at the recent Lincoln centenary, in repudiating the suggestion that Lincoln would have been better prepared if he had been brought up in a city, said that Lincoln had the inestimable benefit of spending his youth with the blue sky over his head, instead of smoke or skyscrapers.

Switzerland is called the playground of Europe, and to the ordinary tripper it is not unnatural that the hotel and tourist traffic business should seem to be the mainstay of the Republic, and that he should fancy the whole interest of the inhabitants is concentrated on the building of new cog-railroads up

OUR YOUNG FOLK

In Pisa

THE cut shows the Campanile or Leaning Tower, and the rear of the Cathedral of Pisa. These form part of the world-famous group of buildings consisting of the Cathedral, the Tower, the Baptistery, and the Campo Santo. They were begun in the eleventh century and many great architects and artists labored in their construction and adornment.

The Baptistery contains the most beautiful pulpit in the world. It was made by Nicolo Pisano, a native Pisan. Around its sides in panels are sculptured scenes from the Bible and it is supported on columns resting on the backs of lions that are following each other in a circle. There is a spiral stairway leading into the pulpit and the whole is done in white marble. It is so beautiful that one can but believe that someday a message worthy of it may be delivered from it.

When this group of buildings was begun Pisa was a great seaport and one of the most flourishing and important cities in the world; its harbor was filled with vessels from all over the known world. Now it is the sleepest old town in Italy. Many strangers go there to see these beautiful buildings but most of them stop only a few hours.

If Pisa interests you enough to make a longer stay, you go to a hotel that was a princely palace of a bygone time, with something of its faded splendor still clinging to its furnishings and decorations. One can but wonder what must be the feelings of an old palace that has sheltered some family for generations and watched the children grow into men and women within its walls, when it finds itself abandoned by its owners, fallen into new, and strange hands, sold and bought many times, and at last used as a hotel, with strangers from foreign lands occupying its rooms and dining in its banquet halls.

Sowing Wild Oats

SOME time ago the idea was prevalent among a certain class of people, that men would be stronger, more able to cope with evil and present conditions of life, if they had in their youth passed through and yielded to the various temptations which beset that age. And it is prevalent still among a certain class, notwithstanding the terrible lessons which are an open book for all the world to read.

The strong who have been subjected to these experiences, have come out victorious, though if all their strength had been used to move forward, and not a large part of it in simply regaining ground they had lost, none can say what their condition might have been. These examples have covered for the eyes of some all those hosts whose lives have been

THE CAMPANILE AND CATHEDRAL OF PISA

WRATH is cruel, and anger is outrageous.—

Prov. xxvii. 4.

ANGER . . . makes a man's body monstrous, deformed, and contemptible; the voice horrid, the eyes cruel, the face pale or fiery, the gait fierce, the speech clamorous and loud. It is neither manly nor ingenuous. It proceeds from softness of spirit and pusillanimity. . . . It is a passion fitter for flies and insects than for persons professing nobleness.

Jeremy Taylor

weakened, or ruined, or who have at once been swallowed up in the vortex. And on the other hand they have observed certain characters who have been screened from great temptations, but who were undeveloped in the first place, and in no way fitted to master conditions, and they have attributed their inability to their protected lives, rather than to the real cause.

It is a calamity to the nation that there are any who have the directing of young lives who look indulgently on the practice of "Sowing Wild Oats." It cannot be forgotten that as we sow, so *must we* also reap. It is impossible that a body which has been so used, can become as good an instrument as one which has been trained differently. The strong can come out of it, and use their experience to save others from the same school, but the finest edge has been taken off their tools, whether it is ever recognized by them or not.

Would we expect one to be better able to cope with *physical* disease because his body had passed through these diseases? Would

we expect one to be more capable of dealing with sewer gas by going in and breathing it?

Anyone who has been so trained is pitifully handicapped at the threshold of life, and any who look indulgently at this method of training must have utterly lost sight of the purpose of life.

There is another way of learning to meet the world and its evils, which is applied in the Râja Yoga Schools. It consists in the early training in self-mastery, in self-knowledge. The students in these schools by degrees face evils in their strength, and not in their weakness, and are protected from the grosser forms until something is developed in them stronger than the temptation. And the Râja Yoga Schools are in a position to guarantee that a student who has really been under this training would put to shame one who had been in the "Wild Oats" school, in his knowledge of life; of human nature and of his own particular nature; in his power to sift men's motives; in his quickness of perception; in his self-poise, and in his mastery over the conditions to be met with in the world. The harvest of this planting will be a higher manhood than is ordinarily conceived possible. STUDENT

Kindness to Animals

NOT far from Boston is a farm called Red Acre, where for several years a most humane and charitable work has been carried on. Red Acre Farm is, in fact, a hospital and home for horses.

There are many people who own horses but who have not the means to enable them to consider their animals as they might wish. They often have to go on driving them long after they have noticed that the horses need a rest. At Red Acre Farm the horses of poor people can get the rest they need and medical care too, if it is necessary. No charge is made, and other horses are loaned at a slight cost, or even, sometimes, without any fee, while the weary or sick animals get the treatment they need.

This is only one branch of the work at Red Acre Farm, however. Horses rescued from cruel drivers are received and nursed kindly. Old horses too feeble for use, are also taken, and either cared for, or destroyed in such a way as not to cause them suffering. A great deal of misery is thus prevented. Have you ever thought what it must be to be an old, sick, neglected horse, for whom people care no more when he can no longer serve them? At Red Acre Farm all the horses are treated in a way that is a lesson to every one who would like to be fair to animals. When horses are loaned it is only upon condition that they receive the same kind of treatment, and they must be taken regularly for inspection. G.

THE CHILDREN'S HOUR

The Little Mothers

LITTLE Edith and May were dressing their dolls. Such careful little mothers they were; for they knew they were examples for Dolly and Belle, who did everything their mothers did.

"Belle's back is quite limp," said May, regretfully. "We have not been drilling since Nurse left."

Edith replied quietly, "It is hard to do things by yourself," and she sighed.

"Nurse used to do a lot of remembering for us," May said slowly. "Don't you think if we really loved her we should try to do it for ourselves now, else all the trouble she took with us will be wasted?"

Edith thought so too. "It is lazy not to, isn't it?" she added.

May continued: "I remember Nurse said wrong things were selfish, and she said it was a fearful thing to be selfish, that night Cousin George drank all the milk at supper though he knew pussy would have none for his tea."

"We wouldn't do that," cried Edith.

"Nurse said that when you opened your doors to one naughty deed, you never knew what would come next. It is just as if there were a lot of ugly creeping things outside the door pushing to get in; they come in as thoughts and go out as deeds, she said, but good thoughts open the inside door and the bright fairies come and make us happy — don't they Dolly?" and she sang:

All the little children shining sunbeams hold;
In their hearts they're hidden, blossoms to unfold.
Joyous little sunbeams, making hearts so gay,
Chasing back the shadows, coming every day.

"Let us let some good thoughts in and do good deeds," cried little Edith.

"One, two, one, two," "Birds fly, fishes swim," and they briskly went through their drill; for it would never do to risk Dolly and Belle growing up selfish, when it made other people so unhappy. ETHNE

In the olden days Eastern peoples used elephants in their armies just as we use horses, and these huge beasts trumpeting and stampeding through the enemy's ranks have put many an army to flight. When Alexander the Great conquered King Porus, in India, he captured a valiant old war-elephant from the conquered army, named him Ajax, and dedicated him to the sun. He gave him his freedom after placing upon him this inscription: "Alexander, Son of Zeus, dedicates Ajax to the Sun." Three hundred and fifty years afterward the elephant was recaptured in the jungle with the inscription still upon him. L.

THE MANUFACTORY OF "POLKAGRIS," GRENNÄ, SWEDEN

Grenna and the "Polkagris" Factory

"POLKAGRIS" is something that all Swedish children like. It is a long stick of red and white candy just like the ones the children in the picture hold. The most interesting thing about it is that it is made in Grenna, a beautiful little town on the shores of Lake Vettern, just opposite Vising-sö. But do not imagine that it is made by machines in an ordinary factory. Every stick is made by hand in the little old house you see in the picture.

Grenna is an old fashioned place at the foot of a high, steep mountain on the top of which are the ruins of Brahehus, one of the castles of Earl Per Brahe. All the country round about is like a garden. In June, when the fruit trees are loaded with pink and white bloom, and the grass is so soft and green, it is a beautiful sight. No railroad has found its way there yet, so that you have to go there by steamer or coach. Life is very quiet and peaceful in this little old town beside the lake.

Grenna is famous for something else besides "Polkagris." Have you ever heard of the delicious Grenna pears? The town, like the island of Vising-sö, belonged to the great Per Brahe, who founded the school on the island in the seventeenth century. And soon another great school will be there. G.

THE CHILD SPEAKS

OH, years ago, I used to see
A fairy in our apple tree;
A tiny man all green and gold,
With wrinkled face, and eyes so bold!

He used to drop an apple red,
Hard as a bullet, on my head;
I'm sure he must have laughed, although
I couldn't hear him there below.

And there were other fairies, too,
Who made my nice dreams all come true,
And once I saw a fairy boat
Sail where the water-lilies float.

But when I learnt to read, oh then
Away flew all the little men.
I think they really must have known
How dull the fairy books had grown!

Why don't the clever folks who write,
Sitting and toiling half the night,
Just try to make the fairies come
Back to the earth that was their home?

All these dull books I'd give to see
That fairy in our apple tree,
To watch the pretty fairy boat
Sail where the water-lilies float.

C. K. B. (Selected)

Polly to the Rescue

IN the big Sicilian earthquake, hundreds of people were buried alive beneath the ruins of Messina, and many of them perished for lack of help after suffering hunger and thirst in their prison. But such as could be found the soldiers and relief parties dug out, often unconscious, after a long burial under the fallen masonry of the houses. No less than eight days one family was buried and yet they were brought out alive.

Some soldiers heard a parrot chattering beneath a pile of ruins and they thought that where the bird was there might also be human beings. After six hours they dug out a dog, alive, and after three more hours, nine in all, they came upon a family of eight people, also alive, but unconscious from hunger and thirst and cold. Some furniture had fallen like a roof over their heads and had protected them from the other falling ruins.

Saved after eight days! You may be sure they did not forget the parrot that had warned the soldiers. And if gratitude can make a bird happy, there is one parrot in Italy that should be the happiest bird alive. Polly spoke at the right moment that time. P.

THE SECRET DOCTRINE

The Problem of Suicide

AMONG the many terrible problems showing the unrest of the age and our ignorance of the *true* laws of life, is suicide. Its import does not lie in the mere destruction of life, which is trifling in comparison with that wrought by natural causes; but in the awful condition of mental stress which it indicates. For the suicides represent but a small proportion of those who suffer intensely without going over the verge.

To take a case, recently reported. A well known club woman, magazine writer, and sociologist, famed for her efforts to induce the legislature of her state to devise means for teaching women to keep house scientifically and to rear children in a healthy way, diligent in her home life as in her public affairs, commits suicide — her mind having broken down, as is believed, under the strain of too many activities.

How well her own case emphasizes her teachings about the children! It is safe to infer that she was not brought up as she would have liked to have others brought up, otherwise she could never have so lost her balance.

Well-nigh
Universal
Unbalance

But it is not so much the poor and insanitary homes that are at fault in the present case; the evil under consideration also haunts the luxurious mansions of the well-to-do. The children are brought up in a perpetual whirl of excitement; they are never allowed to rest; pleasure succeeds pleasure and task succeeds task; always some emotion is being appealed to and being exercised. Thus they grow up with the nervous system and the active functions abnormally developed, sensitive and excitable; and the central quiescent life undeveloped. So we get grown-up men and women who cannot stay still, but must always be doing something; only thus can they get the "sense of life"; if they stop, an awful blank ensues — for them.

And another terrible circumstance is that the despair and turmoil are so secret. These suicides are always unexpected. No one, even among the most intimate friends and closest relations, knew of the existence of such a state. How little, then, even the best friendship counts for, since it is powerless to stand by our side and console us in our most vivid and ever-present life.

There are thus two problems to be considered: How to get the inner peace; and how to get the power of discernment to help others in their real need.

To every man and woman there must come a time when the ordinary consolations all fail. A sudden sense of the unreality of all things has come over him, and all the teachings of both religion and science, and his own customary resources, seem equally unreal. Then is the moment when the true inner Life, the life of the Soul, might reveal itself; and there are some who win through this crisis, and, like Carlyle, take up their stand triumphant upon the rock of their own impregnable Divinity, defying the sham in all things, in all things discerning and worshiping the basic truth. But others, alas! fail; they flee from the blankness, and plunge back into the whirl of the senses and brain, or perchance take to drugs or to those dreadful mental narcotics classed under the generic name of "New Thought"; and sometimes they make the mad attempt to end their sensations by destroying the body. It may be that the majority of people do not reach such a crisis in this present life, but a great many do, and their case constitutes a fund of secret agony that is ever on the increase.

The people have not been brought up so as to be ready to meet this crisis when it comes. Christianity has not taught them anything that will apply to their case; it may suffice them for ordinary needs, but in these deep waters the pilot deserts them. The parents and teachers have never accompanied the child and youth into these recesses. There is no accidental philosophy or science that can touch the fringe of the question. And so, when the hour comes, the man is left face to face with himself, fain to summon whatever help he can arouse from his own interior nature.

If he had been taught from childhood up that this inner nature is a *reality*, had been accustomed to resort to it as a fount of strength and guidance, such resort would be easy in every crisis. He would have learned to cultivate a spot whose serenity no storms could ever ruffle; and however much his outer circumstances might be ruffled, even if body and mind were disorganized, this Soul-Life would be there to fall back upon.

Both action and inaction may find room in thee; thy body agitated, thy mind tranquil, thy Soul as limpid as a mountain lake.—*Voice of the Silence*

Theosophy is able to afford man this strength. Its teachings are in accord with reason, and do not mock the intelligence. Instead of beliefs which lose their reality under stress, because they are not in harmony with the facts of life, it gives truths that help

us and explain the facts of life. Under Theosophical teachings men learn to regard the Soul as a reality, whose power can be summoned to help and direct. They learn to use

**Life Comes
to Have a
Meaning**

all their faculties in due restraint and under balanced control, so as never to be carried away from their center. They gain true stability.

Body, mind, and emotions may be all harmoniously developed; the Spiritual Will becomes a controlling factor in every relation of life. Many grown-up people have been carried safely through terrible crises in their lives to a place of rest where they feel that they have a permanent strength and knowledge.

Again, Theosophy can endow man with that true compassion which brings with it discernment—the power to help. Mere emotional sympathy does not bring the power to aid in crises; it does not bring the power to discern the inward needs. Had the suicide been blessed with a true friend having the power of discernment, he would not have been left thus alone in his affliction. Even the best friendship often wears an aspect of callousness when judged by its results. Ignorance that allows a friend to commit suicide is too much like the ignorance that allows a child to fall into the fire.

Modern culture separates knowledge from religion, to the detriment of both. We seldom hear of saintliness and piety as conferring wisdom and the power to lead and instruct. We

**Wisdom, Joy
and Action
Indissoluble**

have a noble traditional type thereof, but instead of imitating him we prefer to keep him in the clouds as an unapproachable ideal. Theosophy is the gospel of *Self-Knowledge*, which is equivalent to the knowledge of Man and the knowledge of Nature. Under Theosophy we should not be such strangers to each other, each shut up in his own narrow self, forlorn and alone.

External conditions in our civilization are bad and excite horror; but they are slight in comparison with the terrible internal stress among all classes—perhaps worst among those who have less outer stress. Suicide is only an indication of it. Great is the need of wise and helpful teachings, such as those of Theosophy, to replace the gloom in which our lack of true religion and of true science has left us.

TRAVERS

A New Version of the Bible

THE Jewish Publication Society of America and the Central Conference of American Rabbis are preparing a new translation of the Bible. They aim at preserving the form which these Scriptures have received in the English tongue through the Authorized Version and the Revised Version of 1884, but to adhere firmly to the form in which the Synagogue has handed down what it regards as the original text. It is rather a revision than a new translation. The older English version, it is maintained, has become an English classic, part and parcel of the great English literature; its phraseology has entered into the language and cannot be dissevered therefrom with impunity; hence the new rendering will not discard familiar phrases so long as these represent the original, but will insist on the correction of mistranslations and

the removal of incomprehensible expressions.

The above illustrates a limitation of the human mind: we venerate things because they are familiar. And, as has been remarked in connexion with orthographical changes, we bitterly resent any change, however reasonable, when it is first made; but subsequently we become as enamored of it as we were of the older form. Again, with singular inconsistency, we clamor for conservation of the old, yet refuse to go back beyond a certain point. Thus we adhere with fervent veneration to the King James version, yet will have nothing to say to the Tyndale or Wycliffe versions. Or we go back to the Church as it was in the days of Henry VIII, or as we imagine it to have been in the days of the Apostles, yet refuse to go back further. All this shows how necessary it is, in the search for truth, to eliminate from the mind all prejudices that may be unreasonable.

If we remove from our minds those insular prejudices of the kind which urge us to regard the ways of our fathers as superior to any other ways and to cherish forms of words which we heard frequently in our childhood, then we may be able to allow proper weight to the sanctions of antiquity and experience. Then we may be able to listen with due respect to teachings that have stood the test of ages and not despise them merely because they are not couched in English or Biblical language. The scriptures of other nations may be regarded with a more polite and tolerant eye; and the wise of various religions may unite in appreciating their several sacred books according to such value as these may have as practical guides.

STUDENT

A Fatigue Antitoxin

AN exchange makes hilarious fun—as it well may—out of the announcement of a fatigue antitoxin by which a medical discoverer hopes to be able to abolish all laziness by inoculation. This doctor has found that muscular exertion generates poisons in the body; he has isolated the poison; and he has invented an antitoxin by the injection of which laziness can be removed. As the irreverent critic remarks, in future there will have to be laws to prevent men from working an extra shift under an alias, and all the books and mottoes on industry will have to be burnt. Mental fatigue also is expected to be amenable to the same treatment.

It seems pretty evident that this would result merely in a rapid running down of the nervous forces, ending in paralysis or death if not mercifully stopped by a milder malady. In fact the same thing happens now in cases where the sense of fatigue is ignored or deadened by excitement or drugging. What the doctor proposes amounts to a continual stimulation, which few people would concede to be good for the human organism. We cannot lay down an absolute rule as to the extent to which art may be called in to assist the natural functions of the organism; but in general it is accepted that means which are useful in rare special circumstances become injurious when made the rule. Normally the body is cleansed by ventilation, external and internal ablution, and rest; but such an exaggeration of the process as the one proposed would be as injurious as a constant resort to cathartics or enemata for a like purpose.

There is a notable lack of the sense of proportion in proposals of this kind, as well as a tendency to exalt the physical body to a position of undue importance as a determining cause in human conduct. The mind can create and destroy poisons in the tissues; and, if the body should be so fixed up by chemistry as to run without rest, the mind would need rest and change, or madness would likely ensue.

STUDENT

An Ancient Egyptian Ghost

WHAT follows below is unmitigated superstition—unless you happen to call truth a mitigation. A little of the mitigation the reader can administer for himself, if he happens to live in London. The rest he can accept, if he likes, on the authority of the late Mr. Fletcher Robinson, who made personal investigation into the facts narrated below, and narrated also in a recent lecture in London by Mrs. St. Hill. Mr. Robinson's comment was that the Egyptians had powers which we in the twentieth century disbelieve in. In other words, some of them were magicians, and not all of these were *white* ones.

In a corner of the first Egyptian room at the British Museum is the wooden cover of a mummy case, presenting the mask of a woman whose mummy *was* in the case. But when found, brought to the notice of a party of travelers in Thebes by an Arab some thirty-five years ago, the case was empty.

The mask was photographed, and the photograph is alongside. *But the photograph is far more the picture of a living woman than is its original.* The photographer himself discovered this first, and reported it in great excitement to the owner. Soon after, he died.

In so doing he only followed precedent; and here is the specialty of that mummy case, investigated by two professors and the aforesaid Mr. Fletcher Robinson.

Of the original finding party, five in number, one lost his arm by a gun discharge. The second died in poverty in a few months. The third was shot. The fourth also lost most of his fortune and died. The fifth brought the case to England and gave it to his sister.

Financial losses at once began in her family. It was she who, for that reason possibly, sent the case, or cover, to the Museum—and the carrier died, while his assistant broke his arm. Two of the attendants in the room where it is kept have also died.

We should suppose the original of the mask to have lived a very evil life, to have possessed powers called magical and habitually used them evilly, to be still in disembodied existence, and to be in magnetic rapport with the case that once contained the body.

In which theory we have consciously strayed into deplorable superstition. But it may not seem so outrageous in twenty years. Even now, ghosts—though these are not living entities save in very exceptional cases—are permitted to exist and to have existed during the few decades when their existence was most discredited. Discredited in words at any rate.

May there not reside within the invisible spaces of the ether a universe more complex than the visible, and filled with various orders of conscious beings—some, so to say, *super-*, and some *sub-* human, elemental? STUDENT

Some Views on XXth Century Problems

Jekyll and Hyde and . . .

STEPHENSON'S story is incomplete, but how many of its readers ever thought of its unwritten counterpart? Hyde, the demon pole of human nature, invited again and again, at last ceased to wait for his invitation and swept in once and for all.

But if "Jekyll's" left hand is "Hyde," has he no right hand? Is half-formed human nature, "Jekyll" — for it is still but half formed — left to deal unaided, as best it can, with the sleeplessly passionate energies of matter?

What happens when in some great emergency the common man suddenly becomes a hero, utterly self-forgetful in the danger of others? What happens when the breath of inspiration suddenly comes upon the poet or musician and makes them forget everything but the harmonies born in that hour within them? What is conscience, that prompting which if followed unswervingly would lead in no long time to a life perfect in act and thought and ever deepening in wisdom?

Hyde was as much of the ever present material passionate energy as Jekyll had in times past, in that and other lives, let into himself, with which he had consented as it were to share his selfhood, which he had stamped with his selfhood. Is *spiritual* energy or ideation less constantly present about us than the other? The counterpart of Hyde, then, is as much of the ever present *divine* as we have in this and other lives, let in, with which we have shared our selfhood. In that sense both god and demon are our own creations; yet one gives us life and the other death. Both are ever at hand. One, man calls forth from spirit; the other, from matter. Thence on, they are the ever contending Angel and Demon in his life.

In the *Avesta*, the soul just released from the body, passes forward toward the world of light. On the way "there comes to meet him *his own law* in the figure of a beautiful maiden." The soul asks her who she is.

Then replies to him his own law: "I am, O youth, thy good thoughts, words, and works, thy good law, thine own law [or course] of thine own bodily life."

Zoroastrianism called these divine others of men *Fravarshis*, divine prototypal ideations of men as men will be when perfected, drawn gradually into action by the aspirations and spiritual efforts of their earthly representatives. They are unconquerable by the "Hydes" of matter, but they may be *deserted* by men, who, in times past calling them forth from latency and thus becoming their co-creators with the divine, fail to maintain the connexion.

STUDENT

Inebriate Homes

TO the fine artistic and intellectual natures, narcotics — especially morphine — sometimes offer peculiar temptation. For in temporarily lulling the animal energies, such drugs give the mind freedom to enter its peculiar creative and intellectual world. The reaction is never considered; nor the fact that as time goes on more and more

of the drug must be used for a less and less result; nor the black clouds that at last roll in to be dissipated no more.

How are such victims to be helped? What sort of Homes shall we offer them for their cure by voluntary self-detention?

There are none yet which answer to the Theosophical ideal, for there are none yet which are closely enough related to the whole of human nature.

The desire of these people for that perfect freedom of mind in which alone they can do their best creative and intellectual work, is eminently legitimate. And if this freedom cannot be obtained without drugs which divorce the soul, evolution is a failure when it reaches man.

The basis of this freedom is perfect bodily health. But this requires something more than a perfect physical and physiological régime. The régime of the Home must correspond with the whole nature, a triple of body, mind, and soul.

Now the artist, the musician, who seeks certain free and creative states of consciousness, may, intellectually, disbelieve in the soul. Nevertheless it is from the soul that radiates into the mind that light which raises the mind to the states which alone it recognizes as its true life. And from the same states — unless produced by drugs — the body finally gets that added thrill of vitality which is necessary to crown the purely physical results.

The Homes to be founded within the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY by Katherine Tingley, will teach and demonstrate this to the victims who come for aid; will show them the dependence of perfect physical upon spiritual health; will show them that when that is attained, the states in which they can do their highest mental work will come as easily and normally as breathing — and will then as far transcend those produced by drugs as normal breathing transcends artificial respiration. The temptation to the use of drugs will then be rather passed on one side and forgotten than fought, left to wither of uninterested neglect.

STUDENT

The Core of Philosophy

WHAT must be the state of mind of the university student who has just finished a course in the history of philosophy?

Can he have any opinions of his own? He has heard every possible opinion on every philosophical matter; the systems which he has just studied box the compass of opinion. From antiquity to today he has found the universe to consist of fire, air, water, atoms, the Unknowable, God, thought, extension — or whatever else the particular system in hand proclaimed as the ultimate basis of things. And the ultimate processes are just as various. Which system shall he choose? Dare he choose any one of them?

What is that which philosophy would fain explain? Is it not, at bottom, the relation of the subjective to the objective; and, still closer, the manner of passage of the subjective to the objective? It is in *thinking* that

out that the writers get so near to, and yet so often miss by such a distance, the truth.

For they leave *themselves* out. "Man know thyself," is the whole of philosophy. That passage takes place every moment in man, and so it is in himself that he may learn how it goes. It is in him that motion, light, goes to and fro from subjective to objective, from *self-light* to mental light and light of perception. In him the circle of being completes itself; the serpent swallows its tail. The external world is light or motion become objective and formal; self is motion subjective. Even science now makes the (to it) ultimate units of matter centers of electric or luminous motion. At every mental breath man takes in some of the world and throws it out other than as it entered. The hope of human life depends on that. For the collectivity of self-consciousnesses in the universe make the universe and it will be as their ideal. It is the greater ones that sustain it and maintain evolution for those below. Thus and there, ethics and philosophy join, for compassion betters the universe and re-fashions it according to ideals. The ideal-makers are creators. Imagination, energized by compassion, is the secret of the gods — and the Logos; and the true philosopher must make it his secret if he would really know something that will lead to the practical use of power. What is the use of philosophy if it does not give power and the right use of it? STUDENT

"Substitute" Poisons

IF the way of the transgressor is often very properly hard, that of the well-doer is occasionally very improperly easy. The easiest way to give up alcohol without feeling the slightest discomfort from doing so is to keep on taking it under another name! There are certain temperance societies, it seems, which furnish their new reclamations — if desired — with the formula of a "substitute." This, which usually consists of the tinctures of ginger, capsicum and other stomachics, an aromatic oil or essence, and ammonia, may be from two to three times as strong in alcohol as is good brandy. An ounce a day, seven ounces a week, quite a common dose, makes a very decent "medicinal substitute" for a pint of brandy a week!

Whatever is legitimate stomachic in the combination, may of course be had without the alcohol. Five grains each of powdered capsicum, ginger, and *hydrastis canadensis* root, taken with a little alkaline effervescent mineral water or effervescent phosphate of soda, will do all that is properly done by the "substitute" and something more, making its own use soon unnecessary. The drug stores that will tell the tale of the popularity of the "substitutes," will also tell another of the almost inseparable acetanilid "headache powders."

Very much of the discomfort that follows the attempt to give up alcohol is due to the effects of the candies and sweets for which a substitute taste is so likely to supervene. But it only needs — though it does *need* — a very short period of resistance.

Archaeology Palaeontology Ethnology

Extinct Civilizations in South America

THEOSOPHISTS writing on the antiquity of Man have constantly to resist the suggestion, emanating sometimes even from students of Theosophy, that they treat with too much disrespect the researches and conclusions of some anthropologists who are investigating the skulls and implements of low-grade types of fossil humanity. It may be as well, therefore, to reiterate the grounds of such disrespect. These grounds are, not that there is anything objectionable in studying such remains, but that, in making theories about humanity's past, the theorists ignore certain other facts whose importance is so overwhelming that it would utterly discredit their theories if taken into account. In short it is a waste of time to be theorizing on the basis of a few comparatively trivial facts while ignoring far weightier facts. An illustration of this is the following:

A writer in *Van Norden's Magazine* points out that between the Aztec and Inca regions there lies a territory 1000 miles long and 800 wide, from the northern boundaries of Peru to the southern limits of Costa Rica. In one section alone, along the coast of Ecuador, *six entirely unknown civilizations* were brought to light by Professor Marshall H. Saville, and a vast collection of relics has been brought to New York.

Now however much people may differ from Theosophists, they should at least be willing to excuse them for believing that such facts as the above are of some weight in connexion with the question of Man's past history; and they should be ready to concede that some minds may be more deeply interested in the matter of ancient civilizations than in that of ancient degenerated humans or anthropoid apes.

This collection of relics, continues the account, is to be the nucleus of a great American museum representing the history of ancient peoples who attained an *extraordinarily high degree of civilization*, yet whose existence has hitherto been lost in antiquity.

Hurrah! says Theosophy; let the Americans study their own past history, instead of damaging their reputation for independence by slavishly following traditions based on various successive strata of European speculation. Why not show our independence by striking out new lines in scientific and historical research and by exploring our own past civilizations? Surely these mighty empires are of more interest and value than the unburied bones of poor wanderers? Surely it is more important to trace the analogy between contemporary Man and his illustrious predecessors than between his skull and that of certain animals which (for some reason or

Lomaland Photo. and Engraving Dept.

EARLY MEDIEVAL PILASTER, WITH CRESCENT

other) most nearly resemble him in externals.

The famed marble chairs of Rome at its zenith were not more symmetrical or beautifully carved than those of one of these unknown civilizations. No pottery of any other ancient race was more delicately patterned than that found in vast quantities, as numerous almost as pebbles, on the sites where these extinct peoples dwelt. Their cloth was of truly marvelous weave; in beauty of design, richness of color and fineness of texture no fabric today surpasses it.

Does this indicate an upward trend from barbarism? one may well ask. And where does the Red Man come in? Is he not a descendant of some or many of these ancient peoples? For there were many; *Professor Saville has not been able to explore more than one section, which embraces only two provinces in one country — the provinces of Manabi and Esmeraldus in Ecuador. And even here the remains are so thick that more surveys will be necessary.* Not a grave is opened but contains heaps of jewelry.

From Manabi come the majestic stone seats; they are found in an almost incredible abundance on the summits of the hills not far from the sea within an area of about 20 miles diameter. Some are of sandstone, most of andesite. Some have human figures, some animal figures, for supports. Great human figures and ponderous columns of stone have been found. How were these quarried?

The heavy rains and inundations have dis-

turbed many ancient burial grounds and brought to light mortuary vessels in which are skeletons with the teeth decorated with delicate disks of gold. They were prolific weavers, for many thousands of clay spindle whorls were found; and their workmanship in gold, silver, platinum, and copper, and pottery *rivals in many respects anything the moderns can produce.* Three thousand ornaments, showing a high degree of artistic culture, have been brought to New York. The symmetry of the vases borders upon the marvelous.

Nearer the mountains in Manabi other extinct civilizations have been discovered, but they bear no relation to this one, and *do not resemble each other.* Clearly America has a past history of civilization as complex as that of Europe and Asia; one day we shall unravel it.

And in Europe, as we learn from recent accounts, anthropologists are sitting over the skeleton of a degenerate man found at Chapelle-aux-Saints and trying to decide whether he was a man or a monkey; which might be a harmless amusement, did it not have a direct bearing upon the theories of our own ancestry which we are supposed to swallow. What on earth does it matter if they do dig up a few such skeletons? Are there not human degenerates on earth today? In our civ-

ilization we find them; among savage races we may find whole tribes of them; they approximate to the shapes of animals whose habits they imitate. What has this to do with human evolution?

Now that such totally unexpected discoveries have been made, and that they bear out the Theosophical teachings while confuting the theories of anthropologists, the natural conclusion is that further unexpected discoveries will be made, which will still further confirm the Theosophical teachings. The ancient civilization of the Atlanteans had reached a greater height than any now on the earth. Its offshoots peopled the continents of both Old World and New. And *this* is the explanation of the nations of mighty builders whose records we find on both sides. STUDENT

The Christian Crescent

THE Crescent was a primitive Christian symbol, Mary being sometimes represented standing on it. The reason is that the Crescent or Moon symbolizes the Eternal Mother, the source of all Nature, both interior and exterior. The Christians adopted the symbol. But later on they dropped it, retaining only the Cross-without-a-Circle; and the Mohammedans adopted the Crescent and Star. To be complete, all three symbols should be taken together, using the Sun (of which the Star is a variant). T.

✻ The Trend of Twentieth Century Science ✻

Poisoned Infants

THE (British) National Conference on Infantile Mortality has noted that while during the last thirty years the deaths in Glasgow have been halved notwithstanding the doubling of the population, the infants die as fast as before. It also notes that out of fifteen of them which die, fourteen die poisoned. At any rate the fourteen are artificially fed and the one naturally. Artificial feeding need not mean poisoning, but it is evidently exceedingly likely to do so. Even if cow's milk is used, properly diluted and properly reinforced with cream and milk sugar (*not* cane sugar), both it and the cream may be loaded with bacteria. And if the bacteria are killed by boiling, then something else in the milk, needed by the child, is also killed, altered, or dissipated. If cow's milk is not used, then the imitation of human milk is still remoter, and the likelihood of starch—which the infant cannot digest—still greater. Four years ago the Conference analysed thirteen expensive and widely advertised infant foods. Four of them were *three quarters starch*; three, more than half. Seven had less than one per cent of fat. Now milk contains no starch whatever; it has much fat in the form of cream; its nitrogenous matter is *not* the gluten of wheat, but casein, that which when coagulated by boiling or otherwise, is cheese; its sugar is of a special kind. An infant that is not to be poisoned must therefore—except for special medical reasons—have its fat, nitrogen, and sugar in these forms; and the bacteria should not have several hours previous unobstructed enjoyment of its food. Nor should our present antiseptics, or boiling, be the weapons against them. A harmless antiseptic is evidently the great desideratum, especially for town dwellers.

It may be found in some exposure to ultra-violet light, perhaps in exposure to radium, perhaps in pure nitrogen—the last, however, ranking as *aseptic*, not *antiseptic*. The usual preservative addendum to the *evaporated* milks is cane sugar, to infants a poison; and the evaporation is usually by boiling instead of *in vacuo*. M. D.

Scaleless Music

THE last volume of the *Journal of American Ethnology and Archaeology* contains a study of Hopi music by Mr. Benjamin Gilman, secretary of the Boston Museum of Fine Arts. Like the study of Zuni music which he made many years ago, this is based upon phonographic records; and the two musics appear to be alike in that they seem at first to possess no definite scale.

At any rate our scale lines are nearly useless for its transcription. Our interval of a tone is not divided in this music into two mere semitones but into *seven* small intervals for which we have of course no name. This enables the Hopi singer to do two things which we cannot. By using his shadings of tone he can make his melody fit his feeling very closely; and he can keep on repeating his melody in its main color whilst shading its rendering differently every time. The music is therefore

melodic only; harmonies would be impossible while this freedom was claimed. One can easily imagine that after one's ear had got used to it, our own more coarsely scaled and immovable melodies might sound very hard and inflexible.

There is of course no scientific reason why scales should not have any number of intervals. When a stretched string is struck it yields a fundamental tone, then a series of harmonics. The first of these is the octave of the fundamental tone, then comes the fifth of that; then the double octave of the fundamental; then the third, fifth, and minor seventh of that; and so on upward. Translating the first few of these downward into one octave we get our theoretical scale. Beyond these few, the harmonics when translated down lie *between* the semitones of our scale. But there is no reason why they should not be made parts of a richer scale for the expression of finer shades of feeling.

The Greeks had in a general way the notes of our scale, though they sometimes used quarter tones. We could reproduce most of their scales by taking our own A minor scale without sharps, treating this as the fundamental scale, and making six others by beginning on each of its other six notes, always without using sharps.

Another kind of music—it is surely entitled to be called that—is monotoned, the monotone being variously colored by altering the vowel through which it is sung. The various vowels have each their own sets of overtones. And there are of course many more vowels than are used in the English language.

According to our musical sensibilities and to the view we take of the Zuni and Hopi Indians, we can now regard their music as a relic of the vanished and forgotten American civilization, or as a barbaric affair from which our own scant scale has evolved. STUDENT

Electricity from the Sun

A BOSTON inventor is obtaining electricity enough to light his own premises by transforming the heat of the sun. The invention depends on a simple principle whose application we have suggested once or twice in the columns of the CENTURY PATH.

When bars of dissimilar metals are joined at one end and the junction-place warmed or heated, a current of electricity is generated which can be collected from the other ends of the bars. Its amount depends upon the electrical dissimilarity of the metals and upon the amount of the heating. If the junction place is exposed to the sun and the rest of the bars' length kept cool, the current is taken without cost direct from the solar heat. A sufficient number of such metallic pairs will yield any required quantity of current, and this can be stored.

The specialty of the invention is that an automatic cut-out comes into action when the sun happens to become overclouded and when it sinks at night, so that the storage batteries cannot reverse and discharge themselves. Nearly a thousand pairs of metals are used.

Once these are installed the cost is of course little or nothing.

There can be no question that the days of burning mountains of coal and wood for our energy are within sight of their close, though the sight may be a long one; perhaps even the days of obtaining power from falling water may be also nearly ended before they have well begun. We can certainly do more with the sun than see with him; and when we can tap the earth's magnetic and electric currents we can do more with her than walk on her. All the practical problems of this kind will be easily soluble as soon as the amount of intellectual energy now wasted on the preparation of armaments and explosives is turned into respectable channels. STUDENT

Musical Stones

A STUDY of the musical bridge of Bellacorick in Ireland might give us some light upon the nature of "singing stones"—stones upon which legendary musicians of old worked such musical marvels.

The bridge in question spans the river Oweniny and the music or the tones are yielded by the stones of the parapet coping. These may be struck individually by a stone held in the hand, or the stone may be sent skimming along a length of the parapet. As it skims it strikes out a succession of rich full tones.

Mr. Sherlock in *The Irish Independent* says:

Each coping-stone gives forth its own note when struck, and as there are dozens of these stones on each side of the bridge, the number of possible notes which may be obtained, if we regard the bridge as a big musical instrument, is considerable. All the notes are truly musical in quality. Many of them bear fixed relations to one another, which would enable them to be classified in such a manner as to constitute an ordinary scale.

Why these stones ring is totally unknown. Perhaps a little of the ancient soul of Ireland is in them. They are of a hard limestone; but so are other stones with no musical pretensions. Their bedding and setting is pretty much like that of coping stones on a hundred other bridges. So there is a chance for some scientific work. STUDENT

The Third Eye

A NATURALIST who has been studying the sporadically appearing shield-shrimp of Great Britain, suggests that one of its three eyes—and indeed of all other creatures that have or had three eyes—may be for the perception of kinds of light or radiation imperceptible to the other two. This particular creature has two ordinary eyes of the multi-facet insect type, adequate for the seeing of everything. The third is the apex of the triangle, is very small and has one lens only. It can never have been evolved to do what the other two can do so very much better.

The human pineal gland, now packed into the middle of the brain between the hemispheres, is the remains of a third eye. According to Theosophy it functioned in primeval man and *was* for the reception of vibrations immeasurably beyond the reach of the other two—that kind of "light" which we regard as so named only by a metaphor. Thunderstorms and Electric Wires

LAST June a thunderstorm broke out in the Department of Vaucluse, in the south of France, and extended over a length of about 10 miles and a width of $1\frac{1}{4}$. It coincided with the path of an electric power line, carrying a tri-phase current at a tension of 45,000 volts. Though there was a mountain range about 3500 feet high running parallel at from two to three miles from the wire, commonly regarded as a cause of hailstorms, this thunderstorm followed all the sinuosities of the wire and produced its maximum effect in the vicinity thereof, the damage done decreasing in proportion to the distance from the wire. Three balls of fire were seen to hover over the wire and then burst with an explosion which was followed by a shower of hail. Evidently the storm was guided by the wire, but whether it was caused thereby is another question which has aroused much interest.

H.

Electroculture of Plants

AN article on this subject appears in the *Scientific American Supplement*, translated from *Prometheus*. It appears that the first experiments were made by a Professor of Helsingfors in 1885, and that until recently little has been done. But now fresh experiments have been carried out on a large scale in England, first on a plot of ten acres, and later on one of twenty-five. The installation consists of a system of wires strung from insulating supports over the field. This system is connected with the positive pole of a small dynamo giving three amperes at 220 volts, and the other pole is earthed. The motive power is supplied by a two horse power benzine motor. The alternating current from the generator is transformed up to 100,000 volts and is then rectified. Thus there is a very high tension, while the low ampereage precludes danger; and the wires may be placed at 17 feet from the ground,

Lomaland Photo. and Engraving Dept.

RÖTTLE BAY, NEAR GRENNÄ, SWEDEN

allowing ample room for work. A discharge occurs from the wires to the ground, often accompanied by a crackling sound, and at night by a glow.

In 1906 the field was sown partly with English wheat and partly with Canadian, and exposed to the action of electricity on 90 days, in all 622 hours, the current being switched off at night. It was found best to use the current during the morning in summer, and all day in spring and when the weather was dull. The chief effect was on young plants; the seedlings were more deeply colored and more vigorous than in the plants grown under ordinary conditions for comparison, and later on the stalk was 10 to 20 per cent longer than

in the ordinary. The increase in yield was 39 per cent in the case of the Canadian wheat, and 29 per cent in the case of the English the latter being perhaps more stolid than its Canadian cousin. Next year the experiments were extended, with like success, using also strawberries, tomatoes and raspberries.

In Italy an experimenter improved crops on poor unfertilized soil by burying at intervals zinc and copper plates connected by wires; iron and copper were also used, but found to give inferior results. The effects were similar to those in the English experiments, being most marked on the young plants, which were caused to germinate more quickly.

A method shown at Marseilles can hardly be classed as electrical, since the effects

were due to heat generated by burying resistance wires; and it is possible that heat might be generated more economically by other means.

The English experiments showed a surplus of gain over expenditure, not counting the cost of installation which it is thought might be rather high. The power plant could be used during other seasons for other work. In market gardening, especially fruit forcing, the area would not be so great and the profits would probably be higher. There seems something incongruous in employing high-tension currents to stimulate the slow quiet work of Nature; and bucolic felicity is not easily associated with power plants and tall poles. E.

Lomaland Photo. and Engraving Dept.

A NEW FOREST (ENGLAND) SNAKE-CATCHER

Preserving Niagara

THE United States and Canada have decided to limit the amount of water that may be taken from Niagara Falls for power purposes. The average discharge of the Falls is 250,000 cubic feet per second. The companies on the Canadian side have been limited to 36,000 feet per second, and those on the United States side to 20,000. So commercial interests have not got it all their own way with aesthetic interests yet. And we may still enjoy the possession of Niagara. E.

Students'

Path

BEGIN IT

LOSE this day loitering, 'twill be the same story
To-morrow, and the next more dilatory;
True indecision brings its own delays,
And days are lost, lamenting over days.
Are you in earnest? Seize the very minute;
What you can do, or think you can, begin it;
Boldness has genius, power, and magic in it.
Only begin it, and the mind grows heated;
Begin it, and the work will be completed.

Goethe

**'And a Man's Foes Shall Be They
of His Own Household'**

I FOUND lately, to my surprise, that one I thought my best friend, one who had lived in my house in the closest intimacy, was really my enemy, intent upon his own aggrandizement even at the cost of my undoing. We got on very well together for years, and he gained great influence over me, for I always found his advice exactly suited to my moods. He would give me excellent reasons for taking a little more wine than my other friends suspected; and the excitement of gambling at cards, at the ruinous expense of time and neglect of duty to my family, was encouraged by the suggestion that my winnings should be devoted to charity. Other, and less innocent gratifications were beginning to attract me without protest from him, but a sudden revelation of horror on the very brink of a yawning gulf of degradation awakened a sincere desire to retrace my steps, and I quickly changed my courses and withdrew from my fast associations. I even joined several organizations for the rescue of the fallen and the amelioration of social conditions. Having a facility for public speaking and plenty of energy I soon came to the front in committees, and finally I was chosen for public office. All this gave me great satisfaction and I flattered myself that I was a "chosen vessel."

Now you may think that I had surely included my intimate friend in my black list; but no, he was too comfortably ensconced in the best part of my home to be easily disposed of. No sooner had I reversed the direction of my activities than he came and warmly congratulated me on my resolve, and said he would now be able to give me the good advice which he had never before found me willing to hear! And so we remained excellent friends and I profited by his counsel to increase my personal influence. For a long time everything went just as I wished, though, to be sure, there were occasional mortifications when some ambitious colleague would try to force plans not in consonance with my ideas; but by a little wirepulling, a touch here and a touch there, under the advice of my friend at home, I kept things as I wanted them and enjoyed a satisfaction which seemed to me to be on the whole well-deserved.

Yet in spite of my conspicuous virtues my home seemed little happier than before. I spared neither expense nor trouble in having everything of the best; my children were irreproachable in manners; my hospitality was proverbial; and everything went with smoothness; yet there was something lacking. My wise old mother, who lived a very retired life in the upper part of the house, had several times hinted that the presence of my quondam friend was not desirable, but I became so highly indignant and alarmed at the idea of parting with him that she said no more, though she kept a watchful eye on all that went on. I learned afterwards that she felt that I must discover my own folly by experience, though she was ready to give me the benefit of her wisdom if I would only call for it.

A few things which happened in consequence of following the advice of my enemy, as I must now call him, began to open my eyes to the true state of affairs, and I deeply regretted that I had not taken my sensible old mother's counsel long ago.

When my enemy patted me on the back and said my changed life was giving a splendid example, he was just feeding my hunger for personal reward, and as the hard, but really merciful, blows which now rained upon me forced me to reconsider my whole life from an impersonal aspect, I found it one gigantic craving for adulation, or at least recognition, from everyone I contacted. Even my love for my children was not free from this, and my well-ordered household now seemed to me a whited sepulchre.

By putting my free will under the control of my enemy, and listening to the flatteries through which he kept his position in my house, the greatest acts of my philanthropic career now counted for nothing in my own sight; and in place of the pure love for helping humanity inspiring my exertions—an ideal which burns away personal egotism like chaff—I saw that it held the smallest place in my heart, and that I had blindly obeyed the prompting of my enemy because of the satisfaction of standing before the world, *and in my own sight*, as a person of importance.

In the midst of my troubles my first thought now was, how to get rid of my enemy, and soon I found my mother's advice indispensable. She told me to show him that I had found him out, and to ignore him until he was willing to come to terms. Then to treat him as a servant which was his original position. I was in serious earnest, and though he hated to lose his authority and fought hard to dominate me as hitherto, I succeeded at last. Since we have each found our rightful places a new and gracious atmosphere has filled our home, and my "enemy" is showing such excellent qualities in his new position that I can see we shall once more become good friends, though never again on the old false basis.

The Advance of Theosophy

IN describing the results of an early discovery which laid the foundation of modern research in one department of knowledge, a distinguished scientist writes as follows:

The turbid sense of groping and viewless ignorance gave place to the lucidity of a possible scheme. The persuasion of knowledge is a keen incentive to its increase. Few men care to investigate what they are obliged to admit themselves entirely ignor-

ant of; but once started on the road of knowledge, real or supposed, they are eager to pursue it.

Whilst this was written in a comparatively limited sense, it is capable of a very wide application. It shines with philosophic truth, and displays a deep knowledge of human nature.

No words could more accurately describe the proclamation of Theosophy by H. P. Blavatsky, and the advance which it has since made in the public estimation. Before its advent in 1875, the condition of western thought upon questions of human history and ethics had finally resolved itself into a "turbid sense of groping and viewless ignorance."

But the light which Mme. Blavatsky introduced upon these all important questions, through her teachings and writings, brought about in many advanced minds, the "persuasion of knowledge." She began to foster in the West, that which she describes in *The Key to Theosophy* as "a conviction . . . that there must be somewhere a philosophical and religious system which shall be scientific and not merely speculative."

This was written exactly 20 years ago, yet in this comparatively short time how many there are who are now "started on the road to knowledge" and "are eager to pursue it."

Theosophy has made an extraordinary advance during these 20 years. In spite of false professors of its sacred truths, and of enemies without who have a vested interest in human ignorance, it has become already the greatest revelation of modern times. STUDENT

Resurrection

TO rise again! What a promise in this word, for that is just what re-surrection means. To rise again! We have then, in the past, dwelt on the heights and grown in splendid sunlight. It is from that that our fairest memories come. We call them fancies now, and dreams; we think they are but vaporous air; yet they are faint, dim glimpses of the time that was and will be again.

For ages evil dreams caused by more evil counsel have nearly killed our faith in joy, our very love of joy. False men have taught that religion meant gloom and sorrow, and the bliss that was held out to us bore no relation to our actual life. Of the Christos men have made a martyr, a meek, poor man of sorrow, instead of the bright, glorious messenger of Hope that he is.

It is true that much that we miscall pleasure is but base; but it is not and never will be true that goodness brings sorrow, or that constant gloom is the companion of righteous living. Sorrow there is, and woe, but they are passing states, the outcome of past wrongs. We must pass through them; but beyond there lies the land of hope, of freedom. It is despair that chains us now, more than a love for the wrong; but it, like darkness, is impermanent and fleeting. It weighs us down awhile, but fortunately hope is buoyant in each human breast, and though darkened for a time, it will forever rise again, a symbol of the everlasting life. It points to joy unspeakable, to glories hardly dreamt of here before. It is a guiding star, and well we do to follow it. So let us look ahead, and up, and within, and we shall see the Christos, the one with kingly mien and radiant eye, who beckons us to follow, with the bright promise of rising to its glorious height of service to the race. E. T. S.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question Is the Life of Christ looked upon merely as the history of a good man, or is he regarded as a Divine Man?

Answer And it came to pass as he was alone praying, his disciples were with him: and he asked them, saying, Whom say the people that I am?

They answering said, John the Baptist; but some say, Elias; and others say, that one of the old prophets is risen again.

He said unto them, But whom say ye that I am? Peter answering said, The Christ of God.

And he straightly charged them, and commanded them to tell no man that thing.

The questioner here is evidently unaware that a Christ is a divine man, different from other men only in that the Christ, the Divinity within, is fully active, to use a loose term for a thought that is not very well provided for by the makers of the English language. *Christ* is an old term used among the ancient Greeks, with its equivalent among the Egyptians, the Hindûs, and possibly the ancient Americans, centuries before the "year of our Lord," to express the state of a man who had attained his divinity—had united himself with the divine potency within. There is a vast literature on the subject, and the inquirer would do well to read H. P. Blavatsky's *Studies in Occultism*, No. 5, for further information.

Reincarnation, without which such attainment of union with the divinity within (where the kingdom of God is declared to be, and the spirit of God) would be the hopeless task of a Sisyphus, was officially done away with at a council of the early church, after being taught, as far as such a universal teaching needed to be taught, for four or five hundred years. Even now it is believed in by the majority of the world's population who believe in anything. The above quotation will show that the idea was familiar to the disciples, and tacitly endorsed by the one known as Jesus. Unfortunately the church dogmas soon overlaid and crowded out his teachings, except where they were not inconvenient to the "Church and State" policy inaugurated with Constantine.

Jerome was permitted to go to Palestine and investigate the old records there; he reported that the church had so far departed from the original teachings that to revive them would destroy the church. This should be a hint that the gold in the narrative of Jesus is none too much, and that all dogmatic statements made by anyone about him are liable to turn out dross when the light of further knowledge comes. They should be made to stand or fall by their intrinsic worth alone.

The statement is made, "Be ye perfect, even as your Father in Heaven is perfect." This emphatically declares the possibility and the duty of attaining Christhood by all, and certainly not by proxy.

This doctrine of human perfectibility clashes with the theory that we are all "worms in thy sight," and there can be little doubt as to which will be chosen by such as are not groveling, cringing, cowardly natures.

The Westerner has almost invariably built up a more or less vague picture of Christ, as Voltaire says, "in his own image."

Ernest Rénan is largely responsible for the

sentimental, feminine, harmless, backboneless enthusiast, utterly unlike the fighting Christ of the scene with the money-changers in the temple, and the ascetic Bedouin of the desert, unkempt and probably unwashed, or the grand fearless figure declaring the world-old law that "as a man sows he shall also reap."

Others there are who today in Palestine, meeting a young village mechanic, a carpenter, would fear Mrs. Grundy far too much to be anything but patronizing towards him, even if he showed much intelligence; and if he actually went so far as to perform a miracle they would write about it to some cheap magazine explaining it as clever hypnotism.

Others, empire-makers, would say that such religious enthusiasts should keep their fingers away from sedition if they do not wish to get what they deserve.

As for the possibility of a man in London wearing a hard felt hat and a corduroy coat, with his hair cut short and a carpenter's tool basket, the idea is unthinkable. Yet the parallel is only one of latitude and longitude and a matter of centuries. If such a man with a pronounced Jewish accent and features were to preach in Trafalgar Square he might last about ten minutes, and he might not. Let none suppose any disrespect is meant by this, for it is not.

Among these and such other pictures, which is the "good-man" Christ? And is he one with Milton's extraordinary God, or the God of the half-tamed Hebrews of the desert?

Jesus' policy of silence, silence, silence, was justified time and again. Peter was one of a coterie of three who were shown deep mysteries under pledge. These again were part of the twelve who were taught things not taught to the "multitude." The seventy were probably still another body or degree including the committee of twelve, and receiving special teachings. And yet the pathos of the undercurrent that runs through all such teachings as are available! Peter, the trusted, is addressed as Satan to his face, and declared to be more of a worldly character than spiritual. And coward as he proved himself to be more than once, in the end he denied his Teacher, after the significant vehement protest almost the same day a few hours before—that he would be ready to die with him! No wonder that the known teachings of Jesus could be written on a single sheet of paper, and those that are actually carried out by his self-styled followers in half the space! He emphasized deeds, not words; he belonged to no church and broke away from the sect to which he owed his training; he finally unmasked the "goodness" of the world.

But he had not the seven years which is the minimum necessary to all such work, to train his disciples, and the desolation that has followed in the trail of the teachings attributed to him is the world's sorrow of two millenniums, because even the best of his later followers were not spiritual enough to keep the teachings pure, the link unbroken.

Yet even as a man of ordinary common-sense, let alone anything more, he must have known why he kept such strict silence, and would have arranged to leave the truth about himself somewhere in safe hands to be brought to light when the time and the people came, people who should so live the Christ-life as to do "greater things than these," as he says in

his emphatic discourses on work versus talk.

And for such as are worthy and free-minded and undaunted there can be no doubt that such records exist, as well as the records of his teachings, which were neither for the "multitude" nor even for his disciples, who "could not bear them now."

Can we bear them yet?

There are Christs today and they would be among us if we or our churches were worthy of being among; there are teachings today which none could keep from us were we worthy; the kingdom of God is within us today and we should not need to be told so if we were spiritual as little children; we are suffering today because of the harvest from our past seeds and deeds that we have to reap; there are good men today who are worthless to the world because of their selfish desire for self-salvation; there are bad men today who are more Christ-like because they are struggling onward to the light to ease the burden of the world; there are men in prisons today worth scores of the immoral preachers who are not. Who shall say what is a good man? Let him be a good man as far as he knows how, and if he is sincere he will need in course of time to ask no other than his own divine intuition, "Who is the Christ?"

Ecce homo!

STUDENT

Question Is Theosophy a pessimistic philosophy?

Answer Pessimism is the doctrine that this world is growing worse; it holds that the universe sprang from nothingness and is tending towards nothingness, which it will ultimately reach; that existence is an evil. Pessimism looks on the dark side of life, and exaggerates evils.

The worst conceivable world would be one that is continually growing worse. Theosophy does not look upon our earth as such a world, but as a stage in the evolution of a part of the universe, an evolution which tends ever to something higher and better, a cyclic evolution leading through periods of activity and rest toward perfection.

That cannot justly be called a pessimistic philosophy which teaches the ultimate perfection of the human race. Theosophy does not hold that the universe sprang from nothingness, or that it is tending toward nothingness; neither does it count existence an evil.

The experience which comes through our limitations, the temptations, the struggles, the failures, the triumphs, all have their part in the evolution of the individual soul.

Theosophy does not look on the dark side of life and exaggerate its evils, for it teaches the reign of justice. It teaches that each individual has his own destiny in his own hands, that his present is the result of his past, and that his future will be what he makes it; that he reaps what he sows. This is the law of Karma. No Theosophist has any right to complain of fate, Providence, or the law of heredity; for he has inherited according to his deserts, being drawn by a law of attraction to that parentage, that home, and those conditions, for which his past lives have fitted him. So instead of complaining, he has simply to sow the seed of good, and a harvest of good will follow; but as all humanity is linked together, he must help to lift the race, in order himself to attain his true position. B.

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

The Love of God

A BISHOP recently said, as reported:

I don't care whether there is a God or not, unless that God cares for me. What the world wants to know is not who sits above space and worlds and sends out planets—that's not what I want to know. I want to know that God can reach his hand out in this life and touch my heart. A child is sure of its parents' love. That confidence, that filial respect, is the very beginning of prayer.

And afterwards the child grows into a man, and then, if he be a true parent, he loves his child even if that love is not returned. There is consolation in being loved, as the bishop says; but the strong man or woman knows another resource; and that is to love. Moreover, the man who finds his happiness in loving is more independent than the man who finds it in being loved; for nobody can deprive him of his happiness, whereas the other is likely to find a good deal of gall with his honey. Perhaps God is rather tired of having us all looking to him for love; perhaps he would like to see us shedding some love on our own account. Fancy Jesus walking in our midst with a mob of people clinging to him like children; what would he be likely to say? One can imagine that he would have one of his moods of lofty indignation. The CENTURY PATH begs the bishop to open his Bible at the Gospel according to St. John, the 21st chapter, and the 15th verse, where he will find "God's holy word" written as follows:

Jesus saith to Simon Peter, Simon, son of Jonas, lovest thou me more than these? He saith unto him, Yea, Lord; thou knowest that I love thee. He saith unto him, Feed my lambs.

And the same dialog is repeated twice. If the bishop will then turn to chapter xv., verse 9, he will find the following injunction, which seems exactly to fit his case:

As the Father hath loved me, so have I loved you: continue ye in my love.

Surely this can only mean that Jesus wanted them to continue the act of bestowing; otherwise we must believe that the Father loves the Son, and the Son loves man, but man in his turn is to be beloved! In fact, in verse 12 he says:

This is my commandment, That ye love one another, as I have loved you.

In *Matthew*, v., he says that we must love enemies, for

MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

If ye love them which love, what reward have ye? Do not even the publicans the same?

And with what gentle modesty does the Master speak of his own mission:

That the world may know that I love the Father: and as the Father gave me commandment, even so I do (*John* xiv. 31).

Peace I leave with you, my peace I give unto you: not as the world giveth, give I unto you. (*Ibid.* 27)

How would it have rejoiced his heart to hear the disciples say, "Yea, Lord, and as thou hast loved us, so love we all men."

In fact the bishop does not seem to know his Bible very well; he could be convicted from the epistles of St. John alone; that evangelist has some things to say about love which the bishop must surely have temporarily forgotten. Perfect love casteth out fear and illuminates and ennobles the whole nature.

No doubt one will incur some reproaches for venturing to criticise the attitude of those who find comfort in thinking that God loves them. But all the same it must be said that such an attitude is not the best. If the Divine love were to send its ray into your heart, would it not kindle there the likeness of itself and send you out among men inspired with a love for them? Does love bestowed need no requital? Are we to be recipients only? Surely this is not a very lofty idea of love; chivalry can beat some forms of religion in that respect. Even the passionate love of a lover may transcend this weak sentiment and be content to love expecting no return. The love of a mother is far nobler than such love.

It is the firm belief of Theosophists that neither Jesus nor his disciples ever taught this weak form of love; but that it has crept into Christianity since. It has had an emasculating influence on humanity, and Theosophists would wish to rouse the world to a more worthy and manly ideal. Let them not rest satisfied in the comfortable reflection that God loves them; but let them get up out of their sluggishness and love someone else.

Let those who imagine that Theosophy

is opposed to Christianity take this to witness, that Theosophy, among other things, is striving to rehabilitate the travestied teachings of Jesus the Christ. Theosophy would have all men know of the eternal joy of loving—loving unselfishly, without looking for reward or return. To be filled with love for all, so that the act of radiating love

would more than fill all the spaces of our being, that is the ideal of attainment. And it is what Jesus taught. How he strove to make people see it! Once again, as in Galilee, there is a call to men to arouse themselves and recognize their own Divinity, prove by their acts that God's love is in them, and exchange the attitude of expectancy for one of strong action.

E.

Where Are We?

"WHERE am I?" is a question which may be answered satisfactorily within certain limits, but not so easily when those limits are extended. We may be in our own garden; yet that garden is traveling around the earth's circumference at perhaps 1000 feet a second, and around the earth's orbit at 18.6 miles per second. Again, the solar system is on the move. The Milky Way consists of solar systems, of which 140 millions have been counted on photographic films, and all are moving. It has been asserted recently that the universe consists of two parts moving in paths which make an angle of 115° with each other. Our sun forms part of one of these processions and is speeding somewhere. "What is our goal, when shall we reach it, and what will happen then?" says a writer in *L'Illustration* (translated in *Scientific American Supplement*). The words *When* and *Where* lose all meaning in such a connexion! But we are never twice in the same region of the celestial depths; and space, time and events move in ever-recurring and yet ever varying cycles.

STUDENT

"It Lives and Breathes"

MADAME Blavatsky in writing of the earth makes the remarkable statement that it lives and *breathes*, so that the Theosophist is only moderately stirred to wonderment at the announcement of M. Camille Flammarion, that there is a daily rise and fall of the crust of the earth amounting to about eight inches, analogous to the tides of the ocean and the daily barometer wave. L.

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

THE program at Isis Theater last Sunday evening included two addresses by Râja Yoga students on the subjects: "Some Differences in Ancient and Modern Civilizations," and "Economy and Waste from a Theosophical Standpoint." In the former of these the young speaker asked: What is it that most distinguishes our modern civilization and which entitles it to the designation of great? To which he replied, Money and guns. It is these that have made the great nations; the chief aim seems ever to be to get more money and more guns. And the national ideals? How can we measure them except by that which they set before themselves as their chief aim, namely to get more power than their neighbors, and to have more money and more guns than they. Is it right that the highest aim in life should be to act like the big fish which lives by swallowing the smaller? If this be the survival of the fittest, surely not a happy outlook for most of us. But if we look at ancient Egypt, Central America, and Peru, we find there civilizations that endured for thousands of years, and which excelled ours even in that of which we boast so much, material progress, engineering skill, and the arts and crafts. Look at the Pyramids, and the great monuments of Peru and Central America; what have we to compare with these, and the spiritual life of a people is breathed into their buildings and all their work. What have we to put into ours, and what message will they give to the peoples that shall come after us?—if indeed they last at all.

In discussing the problem of "Economy and Waste from a Theosophical Standpoint," the second speaker spoke of the twentieth century spirit as being essentially a practical one, men today seeking more and more to deal with facts and realities, and regarding with suspicion anything which cannot be put to direct proof. "System" and "Method," he said, are the two great keystones of modern material progress. He compared a young nation to a child which thinks that its parents' resources are inexhaustible. Is not our action in America like that of a child when we think of the waste of the natural resources of the country? The destruction of vast tracts of wooded land, and of other resources means a severe check to national prosperity even though we consider only the monetary side of the question. But let us look at it from another standpoint.

When we use the word economy with reference to the highest that is in us we have to give it a nobler and more royal interpretation. Spiritual economy means all that material economy means and a hundred times more. "Give up thy life, if thou would'st live," said one of the teachers of old. "Cast thy bread upon the waters, and thou shalt find it after many days." "He that saveth his life shall lose it, but he that loseth his life for my sake, the same shall save it." All these quotations tell us what is meant by the economy of our higher natures. And since Theosophy is the science of life, it does not leave us in suspense in regard to their meaning, but interprets them so that we can understand. . . . It is summed up in one word and that is Selflessness; unselfishness is the first step toward the goal of human effort. To practise real spiritual economy we have to begin in our daily lives and make each minute and each hour count for something good and beautiful for others. And casting aside the old garments of selfishness we shall stand forth as warriors in the Light of the New Day that will dawn for the whole human family.

OBSERVER

The Seven Principles of Man in Ancient Egypt

ONE of the most valuable services rendered by H. P. Blavatsky to humanity was the demonstration that the key to a true philosophy is to be found in the study of the principle of Emanation, of which the ancients have left us some more or less esoteric fragments in their philosophies, but which has been almost forgotten in modern Christianity—now, metaphysically, little more than a system of ethics—and which scientific thought has practically repudiated. Yet it is a fact in nature, a necessary portion of the

universal principle of Solidarity, and it comes home very closely to each thinking man when he asks himself "Why," and "Whither."

While Herbert Spencer and the modern school admit the necessity of an Unknown Source, or the "Homogeneous," behind all manifestation in separate forms, or the "Heterogeneous," the various stages of descent or emanation from the super-spiritual existence of the One Life down to the grossest appearance of atomic or molecular matter, have been ignored or repudiated as superstitious ideas of the middle ages. The primitive gaseous nebula is about the limit beyond which modern speculation does not venture, and yet even granting that a primitive "element" may be found, into which the seventy or eighty known forms of matter may be resolved, that will still be on this material, three-dimensional plane, and governed by the normal laws of physics. Finer states, controlled by unknown and ap-

ence. Even to the orthodox believer, the "Elohim," i.e., the Creative demi-gods of *Genesis* (of whom Jehovah was one), are synonymous with "God," the Unknown Sustainer of all, Which in reality stands behind and is only to be approached through Its manifestations.

But Theosophy stepped into the breach at the pivotal time, when there seemed to be no possibility of light upon this subject, and brought forward this neglected factor in modern thought in such a way that it could be comprehended by persons trained in our ways of thinking. And Theosophy did not bring this forward as a mere academic matter of discussion, but as a vital point in the life of man; for as the spiritual consciousness of the One Life descends nearer the material plane it loses the sense of Unity, until in the brain-mind and personality of man it has reached almost the limit of the sense of separateness

parently paradoxical laws, and perhaps interpenetrating the molecular, and yet not, properly speaking, spiritual in the lower degrees, are also rejected in spite of evidence. The logical necessity of the overshadowing presence of various grades of high Spiritual Beings, Guides and Creators, in each successive plane of descent from the formless, is as contemptuously repudiated by the self-styled scientific spirit of the age as the suggestion that the universe runs itself like clockwork—but *without an intelligent winder*—would have been by the profounder metaphysicians of antiquity, or is by the few more intuitive thinkers of today who have withstood the materialistic contagion. The theologian of today, to judge by the absence of any definite agreement or consensus of opinion within the churches, has, while not exactly denying the doctrine of spiritual governance through degrees from the Logos to the "Powers" and "Principalities," practically disregarded it, and anyway has no evidence to produce which can shake the attitude of sci-

or isolation. This is part of the necessary experience through which the Higher Self has to pass, but it should last as short a time as possible; for our evolutionary progress depends upon the breaking down of this illusory separateness which holds back the union of the spiritual with the intellectual—the full incarnation of the god within.

We reproduce two Egyptian interpretations in diagrammatic form of the creative forces in Nature and Man which will undoubtedly prove of interest to our readers. The first is an illustration from the sarcophagus of Seti I., (B.C. 1400 ?) and is roughly sketched from a beautiful colored plate in Dr. E. A. W. Budge's learned work *The Gods of the Egyptians*, in order to show the main features. It obviously represents the Plan of Creation, but much of the symbolism is obscure, especially to archaeologists who have not compared it with the correspondences in the Hindû, Greek, and Kabalistic Cosmogonies, and still more to those who have neglected the opportunity of

studying the clear explanations of many of the difficulties, given by H. P. Blavatsky in *The Secret Doctrine*.

The groundwork of the design is a dark green and the zigzag lines which entirely cover it symbolize the mystical Waters of Space, "Chaos," or the Deep, the Father-Mother of all, including the gods. At the top is Osiris, with body bent back in the form of a circle enclosing a white space. The text says it is Osiris who forms the border enclosing the Tuat (Tiaou), the Underworld or inner spiritual kingdom of forces. It is the circle of Wisdom in infinity, the serpent biting its tail. A goddess (Nu) springs from the head of Osiris and holds the Solar Disk, RA, the Egg of Life. Next to this is the Beetle of Khepera, a symbol of ever-renewing life and reincarnation, and the "fall of mankind into generation." Standing in the boat, called Solar, but which is really Lunar-crescent shaped, are ten deities, including Isis, Nephthys, and Seb. Below is the god Nu, holding up the boat. It may be that he is only a personification of the celestial waters, behind which lies the unseen Deific Energy, but a comparison with the second diagram throws some doubt on this, as will be seen later.

One thing more is worth noticing, which will prove interesting to students who have worked at some of the deeper meanings of H. P. Blavatsky's instructions: i. e., the general arrangement of the three principal components of the design. Above is the White Circle, the "Great Breath," surrounded by the first emanation of Deity, "Osiris," next comes a rectangular space, the "Square," and below an inverted Triangle is formed by the uplifted arms.

Turning to the second figure, a singular resemblance of certain portions to the chief features of the first commands attention. As in the diagram of the Creation, there are two *inverted* symbols above—in this case repeated four times, the Lunar crescent near the middle, and the uplifted arms below. The upper manifested circle is not shown, but, as will be seen later, is suggested.

The interpretation of this diagram is generally taken in a more limited sense than that of the other, the Creative hieroglyph. This one certainly represents six of the "seven principles" of man's nature; in another somewhat similar diagram, the seventh, Âtmâ, the Spiritual Sun, is shown as the dominant figure (the circle).

One of the greatest difficulties that meets the student of Egyptian symbolism is the variety of names and gods representing the same idea under slightly different aspects; but as it is well known that the full teachings upon any of these esoteric subjects have never been given out publicly in such a clear form that they could be misused, these apparent confusions and "blinds" in the Egyptian system are exactly what should be expected. So in coming to some decision that the various symbols mean certain things we should never forget that there must be far deeper meanings visible to those who possess the higher Wisdom. After comparing the statements of the best modern archaeologists upon the "seven souls of man" (!) with the numerous hints given by H. P. Blavatsky in her comments upon the opinions of Gerald Massey, Lambert, and others who have paid special attention to

the subject, the following explanation seems to meet the most palpable difficulties. The second figure is copied from an article in an old number of the *Revue Théosophique*, which was published under H. P. Blavatsky's auspices.

The kneeling figures represent the physical body (Chat or Khat). The fishlike symbols in front of them (Bas), and the uplifted arms (Ka), stand for the lower principles named by H. P. Blavatsky the Astral Body, the Kâma or animal soul, and Prâna, the vital energies or Solar force. There is some uncertainty as to which is which, and it may be that some of these principles are interchangeable according to the point of view. As Kâma becomes a form (Kâma-rûpa) after death, the Egyptians may have let the formative instruments, the hands, represent this. The next principle, the Lunar crescent (Ab or Hat), is the human soul, the Lower Manas of Theosophy. It is the heart in the vase or urn which is weighed in the presence of Osiris in the well-known Judgment-scene. It is the middle point, the balancing-point, and from it the free will of man can raise him to the heights or plunge him into the abyss.

Now we leave the lower personality and arrive at the Higher Ego or the Higher Manas (Ba), typified by the bird symbol—always a sign of the spiritual power—and *Chayb* or *Khaibit*, the "Shadow." The latter is the Spiritual Soul or Buddhi of Theosophy; it is the veil or mediator between the reincarnating Ego, Ba, and the highest Divine principle, which is not shown here but is suggested by the inverted position of the two highest principles, indicating that they have come down from a superior source.

In some texts two more principles are given: "Name," *Ren*, and "Power," *Sekhem*. The meaning of these is obscure and they may be subdivisions of some of the others.

It seems remarkable that the knowledge of the complex nature of man has been so nearly lost in the West; but perhaps this is not so striking when we consider the desperate efforts which were made by monkish ignorance to destroy or conceal every vestige of what was called "Paganism." Much remains to be discovered, and we are hardly on the verge of knowledge that was familiar to the ancient Initiates of Egypt and Greece. For instance, Plutarch shows by his writings that he knew more about the nature, origin, and destiny of man than the psychologists of modern civilization; and St. Paul, a wise *master-builder*, speaks with perfect confidence of at least four principles in man. It would seem that in this dark cycle of spiritual knowledge Nature will not force unwilling minds to see what is just beyond the veil; but for those whose intuition has developed sufficiently to know that modern science does not hold the key to the mystery of man's nature, the glimpses of archaic science which have come down the long vistas of time are of some value, even if only to stir the imagination.

A comparison should be made of the two illustrations, and careful students will probably be able to see much more than has been suggested here. Is it not possible that each Hieroglyph contains more than one meaning? Perhaps they *both* represent the Creative design as well as the Septenary division of man—and what else?

STUDENT

Cannibalism Scientifically Correct!

THEOSOPHISTS and others have often pointed out the danger of attempting to infer principles for the guidance of life from the observations and reasonings of physical experimentation. No doubt the inductive method would lead to truth if it were possible to apply it *fully*; but it is quite impracticable to observe with absolute precision the facts of nature or to take into account *all* the facts; hence the conclusions reached must be faulty. In general, scientists, when they pursue this method, reason from a few facts only; and it is only after their theories have proved to be inadequate, that by an extended observation, they discover other facts which they had previously overlooked.

But we seldom find such a frank admission of the difference between scientific conclusions and conclusions drawn from other sources as in what follows.

A doctor has come to the conclusion that cannibalism is quite correct, scientifically if not ethically; and that if we object to the practice, we must object on other than physiological grounds. Note the distinction he draws between ethics and science, and the admission that physiology may lead to conclusions repugnant to the general sense.

Experiments were made with frogs, by feeding them with the flesh of other frogs, when it was found that they showed a greater increase of weight in a given time than when fed on veal and mutton. Irreverent people may want to know what this has to do with mankind, since mankind does not propose to go in for hopping and croaking and wallowing in the mire at the bottom of ponds. If it did, then the example of a frog might well be useful; but otherwise it were best not to imitate the regimen of that animal. Again, does man aim merely at increasing his weight at the greatest possible rate, expressed in grams per second?

If the above is to be taken seriously, it shows that science (of this kind at least) is an exotic, not intended for serious use but merely as a curiosity. The case is an extreme one, and would perhaps better be dismissed with a laugh; yet it does serve to illustrate a general fallacy, which in less extreme cases may escape notice. Such scientific reasoning sometimes leads to queer conclusions and affords an apparent justification for things we know to be wrong. Because observers fail to discern *all* the doings of Nature, they accuse her of wastefulness and futility! Because they fail to penetrate in full either her motives or her results, they accuse her of cruelty and want of heart! Having inferred, from a minority vote of the facts, that man is but a higher animal, they want us to imitate the animals! Believing that knowledge depends more on the use of the bodily senses than on the cultivation of man's higher faculties, they advocate barbarous methods of research; and the knowledge thus gained, if any, is like that which might be gained by a man who should put out his eyes in order to burrow like a mole.

Let us beware of laws of life inferred solely from a so-called physiological basis; for, unless that basis be absolutely correct, the laws will be wrong. And we have good reason for believing that it is not absolutely correct; indeed, it is not even fixed.

The Reincarnation of the Morris Dance

THE Morris dance! How many quaint old-world associations the very name revives! One is carried back to the Middle Ages when life was less complex and simple pleasures only were obtainable. There were not too many ways of "killing time" then, and people had to exercise the imagination and make the best of their immediate surroundings; and they probably did not suffer thereby. As a child derives less enjoyment from a costly outfit of toys than from some old battered doll or a few wooden blocks, because the former gives less scope for its vivid creative imagination, so our modern ways have deprived us of much, including the keen appreciation of elemental nature.

But, after all, human nature is much the same as ever, and the successful revival of the ancient Morris dance in England is a proof that we have not all become irredeemably conventional. It is a curious and hopeful sign of the times.

A philanthropic worker among the "submerged tenth," Miss Margaret Hughes, was lately inspired by the idea that much pleasure and profit could be brought to the young folks in the dreary wildernesses of London by teaching them the dances and games which held so important a place in building up "Merrie England." Her success in brightening their lives and bettering their health has been so marked that the London educational authorities have taken the matter up with enthusiasm, and now Miss Hughes is training the teachers in the public elementary schools in the art. The demand among the children for places in the classes has been extraordinary, and some public exhibitions they have given in the public squares have aroused great interest. This movement seems to be a step towards a more humane and rational system of education.

The Morris dance is supposed to be of Moorish origin—whence its name—and to have come through Spain; at first all the performers blackened their faces. Before long, however, its Oriental character was modified, and Robin Hood, Friar Tuck, and Maid Marian became the leading characters. It has been practically extinct for many years, and Miss Hughes had great difficulty in getting the necessary information.

In Ireland the national dances have not entirely disappeared, for the jig is still popular. It is danced at the cross roads on Sunday afternoons, or at indoor merrymakings, often on a door that has been taken down and laid on the earthen floor; and in Scotland some old forms still linger; but the more dignified and symbolic ceremonial dances of the Gaels

seem to be extinct. In harmony with the customs of the rest of the ancient world symbolic dancing must have prevailed in Western Europe formerly, for the art has not always been a mere pastime. The ballet or the waltz is a poor substitute for the Pythagorean dance of ancient Greece, or the Astronomic dance, derived from Egypt, which Plato regarded as a divine institution.

In Greece, and even in Rome to some degree, the art was a representative, organic

This dance, as it was produced on the Athenian stage, is said to have been so terribly realistic that many of the spectators rushed affrighted from the theater, imagining that they really beheld the dread sisters whose very names even they did not dare to mention. These awful ministers of divine vengeance, who were supposed to punish the guilty both on earth and in the infernal regions, appeared in black and bloodstained garments. Their aspect was frightful, and their countenances livid with the hue of death. Their heads were wreathed around with serpents in place of hair, and in their hands they carried a whip of scorpions and a burning torch.

Greek dancing became degraded as the nation lost its vitality, but a relic of its ceremonial survived in the Christian Church, for in the first centuries A.D. it was customary for the bishops to lead the sacred dances in the churches. They were discountenanced by St. Augustine, but they were still performed in Spain until late in the eighteenth century, and a survival exists today in the curious ceremony of the "Massarabian Mass" in Toledo Cathedral.

Among the American Indians dancing is a highly important ceremony. The famous snake-dance of the Indians of the Painted Desert, during which the Initiates or Priests of the Bow and the Antelope handle deadly rattlesnakes with impunity, has a religious object. It is commemorative and sacrificial, and its ostensible aim is to propitiate the "Trues," "Those Above," to send the needed rain to a thirsty land. These Indians have many remarkable sacred dances the details of which are very suggestive to the student of Theosophy, for they contain unmistakable traces of the Wisdom-Religion or Theosophy, which came to them from Atlantis.

Modern ball-room dancing shows a decline of taste and knowledge; it is a degenerate caricature of the real art, and it is not surprising that an Eastern potentate wondered why the *sahibs* did not get their servants to do it for them! Katherine Tingley, a few years ago, at Point Loma, established an entirely new order of Rhythmic Motion, an antique and stately form, which carried to those who had eyes to see, a profound significance, and she has since taught the Rāja Yoga children several exquisitely beautiful dances which are instinct with new life and meaning. Some of these were shown to the public in the presentations of *A Midsummer Night's Dream* and *The Merry Wives of Windsor* which were given by the Isis League of Music and Drama under Katherine Tingley's direction a few years ago, and were received with great enthusiasm.

One looks ahead to the day when the pure and stately ceremonial dances of the ancients will be restored to their rightful place in the world's life, for there must be many who would welcome the passing of the present degenerate type. A STUDENT OF ANTIQUITY

ONE OF RAFFAELE'S "PUTTI"

TO gild refined gold, to paint the lily,
To throw a perfume on the violet,
To smooth the ice, or add another line
Unto the rainbow, or with taper light
To seek the beauteous eye of heaven to garnish,
Is wasteful and ridiculous excess.

Shakespeare

whole, expressing the profoundest religious thought of the people as well as their lighter moods. The terrible aspect of the law of Karma was enacted by the Erinyes, its ministers, in the *Eumenides* of Aeschylus. A historian gives us the following description of it:

Is Theosophy Opposed to Christianity?

THIS is a question which has many times been asked and answered in these pages. But the answer seems to be one which requires reiterating.

An unprejudiced inquirer might well wonder just what is meant in the term Christianity. Will all the hundreds of sects come together and agree as to what Christianity really is? And if, indeed, it were possible to obtain the consensus of today's opinions, this same unprejudiced inquirer might yet be excused if he should ask whether this represented Christ's teachings better than the accepted versions of a century ago; or whether, in fact, since each century, down through the ages, seems more or less to have contradicted that which preceded it—whether, in fact, any of them can be implicitly trusted.

Theosophy—or its organ today, the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY—has neither time nor inclination to attempt to settle disputes among these thousands of disputants. It is concerned with larger issues. It has undertaken the gigantic task of uncovering the kernel, the essence, the glowing life which is the basis of every religion the world has ever had. It is searching deep, deep, under the volcanic eruptions of human thought which throughout the ages have piled higher and higher, and buried the truth from the knowledge of men. And it is searching not vaguely, as one who wonders where to go, but directly, as one who understands well for what treasure he is seeking and knows where it lies. It is opposed to all that has concealed this treasure in whatever quarter of the globe it may be found. And however it may offend the vanity of the "Chosen People," it affirms that mankind has never been without the Light, nor the possibility of finding it.

All-embracing Love knows no partiality, and has sent the rain from heaven upon the just and the unjust. And all-embracing Wisdom has been able to judge what spiritual food would best feed each group of its children,

notwithstanding the opinions of the "Chosen People" to the contrary, who have insisted that all must eat of their food or starve—their food, not as it came to them from heaven, but as they have adulterated and served it.

But Theosophy is universal in its sympathies and its aims, and holds, that when the Light of each religion is allowed to shine in its purity, the union of all these rays will produce a glory such as has never shone upon this planet

SPRING

DECKED is her newly-budded breast
With gracious roses white and red
And graciously upon her head,
As crown-wise, grape leaves rest.

The dandelion's yellow showers,
Like golden buttons, clasp her dress—
That in its em'rald loveliness,
Is 'broidered thick with flowers.

A thousand birds her advent brings
To swell in song their pretty throats,
Fit chorus to the vibrant notes,
Struck from the wind harp's strings.

And earliest of the feathered throng,
That winged sapphire, the blue bird,
Makes his soft silv'ry flute be heard
The far cool hills along . . .

as yet. It holds that the cosmic forces are moving towards this mighty culmination, and it is working with them. STUDENT

'The Appearance of Evil'

OVER two hundred centuries ago, into a great epic were wrought pictures of womanhood and maidenhood which must always serve as an inspiration. Especially must these be so to those women and girls who are learning to sound the depths of their own natures and to find there resources of which they can avail themselves instantaneously when there is a need for quick decision requiring careful judgment. Countless are the

snare, wide open and enticing, which life has always offered to the woman who has not learned, as had the Grecian Princess of Phaeacia, the necessity of avoiding the appearance of evil.

In the Odyssey we read that the beautiful Nausicaa was quite undaunted in her attitude towards the stranger who so abruptly appeared upon the scene of her happy sport with her attendant maids when the cleansing of the linen was over. She was a princess and felt the responsibility of exercising the prerogatives of one, and she had the fearlessness of innocence. But even her interest in the kingly stranger, whom she befriends and directs to the palace of her father, does not lead her for one moment to forget what is due to herself as a maiden, and she is careful to detach Odysseus from her train of maidens lest she be seen in company with a stranger whose presence might be questioned by one prone to attribute evil.

To me belongs
The care to shun the blast of slanderous tongues;
Lest malice, prone the virtuous to defame,
Thus with wild censure taint my spotless name:
"What stranger this whom thus Nausicaa leads?"

"To me belongs"—here is the recognition of the responsibility which most often is not felt until it is too late, and an impulsive word or act has already laid the unwary one under the subtle influence exercised by "the appearance of evil." A very subtle influence it is. A very delicate sheath of the inner being has received a wound, and explanations and apologies, while they may appeal to the mind of the censoriously inclined, will not hinder or put an end to imputations and suppositions, which continue to be uttered and constitute an actual menace and temptation to the person involved. And then the strange psychology which an imprudent act exercises over the actor. How strong it is! Before that act a certain idea or picture of herself and her own character has been held in mind. This has been shattered and there is a period, short or

long according to the comparative seriousness of the indiscretion, when the fault has to be faced and a new idea of herself constructed, including the weakness of having failed at a moment of test. This is a very critical time in character-building. If self-justification predominates there is a good chance of the "appearance of evil" getting in its subtle work and encouraging an imprudent habit; and at any rate, before a woman or young girl has wakened up to the necessity for making of mistakes a stern self-tuition, and accepting them as warnings, there is nothing reaped from them but regret and a tendency to repeat them at another unguarded moment.

The unguarded virgin as unchaste I blame.

Thus Nausicaa, wiser in her day and generation than are many today, when the protection of old-time restraints and conventionalities has been removed from even the youngest maidens in many walks of life, and we have to contemplate wrecks of girlish character and morals which might easily have been avoided if the girls had been guarded as people hundreds of centuries ago made a business of guarding the daughters of the home. The Princess Nausicaa will stand ever as an example of a maiden, who, having been thus shielded, could at a moment of emergency exercise the wit to protect herself and her companions from the slightest imputation of evil.

The beginning of carelessness with regard to possible imputation of this sort may be about something that to some might appear trivial. A refined, high-minded woman in very delicate health once found herself an unwilling listener to a conversation being carried on inside a room before the open window of which her chair had been placed. Casting about for a means of getting away, and feeling rather helpless, it did not occur to her at once to make some sound to warn the speakers that their conversation was audible to a third person. Imagine her dismay when very suddenly the voices were lowered and the window near her was drawn down by a decided hand. Her only offense was that she did not think quickly enough; but a very few moments suffice to convince people of the lack of breeding in others; and after all, does it not show a lack of breeding to fail to think quickly at the time when one must act quickly? The lesson was never forgotten, though the same hesitancy on similar occasions required an effort of the will to overcome.

Why are women and girls not alert at every

moment to the possibilities of the present situation, whatever that may be? Why can they not draw upon the store of past experience that lies within them and act throughout, first a day, then a month, then a year, and then a lifetime, with all the wit and all the heart which they sometimes show? Why do we feel about some whom we love, maybe, that we can never tell what they are going to say or do next? Why do so many good and helpful people have to spend days patching up the

readiness, their appreciation of the worth and power of chastity, their caution, their ability to deal with a situation in such a way that honor redounded to the fearless and innocent and reproach only to the guileful, offer us many lessons. When mother-wit is applied by women who know their divinity, trust in it, and have ideals of life which include a conscious exercise of the full womanly power to stamp every situation with a compassionate, uplifting influence that enriches all life, we shall have again those who were allies of the gods in happier times, women to whose protection all the sufferers and wanderers may safely be directed, as was Odysseus to Arete, the goddess-like mother of the beautiful Nausicaa.

Jottings and Doings

(From a Student's Note Book)

WHAT next, what next? With several Homers—and also none—with Bacon as author of the immortal dramas that some still believe to have been written by one William Shakespeare; with King Arthur doing duty as a myth: is it possible that the particular form of imbecility which is responsible for these theories is still claiming fresh victims? It would so appear, for now we learn that Joan of Arc was never burned at the stake at all, but that the "Duchess of Worcester" kindly suffered in her stead!

The inventor of this ingenious theory—Wrigglesworth by name—has overlooked, however, two important facts which might seem to the ordinary unscientific observer to have a bearing on the matter, namely, that no "Duchess of Worcester" can be found to have existed during that period, and also that the fact of the Maid's execution is perfectly authenticated, not only by the accounts and statements of

eye-witnesses but by the depositions of many.

A YOUNG American woman who has been for some years occupied with teaching-work in Japan has recently been granted naturalization as a Japanese citizen by the Japanese Home Department. It is stated that this is the first instance of the kind in that country.

AN English gentlewoman has just published a cook book, a quite new departure being the attention given in its pages to the proper cooking of vegetables. Many homes that are not English would benefit by reform on this line, homes aristocratic as well as plebeian.

rents in human relations caused by want of thought? It is because they, the generality of women, young and old, are not on guard. They have not sufficiently identified themselves with the Soul, the real Self, to keep in touch with the wit and wisdom stored there. Situations do not present themselves as fraught with the immense importance that they all have; and the generalship so tactfully and beneficently exercised by an awakened woman in these situations as they arise, is very often an untried power, except in petty conflicts for gratification of desire.

The women of the epics and legends are a reproach to us in this very respect. Their

A LESSON IN FORESTRY RAJA YOGA BOYS AND THEIR TEACHER IN THE EUCALYPTUS GROVES, POINT LOMA

Lessons From the Life of William Q. Judge

"Great is he who consecrates himself."

AS the years pass and young folks the world over learn more about the noble ideals of life and service taught by Theosophy and forming the basis of Rāja Yoga, greater and ever greater grows their gratitude to William Q. Judge, who received these teachings from H. P. Blavatsky and guarded them so faithfully, planting them whenever and wherever he could, until the time came when Katherine Tingley should found the Rāja Yoga Schools and spread Theosophy broadcast among young folks everywhere.

One of the first teachings of Theosophy is that human beings are Souls, and the first test of a man's greatness is, Did he live as though he believed that he was a Soul? This is precisely what William Q. Judge did. He acted as if he knew that he had lived and experienced so much before that this time he must do and say and write just what would help all Humanity the most — not stopping to think of fame or pleasure or of gaining wealth, but ever giving and serving and fitting himself to give and serve more. The quiet, steadfast way in which Mr. Judge did every duty showed that he knew his own divinity and that guided by this light within he did what was of the utmost importance in the world at the time he lived, though sometimes there was hardly another person who was wise enough to recognize it. This power to keep on doing what he knew to be right, through

opposition and spiteful attack and mean distrust, must have been built up in many lives of service to Humanity; and the man who could do it saw deeper into life than others, and from the knowledge that he was a Soul, and that men must learn that they are brothers, he gained inspiration for new efforts.

If ever anyone was a vigilant protector of Truth, William Q. Judge was. Few people understood Theosophy. Few would begin to try to live purely and truly, and face their faults; so of course they could not understand the great teachings H. P. Blavatsky brought; and they would very soon have sullied these great ideas with foolish notions of their own and given them out as Theosophy; but William Q. Judge was on guard. He had pledged himself to keep intact what the human race is in such need of, until a time should come when there would be more who could learn the Truth; and he did it. How hard he tried in his books, in his articles and stories in the *Path*, and in his letters to people, to put Theosophy simply so that everyone could understand its teachings! He tried in so many different ways too. He lectured; he presided at meetings where there were discussions; he wrote learned articles, and articles that were so clear and simple that people did not dream how much truth they held; and sometimes Mr. Judge wrote wonderful stories in which the truth was taught in a symbolic way. And then he translated from the sacred books of the East. Many people believe that if Mr. Judge had never done anything but edit the *Bhagavad Gītā*, he would still have done a

wonderful thing to help the whole world.

There was a time when William Q. Judge was H. P. Blavatsky's "only friend." He alone in the world saw that the way to second the efforts of the first great Teacher, was to accept her suggestions and steadily carry on the line of work advised by her. Hundreds of people admired H. P. Blavatsky and followed her about begging for crumbs of her wisdom and proclaiming her as a wonder. Very often they ended by slandering and abusing her. But William Q. Judge listened to what she said, and without *any* criticism tried to follow her ideas. He kept at work; and while others were wondering and talking he built up an organization and had people gathered together in groups and lodges to learn about Theosophy. It is very sad to read about all the wealthy and famous people who came face to face with H. P. Blavatsky and did nothing to help her in her work for Humanity. William Q. Judge set to work at once. He seemed to have been waiting for a signal from such a Helper.

Because William Q. Judge was ready to serve Humanity; because he so promptly answered the call; because he never wavered in the performance of duty but did every act as if it were a loving service to a brother; because he knew his own divinity and hence was able to do the right thing at the right time and in the right way; and because his life was dedicated to the great purpose of uplifting the race, he stands as a new and nobler ideal of manhood. This ideal is a cherished one in many young hearts.

LOTUS BUDS IN THE ROTUNDA AT THE RÂJA YOGA ACADEMY, LOMALAND

William Q. Judge

April 13, 1851—March 21, 1896

LOOKING down upon these happy Lotus Buds in the Rotunda of the Academy in Lomaland, is the wise, kind face of William Q. Judge. It is well known to all the children; and as they gather there for practice in song or dance or drama, or for their Lotus Group exercises, the love in their hearts for this great man can be seen in their faces, as they pass the carved stand which holds a bust of him and whisper to each other, "See it is William Quan Judge."

The smallest of them knows that when H. P. Blavatsky brought the teaching of Brotherhood back to the world, it was the beginning of many beautiful and happy things for children; and they know that William Q. Judge worked very hard to help Brotherhood to grow in people's hearts and that he kept on teaching people about it so that by the time Katherine Tingley came there were many who believed in Brotherhood, and then came Râja Yoga. And now, schools in so many places, and happy Râja Yoga pupils, and more and more Lotus Groups.

William Q. Judge began, when he was a little boy, to show that he would not be held back from doing what is right, by any obstacle.

Sometimes these obstacles are in children themselves; sometimes they are outside them; but a Warrior, such as Mr. Judge was, who knows the meaning of "Try" *can* overcome; and William Q. Judge did. Mr. Judge often lectured to great audiences in cities. The first time he tried to speak, when he was a little boy at a debating club, he could not utter a word, he was so shy and embarrassed. But he kept on trying and it was not long before he could speak easily and remarkably well.

Mr. Judge believed that there should be a great printing-house where books about Brotherhood were published and sent all over the world. It was not very easy to start such a thing, for it took money and workers, but he did it; and now, because it was a seed planted at the right time, this work has grown into a very large establishment and books, papers pamphlets, magazines, are sent off in great loads, and people everywhere hear a great deal about Brotherhood. Happiness is creeping in, in this way. The Aryan Press, started by Mr. Judge, began this way of helping people to learn Brotherhood.

Sometime when you are very busy, when you think that all your hours and half hours are filled up and you cannot try to do one more thing even if it is a simple little act of

kindness, remember Mr. Judge. He was a lawyer and was busy with his practice. He edited the magazine, the *Path*, and sometimes he wrote all the articles in it. He held meetings. He wrote books and newspaper articles to tell people about Brotherhood. He wrote thousands of letters to people who wrote asking him for advice. But he was never too busy to do little acts of kindness. Many, many people remember how gentle and patient and kind he was. And he was always ready to give more service. Busy as he was, when there was no money to carry on Brotherhood work, Mr. Judge would sit up at night and paint pictures to sell for money to go on with it.

You see Mr. Judge thought of Humanity first, before any thought of self had time to enter. There is magic in doing this. If you think of Humanity and of helping and sharing, the greatness in your heart blossoms out. If your dearest wish is *to help*, out of your own heart and soul will come the power to help. This is the way it was with William Quan Judge. Every year with the sweet budding springtime our birthday thoughts of this great Teacher and Leader stir in our hearts the will to serve unselfishly in the cause of Brotherhood.

Can the Mind Heal the Body?

A DOCTOR, in the *Saturday Evening Post*, declares that it is one of man's dearest delusions that his body is under the control of his mind.

This is an extreme view. It has been provoked by the overdoing of the mental-healing fad. But common sense does not linger in either of these extremes.

The doctor says that the one thing which man felt absolutely sure he could control was his own mind; and that he reasoned that if the mind could control the body, then man was master of his fate. But, he continues, the science of today is establishing the fact that man's most permanent control over his mind is attained through the body; all our substantial and permanent victories over bodily ills have been won by physical means; and even the large majority of the triumphs over mental and moral diseases have been so won. The mind does exert some influence over the body; but the physical treatment does much more. Psychic treatment is relied upon by shamans and witch-doctors, who are mostly impostors; and their methods have been discredited. The medical profession is opposed to mental healing to the extent that physicians have tested it and found it inferior to other remedies.

This is a good instance of the harm that is done by pseudo-occultism, psychism, and such crazes; they bring discredit on genuine truths, just as false theological teaching has brought discredit upon true religion and caused many to become atheists and agnostics. It is necessary to use discrimination in attacking the evil, lest we inadvertently condemn the good along with it.

And it behooves Theosophists to stand forth and boldly champion the truth that both man's mind and his body are under the control of his Will when it is liberated from desire, and of his Intelligence when it is purified from illusion. To deny this is to make man the helpless victim of circumstances and of the forces of Nature. But it is the Theosophical teaching that Man is, in his *essential* nature, Divine, and superior to all these forces and circumstances. The fact that the average man of today has not attained to this superiority and liberation, does not invalidate the argument, as the answer to that objection is simply that the average man of today has not yet realized anything like his full possibilities. The doctor admits that there are many cases where the statement that mind has power over body

is partially true, and a few cases where it is wholly true. He takes these as exceptions and accepts the existing condition of things as being the norm. But Theosophy is by no means willing to accept existing conditions as being the standard; and it regards these exceptional cases as being but an earnest of the future rule.

The brain-mind stands midway between two classes of influence—those from the body and the physical plane, and those from the Spirit and will. It reacts to both influences. Under present conditions of human development, the body rules the mind to too great an extent; and consequently drugs and foods will influence the mind through the body. But the ideal condition is where Will and Intelligence control mind, and the mind controls the body. Under these circumstances, drugs and other kinds of regimen become aids, perhaps, but not rulers.

But the theories and the many practices of the self-healing cults are well calculated to bring discredit upon the whole question of the power of the mind, for all those who have not had access to the rational teachings on this point. The mind cannot purify the body unless it has first become purified itself; neither can the Will liberate a patient from the sway of the lower forces as long as it is itself under their dominion. And the minds of most of the mental healers are still full of selfishness, delusion, vanity, and other encumbrances. Hence their cures are not permanent and often consist merely in the substitution of one disease for another. The doctors, on the other hand, though they may vindicate the power of physical means, in reality use a great deal of mental influence in the exercise of their profession; but the kind that they use is healthy and natural, consisting of cheering words, common sense, and that most invaluable of assets a hopeful vivifying presence. The presence of a beneficent, healthy-minded physician is about the strongest mental and moral drug that can be administered; and his medicine will do ten times as much good as the same medicine administered by a pessimistic and debilitated doctor.

The mind has power over the body; but we must use common sense. For instance, it would be presumptuous to expect that we can cure at one stroke ailments that we may have been years—perhaps even more than one lifetime—in creating. The body is a great reservoir for accumulating and storing up effects. Its condition rarely reflects the immediate condi-

Genuine and Healthy Influence

tion of the mind; rather it reflects the habit of the mind for a long time in the past. Hence it may be long before our purified mind will be able to reflect itself in a purified body; we have our debts to pay. It is this very obvious

Mental and reasonable fact that has given our doctor a handle for his views. He says that mental cures are only temporary; but very naturally, a single good thought is not enough to undo the accumulated work of years, and after the good mood is over, there may well be a relapse due to the inertia of the body. But mental medicine, like physical medicine for that matter, needs to be administered in frequent doses and persevered with.

It is advisable to add a few words on the difference between genuine and bogus mental healing. In the latter, the patient has in his mind thoughts of self and his mind is in an unhealthy state of self-absorption; hence he engenders unhealthy conditions in his body. The narrowness of his aims causes him to arouse the *lower forces instead of the higher*, with the result that he too frequently merely stimulates his animal forces and falls a victim to their newly awakened power. This sort of thing the doctor very rightly condemns, and in that Theosophists are heartily in accord

Narrow Aims with him; for Theosophy teaches the subjugation of animal and personal forces, not their exaltation. But the genuine mental healing consists in a resolve to lead a more unselfish life, to cultivate purity and honesty of thought, and to resist evil in all its forms. The care of bodily ailments should be entrusted to the hands of ordinary medical skill; the patient should try to forget himself and his ailments, and trust to the inevitable working of the universal law of cause and effect to bring him better bodily conditions just as soon as he has paid off his old debts and earned the right to better conditions.

By looking at the matter in a calm and common sense way, we can allow for all existing limitations without in the least invalidating the general truth that the liberated Will and Intelligence is lord of the mind and, through the mind, of the body; and that Man is in reality the arbiter of his own destiny.

H. T. EDGE, B. A., (*Cantab.*)

Selective Breeding of Humanity

ONE strange fantasy resulting from the application of *so-called* scientific methods to the problems of life is the proposal to improve the human race by selective breeding. A book advocating this proposal, is reviewed in *T. P.'s Weekly*, and the reviewer seems to have his doubts about it. Says the writer of the book:

With the development of knowledge we may expect that there will come a development in the institution of marriage on the lines of prohibiting . . . unions which it is known will result in bad offspring, and encouraging those which will result in good.

Upon which the reviewer remarks that he cannot help speculating as to the benefit that would have ensued to humanity if some such notices as the following were seen in old records:

Considering that one Shakespeare [the father of the dramatist] of this town hath been shown to be

very slothful in business, and to be but of an unthrifty and ill-chanced wit in his buyings and sellings: resolved that he be declared incapable of holy matrimony.

Or this about the elder Dickens:

Mr. Dickens applied for a matrimonial license. Evidence of gross business incapacity and consequent poverty having been given: license refused.

In short there are two objections to the proposal; and it must be admitted that they are important objections. One is that we do not understand the laws of human heredity; and the other is that nobody is competent to judge of the fitness of other people.

What were the principles that determined the birth of Napoleon, Joan of Arc, Beethoven, Lincoln, any great character? Who foresaw them? Who would undertake to reproduce them? What do we know of the offspring of highly endowed parents? Are they always or often highly endowed? Do criminals and degenerates never emerge from cultured homes?

The most absurd feature of the proposal is its assumption that there are two classes of the community, one able to take care of the other. And in this one seems to detect no little arrogance on the part of the theorists who tacitly assume that they and the class they speak for are the superior persons who are to manage the others. Does it never occur to them that there might be more opinions than one on that subject? The idea, of course, is that the body of scientific opinion might be so uniform and influential as to gain control of the governing power in a state and proceed to legislate for the community like some theocracy or despotism. But, as the legislators would have to submit to having their own marital affairs regulated, it is not likely that they will come to an agreement in the near future.

Within certain limits, however, there may be a germ of sense in the idea. In the case, for instance, of an easily definable defect, such as inebriety or insanity, it would be reasonable to prevent procreation (of course by segregation of sexes, *not* by any medical means); and in such a case it might be feasible. But here again it would be necessary to bear in mind that *all* persons coming under the definition would have to be treated alike, no matter what their rank. But the correlative process, that of mating suitable couples with the view of breeding an improved stock, seems quite impracticable in the absence of a definition of such suitability, especially in its relation to procreation.

These proposals are all arm-chair theories, up in the clouds, students' pipe-dreams; and it is surprising so much attention should be given them. And all the time we are missing the ever-present ever-obvious ways of improving the race. Anyone really anxious to improve the race can and should begin instantly on himself, thereby bringing his maximum power to bear on his greatest opportunity. He need not fear lack of occupation, for his influence will rapidly extend to a wider circle. The world is thirsting for true men and women. The sight of such among them would restore their faith in human nature and inspire them to emulation. "Whatsoever is practised by the most excellent men, that is also practised by others."

Let us search out the means of ennobling our own lives, thus rendering ourselves radiat-

ing centers of light and life, and we shall be doing all that is possible for a single being to do, and our hands will be full. If we desire people to take our advice, let us make them respect us, and then they will follow it without legislation.

STUDENT

Can Virtues be Inherited?

SCIENTISTS are still discussing whether "acquired characteristics" can be transmitted from parent to offspring in the animal kingdom; and they are discussing it with regard to the human kingdom also. One group says that acquired qualities (virtues and vices) are not transmitted nor inherited, and the other says they are.

But this question will never be settled so long as scientists recognize only one kind of heredity—the physical. For if we suppose physical heredity to be the only kind of heredity, we are placed in this dilemma: the qualities of a child are either inherited in that way, or else they have been acquired since birth. As neither of these alternatives will suffice to account for all the facts, it is natural that there should be a difficulty about accepting either. On the one hand, scientists can discover no definite law connecting the qualities of the parents with those of the offspring; and so they say that qualities are not inherited. On the other hand it is found that we can not account for all the traits of a person on the supposition that he acquired them all.

The key to the puzzle lies in the fact, recognized by Theosophy, that there are several distinct kinds of heredity in the human being, and more than one in the animal kingdom. We are the offspring of our parents to a limited extent only; they gave us our physical body and some of its accompaniments; but they did not give us all that goes to make up ourself. In the first place there is the Individuality, or real Self, which is immortal throughout the reincarnations; our parents did not give us that. Again, there are many mental and psychic factors that are derived from the general mental and psychic atmosphere of the country in which we were born; so that we may be said to be largely the child of our race. This is why animals tend to perpetuate their type rather than to transmit variations; and the same principle holds good in the human kingdom.

Some of the conclusions at which scientists arrive in trying to solve this question are curious. For instance, some who do not see how qualities are inherited have come to the conclusion that they must be acquired, and hence that all the attributes which distinguish a civilized man from a barbarian have been acquired since birth. A boy brought up amongst savages would be a barbarian. But others recognize that there is a marked difference between the child of a civilized race and that of a barbarian race. Then again, curious educational theories have been evolved from this false reasoning. What is the use, some say, of trying to improve the race by education, if acquired qualities are not transmitted?

We should be in a pretty pickle if all our laws and institutions were to be regulated by these wild guesses; but fortunately there are too many of these guesses and they neutralize each other. The whole thing shows the necessity for greater knowledge of the mysteries of man's nature.

Some Views on XXth Century Problems

Fooling with the Gear

IT is surely a curious sign of the times that a popular magazine should print an article warning its readers against holding their breath! To every one of these readers, a generation ago, the warning would have been absolutely meaningless. Who would have wanted to hold his breath, and what results could he have possibly expected from it?

The warning implies that "psychic powers" are believed in and desired, and that ancient prescriptions for getting them, thousands of years old, are being imported from the philosophical literature of India. It also implies that modern philosophy, whatever it may be as a guide to *thought*, is not found to be a guide to *realization*. No knowledge, in that sense, and no change of being, occurs from a study of it. For though some of these breath-holding aspirants want mystic powers whose nature they have not defined to themselves, others have a purer desire for realization of the inner meaning of life and consciousness.

The ancients held that mind, when stilled as to the incessant changes produced by the stimuli of sense, and thus prevented from turning out to and reflecting external nature, may be turned *in* to reflect the soul. The soul thus becomes self-seeing, self-knowing.

The word used in the old Indian books for this mind is "prāna," usually translated *breath*. It means the totality of motion in and of the sense consciousness; it is that "breath" which, "breathed" into the "nostrils" of the Adam of *Genesis*, made the clay alive; it is *nephesh*. Respiratory breath is but one of the marks of its working. The "breath-restraint" of the old books is sense-restraint, mind-restraint, for the period of the practice. The mind is drawn in upon the highest spiritual conceptions and finally fixed as immovably as possible upon the highest of all.

This was the real teaching of the real teachers of old India. As time went on and spirituality began to lapse, it became necessary for them occasionally to denounce specifically that interpretation which made *prāna* mean respiration and that practice which was actual breath-holding. Śaṅkarāchārya, for example, took great pains to be clear about this. For schools had arisen which taught the false interpretation and practice; and they exist yet — sending emissaries, some of them, to this country who too often mislead the unwary. Some of these "Swāmis" print; some reserve such instructions for their private groups, the people who are willing to pay well for being taught how to wreck themselves mentally and physiologically. Those who persevere *do* wreck themselves.

Is there then *nothing* in the actual breath-holding practice? For the Hindū aspirant who is willing to submit to the fierce discipline, yes. He cuts his diet down to almost nothing; behind him are a hundred generations of spare vegetarians whose thought-atmosphere was exactly at the other pole from ours. And what he gets then is a state somewhat comparable to that which morphine produces in certain natures, an intense psychic *dream*.

In our stream of Western physical heredity this could not be reached, even had one of us the necessary will to undergo the discipline. What may be reached is first a doubly rooted loss of health, from the retention of products that respiration should get rid of, and from the injury to the respiratory rhythmical center; secondly an injury to the mind from injury to the subtler nerve elements, showing itself as total loss of the power of concentration.

But the real practice is open to us, and we ought to pursue it. It leads to knowledge, peace, and divine realization. STUDENT

Civilization

TWO years ago Professor Charles Bushnell of Washington was considerably criticised for his assertion that vice in this country has reached such a point that the diseases flowing from it entail on us an annual direct or indirect money loss at least equal to the total wage income of all our mine workers or all our farm hands.

His statement was carefully put on the back shelf out of sight; but it seems worthy of being kept in sight and meditated upon. For scattered batches of statistics, turning up from time to time, uniformly substantiate it.

The last of these is from the United States District Attorney, Chicago. Speaking from his official knowledge, he says (using, not inappropriately, the columns of a women's journal):

The evidence . . . leads me to believe that not fewer than 15,000 girls have been imported into this country in the last year as white slaves. . . . It is only necessary to say that the legal evidence thus far collected establishes . . . that the white slave traffic is a system—a syndicate which has its ramifications from the Atlantic seaboard to the Pacific ocean.

This 15,000 of unhappy victims is now an *annual* importation, an annual *importation*—it is worth while to write it twice so as to get the full inwardness of the two words. And as the Attorney points out, this army is but a small fraction of that recruited within our own borders, daughters of our own country.

As to the disease, writing where he does, he cannot say much, merely one pregnant sentence:

I would say that the investigations of the United States District Attorney's office in Chicago have brought together as legal evidence, a mass of facts as to sanitary conditions in the districts where the "white slaves" are kept, which are horrible and scarcely capable of exaggeration.

Since all other cities have similar districts we can make our own picture. We have, say 150,000 annual additions to the army, mostly aggregated in fertile culture grounds of the worst of human diseases.

And every New Year the leader writers spread us a few optimistic columns of answer to such questions as, Are we progressing? Is there more happiness than there was?

The picture may as well have a few more details. Said Professor Bushnell:

Ten millions of our people—one-eighth the population—now are constantly in such poverty that they are unable to maintain themselves in physical efficiency, and 4,000,000 of them are public paupers.

Suicides are increasing five times as fast as

the population; murders and homicides, three times. There is an average of one divorce to every ten marriages. And the drink bill, which in 1899 was 970 millions of dollars, was 1500 millions eight years later.

Still, our wealth is of course unparalleled; and our navy magnificently girdled the globe without a mishap. STUDENT

The Root of Some Crimes

A MEDICAL contemporary reports the case of a physician who, stimulated by the present wave of psychical research, tried a long series of experiments with his own daughter. Night after night, sitting on opposite sides of a wall, they alternately tried to impress each other with a thought, number, card pictures, and so on, the would-be-receiver making himself or herself as negative as possible. Some success followed, but in a little while the doctor began to hear voices. At first unworded, they soon took the form of suggestions as to his own conduct, comments upon other people, and finally of invitations to suicide. The comments related to a plot which they represented as developing, casual persons being conspirators against his life. In his daughter symptoms of hysteria began.

He was wise enough to recognize the connexion of all this with his experiments and stopped; but the results in both continued for many months afterwards.

Both of them were inducing the hypnotic state, pre-eminently a state of negativity. They entered it with the idea of receiving something, and they received accordingly: the girl, waves from her now ungoverned emotional nature; the man, stray echoes, half rationalized in form, from the depths of his subconsciousness. He recognized these as what they were, semi-external to his proper thinking self. Had his judgment been a little further weakened, he would have regarded them as *his* thoughts—that is, would have been a lunatic.

In the ordinary hypnotic state, whether induced by a layman, a doctor, or a reverend, vague tendencies to foolish, mischievous, or wicked action, take shape in the subconsciousness and afterwards come up into the mind. Some also come across from the consciousness or subconsciousness of the operator, quite apart from what he may say. When they enter the mind they have all the marks of the subject's own ordinary intentions and he acts on them as naturally as upon any other of his intentions. The fleeting instant of perception of their irrationality or moral obliquity is instantly covered by an automatic bit of mental self-excuse.

The once-hypnotized person is less responsible for his actions; the many times hypnotized person may not be responsible at all and may easily be a peril to society. Besides being at the mercy of his own subconsciousness, he may at any moment come under the influence of one of those crime-pictures of which the air is so invisibly full, accept it as his own plan and act it out. Are we sure that we always know the wires to which a Guiteau, a Booth, or a Czolgosch dances? STUDENT

Archaeology Palaeontology Ethnology

An Ancient Scandinavian Calendar

IN 1886 an English clergyman obtained from a native of Lapland a runic calendar which the latter had been in the habit of carrying about with him; and Professor Eiríkr Magnússon, of the Cambridge University Library, communicated in 1878 a paper on this calendar to the Cambridge Antiquarian Society. It is engraved on six plates of reindeer horn, bound loosely together by a thong passing through holes, and gives the feast days and saints days of the ecclesiastical calendar.

The most remarkable peculiarity is that there are 364 days to the year, and the commentator asks why this is. Searches failed to find any other runic calendar with this peculiarity; and, as the carefulness of the copy precludes the idea that it is a blunder, the conclusion is that the copyist did it on purpose—in obedience to a tradition in which he had more confidence than he had in his model. And in fact there is such a tradition of the use of a year of 364 days by the ancient Scandinavians.

As late as the middle of the 10th century the "heathen" Scandinavians counted 12 times 30 and 4 days more to the year. Ari the Learned mentions in his *Íslendingabók* (circa 1133 A.D.) that the inhabitants of Iceland were puzzled how to settle the difficulty of the recession of the civil seasons owing to the use of this short civil year, and that Thorstein the Swarthy had a dream in which he was directed to add an extra week to the 52 every seventh year.

We therefore see that previous to the introduction of Christianity, the ancient Icelanders had been counting 364 days to the year. The commentator gives proofs that this custom was imported from Norway. Incidentally he remarks:

It would be difficult to mention anything connected with the history of human civilization and culture to which man clings with such a stubborn conservatism as ancient calendrical and computistic traditions.

And he attributes this to the supposed fact that such calendars were derived purely from crude observations of the seasons; a circumstance which, in some way not very easily understood, is supposed to have rooted the tradition firmly in the popular affections. But we beg to take issue with this conclusion. It can be shown by reference to the traditions of other ancient countries that short years were universally used—not by ignorant people who did not know of the actual tropical and sidereal years, but by people who did know of them and used them. In fact they used a number of different years. To give an instance. An unsigned article in *The Theosophist*, reprinted in *Five Years of Theosophy*, p. 389, says:

Three different methods of calculation were in use in India at the time when Buddha lived, and they are still in use in different parts of the country. These methods are known as *Sauramānam*, *Chandramānam*, and *Bārhaspatyam-mānam*. According to the Hindū works on astronomy, a *Sauramānam* year consists of 365 days 15 *ghadyas* and 31 *vighadyas*; a *Chandramānam* year has 360 days, and a year on the basis of *Bārhaspatyam-mānam* has 361 days and 11 *ghadyas* nearly.

All these based on crude observation, eh, Mr. Magnússon? With their odd fractions and all? In the *Sūrya-Siddhānta* the year has 360 days in one place and 365.2587 in another; there are also three kinds of months, lunar, solar, and calendar. The Egyptians used a year of 365 days exact, in conjunction with

Lomaland Photo, and Engraving Dept.

OLD ROCK-CARVINGS, NEW MEXICO

a major cycle of 1461 of that year. Some of the ancient Americans, as we are informed by those who have translated their stone calendars, were fool enough to go on using for immense periods a year of 260 days, composed of 13 times 20—founded on observation of the seasons, Professor? For more instances we must refer the reader to H. P. Blavatsky's *The Secret Doctrine*, where he will find enough of the same sort to set his brain whirling in cycles large and small like those of the celestial orbs themselves.

In short we do not for one moment believe that the year of 364 days was arrived at by ignorance or guesswork, but that it was one of the different sorts of year used by those initiated in the ancient Mysteries; and that a knowledge of these cycles and their meaning is the clue to some of the profoundest secrets of that ancient science. Nothing is more certain than that the Hindūs used lunar years, quadrated years, and other years, while at the same time knowing, as their books show, the actual length of the sidereal year (at the date referred to) to the last decimal place. Much more could be said on this point if it were thought desirable to do so; but the above will suffice for the present.

The calendar in question began its year on December 23, which also affords the commentator food for speculation about the various dates which have been used at different times and places for the beginning of the year. December 23 obviously refers to the sun's entry into Capricornus, a date which would shift about within the limits of a few days owing to the use of inexact civil years. Christmas day is the same epoch. Other peoples have begun their year at other quarter points.

Since the above was written, there has come to hand one of those occasional accounts of the discovery of a new principle in astronomical calculation. One seldom hears of these discoveries again; the discoverer is usually too much out of tune with current thought to command attention, though perhaps his chief fault was that he could not keep his discovery to himself. The story is as follows:

That the world-old laws governing the movements of the earth and the sun and their relations to each other are fallacious; that an entirely new astronomical system based upon a hitherto undiscovered set of laws whereby a calendar year will consist of exactly 364 days . . . and that the proof of the system can be

verified beyond a doubt by means of scientific instruments now at hand, is the sensational and startling theory set forth by Robert J. Hodge, a humble house painter. (*Boston Post*)

The discoverer expects to revolutionize astronomy and gain the Nobel prize. He has made a great many observations with instruments made by himself, and one gathers that he reconciles the recurrence of the seasons with his short year by establishing other cycles which represent other periodic motions of the earth. His discovery is said to make clear the location of geological strata and precious metals and all sorts of other cosmic problems!

Thus this man has arrived by observation at the same result as the ancient Scandinavians. There seems little doubt that once in a while somebody recovers a little past knowledge—and W. Q. Judge states that Atlanteans are reincarnating in modern Americans; but as a rule they are out of touch with the times and suffer neglect or persecution. That point about the other cosmical

secrets depending on this mathematical discovery is important, because it bears out the Theosophical claim that Science is a whole, its various parts being interdependent and related by exact correspondences, and that one key will unlock many doors. There are secrets in connexion with numbers which would clear up many mysteries. Many great astronomers have suspected this.

An old file shows us the following clipping from the *Los Angeles Herald* of February 2, 1902:

A New System of Calculation: Peter Hofman Would Cause a Revolution in Astronomy with His New Computations.

Then follows an account of this man, a cabinet-maker, native of Prussia, who has evolved from his inner consciousness a system of calculation that measures all visible space. With it a child of six, familiar with the rule of three, may measure the distance of the stars. The earth is oval, the moon revolves around the sun, and earth and moon revolve around the sun many times during a year. The distance of remote objects can be told at once and with accuracy. And more to similar effect.

And modern astronomy is not by any means so dead certain about things as it might be. Those stupid ancients put the sun and moon among the seven planets, "because they did not know of Uranus and Neptune." But they may have had other reasons. STUDENT

Modern Bathroom in "Abraham's Time"

MINOAN art is startlingly modern, and there are few scholars philosophic enough not to receive a series of shocks when they see a scientific drainage and lavatory system and magnificent staircases assigned to a date which is nearer the Third than the First Millennium before our era.—*The Discoveries in Crete*, Burrows, p. 104.

Advantage was taken, too, of the steep gradient to develop an elaborate drainage system in the private rooms . . . with an arrangement of lavatories, sinks, and manholes, that is staggeringly modern and "all Inglesse," as Dr. Halbherr gracefully calls it.—*Ib.* p. 8.

. . . PEOPLE were amazed to hear of a bath-room at Cnossus dating from the time of Abraham (1800 B.C.), "with all the latest improvements." . . . Patient research may yet establish the astounding fact that there were human beings in existence before the dawn of the nineteenth century who were neither liars nor imbeciles.—*T. P.'s Weekly*

The Trend of Twentieth Century Science

Active and Passive Sight

SOME years ago Nikola Tesla opened up a line of thought which might have led to some physiological work that would also have been philosophical.

The soul, he suggested, shows itself in the eye. The suggestion rested in part upon this argument:

It can be taken as a fact, which the theory of the action of the eye implies, that, for each external impression, that is, for each image produced upon the retina, the ends of the visual nerves, concerned in the conveyance of the impression to the mind, must be under a peculiar stress or in a vibratory state.

When the will calls up from memory an image of something once seen and stored there, the reverse, he suggested, must take place; there is a regeneration — now, however, from *within* — of the "peculiar stress" or "vibratory state" of the ends of the nerves; from this the retina takes on, faintly, the original picture; and this *leaves* the eye as light, just as, previously, it *entered* it as light.

Helmholtz has shown that the fundi of the eye are themselves luminous, and he was able to *see*, in total darkness, the movement of his arm by the light of his own eyes. This is one of the most remarkable experiments in the history of science, and probably only a few men could satisfactorily repeat it, for it is very likely that the luminosity of the eyes is associated with uncommon activity of the brain and great imaginative power. It is fluorescence of brain action as it were.

Then he notes, which he thinks others must also have noted, that

when a sudden idea or image presents itself to the intellect, there is a distinct and sometimes painful sensation of luminosity produced in the eye, observable even in broad daylight.

It will probably be found that vision is an exceedingly complicated, double, and oscillating process; excitation of the organ by light from the object looked at, rapidly alternating with its return excitation into a luminous static-electric state by a positive action or radiation from the mind. And of the oscillating pair, the reaction may be infinitely more complicated than the action. As psychology knows, the interaction of object and subject is necessary for concept. Organisms very low down the scale, and inorganic units, *perceive* what we do: that is, the light falls upon them and effects all sorts of changes; but they do not *conceive* because there is either little or no contributive and alternating reaction from the mind. The electro-static reply state is lacking.

STUDENT

The Archeus

THE Archeus, the vital and intelligent force in nature, is in these latter days venturing to raise its diminished head again, and now not so very apologetically. In the columns of a popular contemporary, Dr. Russel Wallace, writing on the phenomena of evolution and heredity, says:

Every attempt to explain these phenomena — even Darwin's highly complex and difficult theory of Pangenesis — utterly breaks down; so that now, even the extreme monists, such as Haeckel, are driven to the supposition that every ultimate cell is a conscious, intelligent individual, that knows where to go and what to do, goes there and does it!

These unavailing efforts to explain the inexplicable,

whether in the details of any one living thing, or in the origin of life itself, seems to me to lead us to the irresistible conclusion that beyond and above all terrestrial agencies there is some great source of energy and guidance, which in unknown ways pervades every form of organized life, and of which we ourselves are the ultimate and fore-ordained outcome.

Botany, in the person of Professor Henslow, is saying the same thing, ascribing to plants an intelligent share in their own evolution, crediting them with memory, with the power of adapting themselves to new situations, and of handing on the adaptation. Professor Darwin recently took the same ground. Variations are not at haphazard, but tend in the direction of a specific object; and the intelligence prompting their appearance — whether we ascribe that to the living thing, which is rather difficult, or to an all-pervasive Archeus — learns and progresses by the experimental attempts.

The latter ascription is made by the 1909 Hunterian lecturer, Dr. William Wright, surgeon and lecturer on anatomy to the London Hospital Medical College. Speaking of Lamarck's theory — that, for example, the giraffe lengthened his own neck — he says:

The theory has the distinction of being the earliest and has the merit of recognizing in nature a power which is capable of effecting adaptive variations. The error probably lies in the unnecessary and improbable assumption that the animal itself controls this power.

Then he considers Wallace's view:

According to Wallace's interpretation variation must be regarded as due to the mysterious powers of life. If such be so — and I see no possible alternative — it then becomes a question whether the origin of species itself should not be ascribed to these same powers, the part which natural selection plays being of quite secondary and almost insignificant importance.

Perhaps no region of the body can so well furnish evidence of variation adapted to purpose as can the skull. We find in it the most admirable and ingenious devices — devices distributed with a lavish and equal hand through all classes of the zoological kingdom, devices which in the vast majority of instances create wonder and disarm criticism. This being so, it seems to me singularly illogical to attribute them to that chance which is properly represented as blind helped though it be to the utmost by the pruning process of natural selection. . . . Again, the manner in which many amphibia can regenerate amputated limbs indicates the existence in these animals of a creative and intelligent force of which they can be only dimly conscious. . . .

If we are thus compelled to recognize a mysterious force as the *vera causa* of evolution, are we wise in endeavoring to conduct our inquiry further? For my own part, I have no hesitation in answering in the affirmative, for the question becomes psychological and the psychological is intelligible. I hold with Descartes that "we know more of mind than we know of body, the immaterial world is a firmer reality than the material."

As to the way in which this force works little is at present known. The most interesting feature about it is that if it does not exhibit an intelligence which is human in its nature, it acts in a way which the human intellect can follow and in some measure comprehend. I have already said that it appears itself to be undergoing an evolutionary process; the only alternative is to suppose that it finds difficulty with the material in which it works.

Then he passes on to a suggestion concerning extinct types, each of which, he thinks, lent its momentary services to the great plan:

One of the most impressive facts which presents itself to a student of evolution is the enormous number of extinct animals, the apparently large and useless waste of animal forms. The explanation may be, however, that each of these animals has evolved to a marked degree some particular and apparently insignificant attribute, and that after such development Nature is able by combination of these separately evolved attributes to effect some important and remote variation. If this were the case, we could understand the reason for the presence of such animals as the dinosaurs, whose large and strange bones are from time to time recovered from the bowels of the insatiate earth.

But at the end of his lecture he begins to fail, apparently thinking that with the production of present man the long program reaches its finality.

It is impossible to imagine man better adapted physically for the position which he has been called upon to fill. Morally our knowledge of what is right cannot undergo any higher development; we can only advance by bringing more into harmony, practice and precept. Nor do I think that mentally we are likely to improve; we will, no doubt, accumulate more facts, recognize, name, and even direct forces in nature of which we are at present ignorant, but whether we will pierce more the mystery of things, whether a human intellect will ever surpass that of Aristotle is a matter upon which I remain sceptical.

This view has of course to take rank with that of the old stage-coachers who were quite sure that invention would never give us a faster locomotion than ten miles an hour. For animal and plant consciousness, buoyed on and guided by the great tides of nature life, nature consciousness, cannot dive into its source and directly learn the whole. But man's *self*-consciousness does enable him to do exactly that, if he will but develop his inner life sufficiently. Man is the highest thing in the way of a sentient animal that nature, the Archeus, can make. But as an added crown to all that she has done, he receives — from another point of view is — a self-conscious soul, the spectator of the whole subjectivity of his animal. If you count him as an animal, he *has* a soul — a somewhat perplexing philosophical position; but better and more truly, he *is* a soul incarnate in the highest bit of nature's work. Coming to *full* self-consciousness, as soon as he does so, he will be able to guide the nature life to much higher expression in his physical instrument. STUDENT

Utilizing Skin-Respiration

THE method, devised by a German physician of operating on the lungs without danger of their collapse, by reducing the surrounding air-pressure, has suggested something else. The operation is done in a partially exhausted cabinet, the patient's head protruding through a rubber-collared hole in one wall.

The suggestion is that the same apparatus, but without the exhaustion, might be used to charge the blood with a volatile aromatic antiseptic such as camphor. The patient would be breathing pure air whilst the respiratory gas-absorbing power of the skin would be used to compel it to take in the antiseptic vapor. It is possible that enough could be administered at least to hamper the work of germs in the blood, if not altogether to stop it. STUDENT

A World Congress on Conservation

A "DECLARATION of Principles," issued by the North American Conservation Congress and signed by representatives of the United States, Canada, Mexico and Newfoundland, agrees that no nation acting alone can conserve resources and that consequently united action is necessary. These resources are all materials available for the use of man as means of life and welfare: those below the surface, like minerals; those on the surface, like soil and water; and those above, like forests. It is man's duty, and also his right, to develop and perpetuate these resources and to guard against monopoly.

As regards public health, pollution of waters should be prevented.

As regards forests, many and large reservations should be made and kept under government control; instruction in forestry should be given; taxation on timber and land should be so adjusted as to encourage the preservation of standing timber; forest lands in important sites should be protected in the interests of the public, whether under public or private ownership; fire must be guarded against; and the preservation both of the timber itself and of the land which it protects is to be held in view.

There are similar resolutions regarding waters, minerals and game; and the Declaration concludes with a proposal for a World Conservation Congress. The North American Conference suggests to the President of the United States that all nations should be invited to join in conference on the subject of world resources and their inventory, conservation and wise utilization. T.

A Vain (?) Peacock

A LETTER sent to the *London Spectator* relates the following account of a peacock. It used to frequent the stable yard in order to look at its reflection in the polished panels of the carriage. Then he took to following the carriage up to the house and continuing his self-contemplation at the front door. Next he took to following it down the drive. Then they tried him with a looking-glass, and this gave him great pleasure. At first he would peep behind it to see if there was another bird; but he soon gave this up and, whenever the glass was brought out, he would spend his whole time contemplating himself, refusing to notice either food or his sitting mate. This anecdote is given as justifying the familiar phrase, "vain as a peacock."

It is by no means easy, however, to tell what was the bird's attitude of mind. He is described as standing motionless, occasionally moving his head up and down, and sometimes softly touching the glass with his bill, appearing bewildered by the contact. In any case it is obviously not the same thing for a peacock to behave like a peacock as it would be for a man to behave like a peacock. In the man, such behavior would mean vanity; therefore in the peacock it cannot mean vanity in the same sense. So we should be careful how we attribute to animals our own failings. It may even be that what would be a vice in a man is a virtue in an animal; it all depends on the state of mind and whether the creature performing the act is progressing thereby or retrogressing. In a man such an indulgence of vanity would be a retrograde step; but what the action described might have signified for the peacock, who can say? He was certainly learning. E.

Unexplored Parts of the World

THIS year are to start expeditions to explore several hitherto unvisited parts of the earth. It is hoped to be able to cross that vast unknown and most forbidding desert in Arabia, between Aden and Muscat. We are apt to underestimate the size of a country which, like Arabia, has so few details filled in on the map. It is like the so-

called "simple" structures in science, such as the gases, which contain so little that we can see; it would be more accurate to say that we see so little that they contain. A table of areas gives Arabia 845,000 square miles. The areas of all the Southern States add up to 790,865; the areas of Spain, France, Germany and Austria-Hungary add up to 851,495. In Central Asia there is much exploration to be done, and Dr. Stein is about to start on another expedition. The penetration of Dutch New Guinea by Einar Mikkelsen, an Arctic explorer, is to be undertaken. The interior is absolutely unknown. In South America about two million square miles remain unexplored. And finally there are the two Polar regions, to which various expeditions are continually going. H.

The Boll-Weevil

THE boll-weevil has been known to make a steady conquering advance of ten miles in a season, to cross bodies of water ten miles in breadth, and to skip over 40 miles of country that does not grow cotton. It first appeared in Texas about 16 years ago, and has since infected Louisiana, Oklahoma, Arkansas, and Mississippi. In a single season a pair can multiply into over twelve millions, and it can change its habits to suit the climate. It occupies one-sixth of the area under cotton, and it is predicted that in from 15 to 18 years it will occupy all.

FREEDOM

ONCE I wished I might rehearse
 Freedom's paean in my verse,
 That the slave who caught the strain
 Should throb until he snapped his chain,
 But the Spirit said, "Not so;
 Speak it not, or speak it low;
 Name not lightly to be said,
 Gift too precious to be prayed,
 Passion not to be expressed
 But by heaving of the breast:
 Yet,—wouldst thou the mountain find
 Where this deity is enshrined,
 Who gives to seas and sunset skies
 Their unspent beauty of surprise,
 And, when it lists him, waken can
 Brute or savage into man;
 Or, if in thy heart he shine,
 Blends the starry fates with thine,
 Draws angels nigh to dwell with thee,
 And makes thy thoughts archangels be;
 Freedom's secret wilt thou know?—
 Counsel not with flesh and blood;
 Loiter not for cloak or food;
 Right thou feelest, rush to do."

Emerson

The Advantages of Thoroughness

THE claim made by Theosophy that it presents a picture of the life of man and nature which is truth itself, places its study in a position which differs from any other system of thought or philosophy. The student of Theosophy is in search of truth, and of nothing else. The fancies, theories, or speculations of this or any other age are but stepping-stones to the one great ideal.

In this pursuit the student of Theosophy has a great advantage. Believing that he himself is in essence potentially possessed with the power of discrete discernment, he will accept nothing blindly from any authority who he has not the best reason to know (from the exercise of that same discernment), is further advanced on the same road on which he is traveling. He expects someday to be where they are, though he may have to wait long for it. He recognizes that he has not yet attained to a great ideal which he can nevertheless see foreshadowed in imperishable lines upon the screen of time. He knows with a conviction which nothing can undermine, that the very same wisdom to which he and his fellows will some day attain in its fulness, is even now throwing a light upon his pathway.

It becomes at once evident that to keep this pathway is worth every effort which he can make. Doubt, nervousness, fear, attempted estimation of relative progress, are out of place. There is always at least one step to be taken about which there can be little or no mistake. The rest will follow in due season.

One quality is of essential value in this progress, and its cultivation is worthy of every effort. When once perceived and constantly dwelt upon in the mind, its importance is immediately recognized, and its growth be-

comes natural and self-productive. This quality is what we may term *thoroughness*. In some Theosophical works it is called Concentration.

The quality of thoroughness is essential to true progress in every department of human life. Every man, woman, or child who possesses it, is recognized by the world at large as differing from his fellows to the degree in which he has attained it. In business or politics or social life, the man who has the courage of his convictions is esteemed, whether he be judged wrong or right. From the man who cleans shoes to the President of a great Republic, from the laundress who washes linen to the directress of a ladies' college, from the child who plays in the gutter to the college student, every one who has nerve and courage and effectiveness receives the esteem of men.

And on the plane of moral guidance also this quality of thoroughness possesses its own essential potentiality of redemption. The Apostle Paul denounces in the strongest terms those who "blow neither cold nor hot." The transgressor who knows no better, and who dares to do wrong because he sees no reason why he should not, is sometimes nearer the truth than the half-hearted man who is proud of his cowardly virtue. For when the wrongdoer has learned by the Law the error of his ways, the power of his innate thoroughness will lead him to the truth. "The greater the sinner, the greater the saint," is an old proverb and has much truth in it, though not to be taken in any sense as an excuse for wrongdoing. "Truth," says Bacon, "emerges sooner from error, than from confusion."

The quality of thoroughness leads us to a right discrimination of the state of inner feeling, which we may encourage or discourage within ourselves.

Let us take discontent for example. Suppose I am discontented with my daily lot in life, and go about my duty with this heavy iron weight oppressing my inner being. Would this feeling disappear if I did some other thing which my capricious fancy presents as the thing I should like to *do* or *be*? Not at all. Make the change, and the result would be just the same. I should carry my discontent with me, and should soon fancy another change desirable. And I should soon find out, if I examined the question boldly, that the discontent and not the surrounding condition was the cause of the trouble.

But how to get rid of the discontent? Let me follow some such line of thought as this. Who set in motion the causes which led you to be where you are? Did you not do this yourself? What guided these causes to produce the present effect? Was it not the all-wise and merciful higher law of mercy and justice? What do you want to change for? Are you doing properly and thoroughly what the good law has provided for you, that you may learn your lesson from it? Be assured that you must do this before you can pass on; because even if you should unwisely force your way from your surroundings, before your duty in your present post of trial was performed, you would only produce a greater discontent, the suffering of which would lead you back to where you now are, so that you might try again.

For the ordering of your life is in the hands of a law outside your consciousness, but whose

action may be clearly seen and recognized. And the next experiences you may have, when you have passed through your present probation, are such as you have not hitherto realized, or they would not be worth the having.

All experience of human life shows that a man-sought vesture for the sake of a vesture of outer seeming, ends in inevitable disappointment. The man who desires some position amongst his fellows other than the one in which he finds himself, does not stop to consider that the change would also affect every other person with whom he is associated, and that they also are protected and guided by the higher law. The selfish pursuit of personal ends must surely retard the true advancement of both one's self and others. For the Theosophist the latter becomes a matter of the utmost importance.

The study of all history, from that of the family to that of the nation, reveals unmistakably the fact that the events of life which are worth while come as the result of an inner impersonal unselfish human character, which each one may develop by making use of those opportunities provided by the law, that come to all to benefit his fellows. The outer appearance in which this opportunity is clothed is ever unsought by him who is worthy to fill it.

The trinity of body, mind, and soul, of which man is made up, deserves attention from every point of view. An all round and thorough attention to the proper and suitable development of man as a whole, is worthy of every student of Theosophy. *Mens sana in corpore sano*, a healthy mind in a healthy body, is the foundation of that instrument which the soul can use to fulfil its perfect work. And here again thoroughness is necessary. A body which is carefully guided into habits of abstemiousness, cleanliness, alertness, and punctuality; and a mind which is a trained servant, and not an unruly master, are not easily attained. The inner man who should guide and use these two instruments requires to have them thoroughly in hand.

If we begin to recognize this, and also that we have not attained to our great ideal in regard to it, we may also see for our encouragement, that at least there is a path before us which we may carefully pursue; and if discouragement take possession of our souls let us thoroughly investigate the cause of the dismay.

And then we shall find in every case that personal ends and status have been the center of the conscious cyclone—or of the cloudy and iron days—of a subtle weariness and discontent. For a time the thorough conviction of the strength and peace of our own souls has left us. We have moved from the center of the revolving wheel of life, and wandered amongst personal questions which amounted to nothing and ended nowhere.

For there is a thoroughness of realization of the inner man, in the heart of his life, which leads to an utter disregard of the illusion of personal stature. It is a knowledge beyond thought, which reveals our indestructible partnership in the Eternal. In that we may rest in peace, with the full assurance that whilst we outwardly strive to do our whole duty, we are inwardly guarded and provided for in every detail and may advance not only without doubt or fear but with strength and joy and ever increasing confidence.

STUDENT

"WHEN I AM WORTHY OF MYSELF"

DUST as we are, the immortal spirit grows
Like harmony in music; there is a dark
Inscrutable workmanship that reconciles
Discordant elements, makes them cling together
In one society. How strange, that all
The terrors, pains, and early miseries,
Regrets, vexations, lassitudes interfused
Within my mind, should e'er have borne a part
And that a needful part, in making up
The calm existence that is mine when I
Am worthy of myself.

William Wordsworth

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question What, according to Theosophy, is the true purpose of life if it be not the development of self, and through it of the race?

Answer Nothing: but there is such an outrageous gloss to be put on this—and so many will beyond doubt, put it—that one would almost rather hunt for any answer in the world than admit the truth of the question as it stands. Let us say then, that the true purpose of life is *not* the development of self; is *NOT* the development of self; is most certainly and emphatically *NOT* the development of self. The only development possible or desirable or wholesome, is to leave self right out of account, forget it, drop it altogether, and go on to something else.

There is a class of people nowadays who go in largely for the development of self; and we make no doubt that if you were to ask them, they would say that the race was being gloriously developed by them while going through their antics with the breath, gazing at the ends of their noses, hypnotizing their friends, airing their "personal magnetism" on society, and so forth. It is bad enough when self is there in its stronghold, and you have not taken any pains to develop it. When a man is in business and just fighting hard for his own hand and what money he can get, and "devil take the hindmost"—such a man as that is just in the run of humanity; making the Karma of the race a little heavier, it is true, and earning nothing good for himself; but the Law will break through his hard shell in time, and as humanity advances, he, through the proper amount of pain, will advance too. He has not picked up his chattels and deliberately marched from the track, camped away off the roadside, and sniped at stragglers for a living.

Self is a great mystery, a thing of infinite and subtle machinery; man is at once paradise, purgatory, and hell. If there is anything sacred in the universe, it is he; rather, you shall not come upon any sacred or marvelous thing except through the portals of self. So, too, it is true that wickedness did enter into the world through man; the cunning serpent is within him, and all the seven regions of the damned. Were it not for the poisonous emanations of our minds, there would be no evil thing in this world. Our cruelty, in all likelihood, has endowed even nature with her red teeth and claws. Each one of us, for instance, might lift his lot higher than the angels', or sink it lower than anyone's whom Dante saw in the first of his supernatural journeyings.

There are seeds within us of immortality and glorious service, and seeds of infinite ruin and misery and decay. And these seeds have no label on them in any language that can be read by him who runs. Let a man take up any self-developing pranks, and in the natural order of things he will be planting and manuring and watering the seeds only of hell; because the ordinary nature of us is tinged with selfishness, and selfishness is the gate of hell. There are two roads that a man may follow, marked respectively *selfishness* and *altruism*, and we are nearly all of us just dawdling on the opening of the former road. For God's sake, come right out of that, and make some headway along the other, ere it be too late.

It is a real and vast peril, however little it may be accounted. Some day we are all to find out that it is not the opinion of men, nor outward success, nor how we flash and figure in the world that counts, but what of service we stand ready to do. The race is not developed, nor anyone profited, by your being a great scholar or artist or engineer *if you are these things for your own sake* and remain indifferent to humanity; and along the path of these developers you do not long remain even indifferent; you very quickly become hostile, because the whole struggle is daily becoming more acute; consciousness too, and desire, are becoming more acute. That you shall succeed in the most plenary sense, has become a perpetual itch, longing, and necessity with you, and the success of everybody threatens your own. At all costs you must have no superior; to be excelled by anyone would be the equivalent of death. So that you are pitted against others, and all others, and hurrying forces from all the unknown fields of your being for an active warfare against humanity. That is the goal undoubtedly, even if distant. The wiser you are, the cleverer you are, the more developed you are, the worse; the worse for yourself and for the world; because there is a limit, and nature will not be stretched from her purposes for ever. You have made headway off the road, and over barren and jagged rock-land. Irresistible forces will at last drag you bleeding back, to brutish dullness and the lack of all power and ornament.

It is only when self-development has come to mean the development of unselfishness and the will to do service that it can be called the object of life. For the main fact about self is one that we have no practical knowledge of; that is, its duality. On the surface even, this duality appears; the things commonly called "good" and "evil" are the first manifestations of it. In reality we have not trained ourselves to have more than the crudest notion of these. We say a man is good, when he does not offend, to our knowledge, against our general and conventional code. In reality he begins to live the higher kind of life when he becomes convinced that his life ought to be lived for the sake of humanity, and he sets his will to make it so. Even your virtues are no real asset, when cherished for your own sake. "To live to benefit mankind is the first step," and woe unto him who places it second or third, or relegates it to the far distance, content to develop self now, and jump whatever may be to come.

Also: "Seek ye first the kingdom of God, and all these things shall be added unto you." There is a power of truth in that; for the

kingdom of God, which is no external or post-mortem affair, but within us, and to be made manifest, by us, here on earth, is nothing but the higher life, the life of the soul, which is universal and not confined by the limitations of self. We must develop that soul-life, then, to the utmost of our power; and the one and only way to do it is by doing all our duties "as unto the Lord"; the unwearying service of the Divine Self of the world. STUDENT

Question According to Theosophy, what relation does the human kingdom hold to the animal?

Answer For thousands of years man has claimed absolute mastery over the whole brute creation, mastery at least so far as his rights were concerned. He has taken the stand that being himself the highest product of evolution, the rest of creation is for his sole benefit and to be dealt with exactly as he may see fit. He has looked upon it from an entirely selfish standpoint, and has valued the different animals entirely according to the use they would be to him—use, living or dead. For man has claimed the right over their life and death, and while he has trained some domestic animals to act as bearers of burdens for him, the vast majority he simply kills so as to make use of their flesh or hide.

Man is the master, man has the power over the animal kingdom, it is entirely under his control. Man is the highest exponent of life on this globe; in man alone has the divine spark of thinking self-consciousness incarnated. So much more reason then for man to use his power and his faculties so that they may redound to the benefit of the rest of creation. For man has duties as well as rights, very real duties, more real than the rights which are only fanciful and self-asserted. With every power conferred comes a corresponding duty, and if man is the wisest being now on earth, surely he is in duty bound to use that wisdom so as to help to uplift those who have not yet attained to the same exalted stage of evolution.

At present man blames the animal world for many faults which may be the very result of his own treatment, and which faults very often are only a reflection of the same or even worse faults in man himself.

The universe is one and undivided, and each unit is in a sense responsible for the whole. If man will only look carefully into his own nature he will find there much that pertains to the animal rather than to the human. It *should* be there, so it is as well so far, but it should be controlled and be brought into harmony with the divine and be ruled by it. Sooner or later man must acquire such self-mastery that his higher nature will always maintain complete control of the animal within, and then, and not till then, will he also begin to realize his true position in relation to the animal kingdom. E. T. S.

For real Theosophy is Altruism and we cannot repeat it too often. It is brotherly love, mutual help, unswerving devotion to Truth. If once men do but realize that in these alone can true happiness be found, and never in wealth, possession, or any selfish gratification, then the dark clouds will roll away, and a new humanity will be born on earth.

H. P. Blavatsky

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

Persistent Types

IT has often been remarked that we may too easily look upon the people of ancient times as differing from us in character and surroundings to a greater degree than the truth would warrant. Possibly if we were to go back to the times of ancient Egypt, or the golden age of the Aryan races, essential differences might exist, and certainly the comparison would not be to the advantage of recent times. But everything tends to show that for thousands of years human characteristics have been very much as they are today. A recent writer, who has given deep study to the question, has even advanced the opinion that the ancient Romans, whilst very unlike the people of modern Italy, were very similar to the English of the 19th century, in character, general culture, and even physical appearance.

One of the writers of ancient Greece who is little known and studied, is Theophrastus. He lived in the 3rd century B. C., and wrote many books on botany, physics, and metaphysics. He came to Athens from Lesbos and was the favorite pupil and appointed successor of Aristotle, who bequeathed to him his library and the originals of his own works.

The best known work of Theophrastus is his *Characters*. He has portrayed the failings of humanity in a series of sketches which are both amusing and instructive. Here are two:

The Surly Man is one who, when asked where So and So is, will say, "Don't bother me"; or when spoken to, will not reply. He cannot forgive a person who has besmirched him by accident, or pushed him, or trodden upon his foot. When he stumbles in the street he is apt to swear at the stone. He will not endure to wait long for anyone, nor will he consent to sing or to recite, or to dance. He is apt also not to pray to the gods.

The Loquacious Man is one who will say to those whom he meets, if they speak a word to him, that they are quite wrong, and that he knows all about it, and that if they will listen to him, they will learn; then, while one is answering him, he will put in, "Do you tell me so?" or "Thanks for reminding me"; or "How much one gets from a little talk to be sure"; or "By the bye"; or "I have been watching you all along too see if you would come to the same conclusion as I did"; and other such cues will he make for himself, so that his victim has not even breathing time. Aye and when he has prostrated a few lonely stragglers, he is apt to march next upon large compact bodies, and to rout them in the midst of their occupations. When people say they are going, he loves to escort them, and to see them safe into their houses.

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

Surely these are types of people whom we all have met more than 2000 years after they were so well described by Theophrastus. Analysed by the light of Theosophy they are instances of persons who are so wrapped up in their selfish personality that they have but little regard for the feelings of others. Possibly they may be regarded as extreme, but they will serve a good purpose if their study should lead to the avoidance of even "the appearance of evil."

STUDENT

Milton's Hero Satan

A CORRESPONDENT in a literary paper points out that the real hero of Milton's *Paradise Lost* is Satan.

Only a minor poet would have attempted to make a hero out of Adam. Milton saw that he could not make a weakling the hero of his epic. It is true that he chose the rebel; but a rebel may do heroic deeds. Milton saw that our erring parent was a contemptible creature when compared with Satan. The fall of Satan was sublime, that of Adam was mean. . . . Yes; undoubtedly, Lucifer is the hero of *Paradise Lost*.

Milton was in a dilemma between his intuitions and the theological necessities by which he deemed himself bound. The conventional Satan is an invention of old theology, whereby Lucifer the *Light-bringer*, the Morning Star, was converted into an evil being or personification of the evil in man's nature. In reality the two are entirely distinct; for Lucifer represents the free intelligence of Man, by which he redeems himself. It is false teaching that has chosen to confound this with the evil, thus leading man to distrust his own Divine powers and oftentimes to condemn knowledge as sinful.

Milton felt the truth of the original teaching as to Lucifer, and made him a hero whose dauntless resolution all must admire. But, owing to the confusion between Lucifer and the theological Satan, Milton seems to be glorifying an evil being.

It is among the missions of Theosophy to dispel the false teachings which lead man to

slight his Divine gifts of free-will and intelligence and which cause him to oppose religion to science; and in fulfilment of that mission Theosophy has to expose the perversions which many ancient symbols have undergone to make them fit the false teaching. The subject is adequately treated in *The Secret Doctrine*.
STUDENT

Jesus' Birthday

DECEMBER 25th was not celebrated by the Christian Church as the birthday of Jesus until 353 or 354 A. D., says Professor George Rietschal in the *New York World*. The early Christians merely observed the Jewish feasts, and Sunday as the day of resurrection; from which it followed that the Sunday after the Passover was considered as the anniversary of the resurrection. There is nothing to indicate the day of Jesus' birth, and various attempts were made to calculate it. In 221 Sextus Julius Africanus fixed December 25th, and Hippolyte settled on the same date. Pope Julius I (337 — 352) established by special acts that December 25th be the birthday, and January 6th the baptismal day. When Christianity was adopted by other nations, a number of different "pagan" observances became mingled with it, especially those referring to the celebration of the winter solstice. T.

Capital Punishment---Christian?

A CHRISTIAN publication in North Carolina advocates hanging. To quote:

Apart from the gospel, nothing would work more for the salvation of the country than a goodly number of well-conducted, well-considered, and well-timed hangings. . . . We believe in capital punishment because we believe in the Bible.

But if crime is increasing, may it not be partly the fault of the churches which insist on remaining ignorant of the true nature of man? The passages in the Old Testament supposed to support capital punishment are either, on the one hand, the record of tribal ignorance, or on the other, and mostly so, perverted or misunderstood statements of a simple Karmic law which impersonally decrees that in the long run, in some incarnation on earth, he who has used violence will himself suffer it. The Nazar Teacher never suggested that we should take the law of retribution into our own hands. We can restrain, and help, wrong-doers; but no true World-Teacher ever said we should kill them. J.

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

AT Isis Theater last Sunday evening, Professor H. T. Edge gave a most interesting and instructive address on the Significance of Easter; there were special decorations appropriate to this most beautiful festival of the rebirth and resurrection of Nature, and a fine music program was rendered by the Râja Yoga Sextet.

Professor Edge in his opening remarks referred to the fact that the name "Easter" is a survival from the old Teutonic mythology. This, he said, may serve to remind us of the extremely patchwork nature of the accepted religion, which contains elements from ancient Hebraism, Greco-Roman mythology, Scandinavian mythology, and many other sources belonging to an archaic past.

actually tells us. The Resurrection, therefore, means the resurrection of man, of the Divine in Man, the real Man.

The other point we had to consider was Easter as a universal rite, celebrating the birth of the year at the spring equinox. This is the symbol of rebirth and regeneration — one of the Laws of Nature. It reminds us of the fact of Reincarnation.

Let us then try to regard this Easter Day as something more than a mere celebration of the alleged rising of Jesus Christ from the tomb. Let us look upon it as symbolizing the resurrection of our own Spiritual Life from the tomb in which we have immured it. Let us look upon it as a revival of hope and faith in the eternal power of Right. Let us hail it as the emblem of the birth of a new solidarity in humanity, based on the common recognition of the Soul-life.

OBSERVER

have called down a plague on a town in Oklahoma by praying for a six months' drought. Since then, scarcely a drop of rain fell until the day when the minister prayed for the drought to end. He had had a dispute about money with a lumber firm, and determined to paralyze their business until they gave in. As a result hundreds of men moved their families in actual want to other parts of the state. Then the minister prayed for enough rain to enable the mills to resume operations for a week. Rain came and the mills started, but drought set in again after the week. But the mill managers still refused to believe that they could secure rain by acceding to the minister's wishes. In his farewell sermon the minister told the congregation that he would pray for rain as soon as he crossed the river into another county, and three hours after he had left the place, the heaviest rain in more than

A CURIOUS BOULDER — GOTHLAND, SWEDEN

In connexion with Easter there are many quaint customs, such as the giving of eggs, lifting or heaving, burning tapers, etc., the remains of old rituals and popular traditions. The Egg is a very ancient and universal symbol, found in all the great cosmogonies. It is in the Hindû sacred books, in the Scandinavian mythology, in the Chinese legends and among the ancient Americans. It is a symbol of the generative life from which the Universe sprang. The churches accepted this symbol, as they adopted so many others, and tacked it on to the celebration of Jesus' "resurrection."

In connexion with this subject there are two points to consider: one is the resurrection of Christ, and the other is the rebirth of the year and regeneration in general. Many clergymen are now teaching that the vital fact in christianity is the fact of our own Divinity, as is taught in Theosophy — the fact that we must find our salvation by the Light within, as indeed Jesus himself, according to the Bible,

Praying for Drought

A PROMINENT object of the CENTURY PATH is to illustrate Theosophical teachings by a review of current events and opinions. The following is an illustration of what H. P. Blavatsky says about prayer in *The Key to Theosophy*. Prayer, she maintains, is an invocation of some power in ourselves, which power may be either the Divinity in us or merely the latent energies of selfish desire. In the latter case the praying is simply a form of black magic, since it consists in evoking latent energies for the purpose of accomplishing some personal wish regardless of its rectitude in the light of the Higher Law. If the truth of this statement is not sufficiently obvious in ordinary cases, it can be made so by referring to an extreme case, and the following will serve this purpose; it illustrates the point, even if there is error and exaggeration in the account.

A reverend "holiness" preacher is stated to

twelve months descended upon the thirsty land.

It is by no means impossible that a man should possess the power to influence the elements; the beliefs and traditions of ancient peoples unanimously support this possibility. But, whether the rains and droughts were due to the minister's prayers or not, the fact remains that he used his will, as also the further fact that many people believe that he succeeded.

Will not everybody admit that such a praying was an act such as can under no circumstances be justified or tolerated? It only remains to extend the principle to the minor and more ordinary cases. How many of us who pray can say that our prayers are wholly unselfish? And even if they be what we should call unselfish, they may still be conceived in such narrowness and ignorance as to constitute them but little better. He who presumes to pray for a definite thing limits the purport of his prayer by his own inadequate concep-

tions of what is right and thus interferes with the just working of the Law. The only true prayer is an unselfish aspiration to acquiesce in the Law, and an ardent desire that we may become a focus for the powers of good to work through. Anything short of this causes our prayers to become tinged with inferior motives and to partake more or less of the nature of black magic.

And in congregational praying we have the same thing on a larger scale; as where one nation prays for victory over another or for its own harvests to be blessed. Even if we do not condemn such prayers, let us at all events recognize them for what they are — incantations such as any savage tribe might perform, invocations of power resident in the collective will of the community, for the purpose of actuating the invisible springs of Nature. In this case, each community has its own god.

Fortunately the selfish or ignorant prayers of most people are ineffectual because they are not sufficiently constant in their desires or do not know how to concentrate their forces. But still prayers must exert quite an influence in shaping people's lives in many cases. Probably the effect of the accumulated desire does not come off until after the person has ceased to desire it, and by that time he is praying for something else.

If people in general ever get to be aware of the power of thoughts when properly directed and concentrated, we shall have a battle royal of contending wills; and it was to prepare to save in some such contingency that Theosophy was promulgated. Theosophy requires of its students such moral safeguards and instruction in the laws of life as will prevent them from abusing their powers to the detriment of people.

H. T. E.

"Conscience Doth Make Cowards of"— Some

FROM time to time the Exchequer publishes its official receipts of "conscience money." We read them with a slightly amused interest, not seeing some underlying tragedies of soul. Not all are that; some merely represent awakened honesty, which quietly pays a debt.

But some of the rest represent an attempted propitiation of deadly fear, the fear that Lytton pictured as the "Dweller on the Threshold." As soon as a man tries to awaken himself spiritually and travel along the path that leads to the light, along with other parts of his consciousness he unwittingly stirs up memory. And one day when he is most serene, the memories of acts he has long forgotten and would fain keep forgotten, move in upon him like shadows. Each introduces some more and presently his brain is black with them and his heart chilled like a stone. It may not be money; there may be no possibility of reparation.

His will is now gone in fear, even terror; faults that he had nearly surmounted may come back in all their strength; he feels, among his fellows, like some guilty thing that dare not look them in the face.

Some commit suicide, thinking to escape that way. But they have only gone into a dim world where there is nothing but those phantom memories and no consciousness but terror; no sunlight, no companion to break the silence. And there they stay until the hour

which would have been their natural release from flesh.

Some try debauchery or sociality — fruitlessly, even if they go so to their very death. For the phantoms are the other side of death for them.

Some wait and suffer for days or weeks, dumbly, until the hour of that cycle of consciousness is over; and then go on again, knowing that the foe is only resting awhile, but hoping by the time that he wakes again to be somehow ahead of his reach.

And some confess, get a penance prescribed, and a "restful" absolution. The horizon is clear again, and now they know the way to clear it as often as it shall darken.

Every man who is sincerely trying has evoked in himself the light of the Heart of the universe; it is within and about him. Why should he ever think it his duty to look away from that — at phantoms? Why should he ever think it his duty to let a memory come between? Why does he ever let terror replace that joy which the light steadfastly offers to those who are trying in this NOW to live their

WHEN a man sorrows in heart, and grieves the death of a loved one,
Then if a minstrel arise, or one that delighteth in music,
Singing the glorious deeds of men that lived aforetime,
And of the happy gods that dwell on the Mount of Olympus —
Then he forgets his sorrow, and remembers no more his affliction,
And his soul is turned aside to enjoy the gifts of the Muses.

Hesiod, *Theogony*, ll. 97-103

best? The light never prompted that; its message is always, Come; throw away brooding; Come.

The man that sinned in the past has now, by looking toward the light, by trying, *othered* himself; he lets the past take care of itself, until, in the light, it can be calmly looked at and learned from. Nor will he seek the light in fear, as escape; it is the *right* of the man who wills; in so willing to try, he establishes for the first time his real manhood. He is gaining the power to help rather than cringing for protection. The attitude is to disregard, not flee from, the past; to deny its pretension to dominate. It is really galvanized into a false activity by that viciously intelligent lower nature which now knows that the man, in his new ways of life and thought and effort, proposes to desert it, to humble it to its proper place and work, to make it servant. It appreciates this better than does at first the mind of the man himself. It is the subconsciousness stung into precautionary activity. It is not conscience, though it makes a very good imitation. And it calls to its aid the faint shadows left in "space" by the evil deeds of the man in other lives.

The man who conquers is free; his will, grown and strengthened by the effort, can now deal with his lower nature with tenfold the efficiency; he has breathed breath after breath of the light which is life; he has evoked a sunrise in himself; the path is open.

But what then of the other, who got "free-

dom" by confession? Let the thinker ask himself, *How was the confession other than hypnotism and subsequent suggestion?* Fear was not exorcised by will; no self-confidence was gained. The man is not more than he was. Fear was taken off him, not thrown off by him. He is no better able to deal with it, with this prime disintegrator of human nature, this enemy of light, this weapon of all the demons.

That the process is suggestion is now apparently admitted by the Church employing it, which thus stands revealed as the *hypnotiser of the centuries*. A San Francisco paper publishes certain news items "prepared," it claims, "by the International Catholic Truth Society," and furnished to it for publication. In the issue of February 7 the first of these items is as follows, italics ours:

New York, Feb. 6.—Father Thomas E. Sherman, son of the great General Sherman, thinks that the followers of the Emmanuel movement are just beginning to grasp an idea quite familiar to Catholics for centuries past. He declares that the church "has had, and used, the same method of healing through the mind for hundreds of years. Our confessional takes the place of suggestion. Ever since I was seven years old I have relieved my body of mental troubles by confession. The great interest with which the people are receiving the Emmanuel movement shows the desire of the American people for a more adequate religion, one which touches the whole body and mind."

If the phantoms of fear and remorse that hover over the opened graves of dead memories could be hypnotized, or suggested, away for ever, the case against the operation might have to be differently argued. But they cannot; if they are not faced and dissipated by the power of the light during life, they are waiting on the other side of death. Father Sherman words it well enough; the hypnotic confessional has so altered *the body* that it does not feel fear, the body on its subjective side, to which the mind is so closely bound. But after death the mind cannot be thus shielded. For a while its actual business is precisely the review of the whole field of memory — and then comes the chance of the unslain phantoms. It is then too late for the mind to stand in its own strength, sworded with its own central divine light. It never learned to do so *in the place of learning* — earth-life. And so it must remain for many hours that seem like eternities, so swift is consciousness then, learning nothing from a review it cannot complete because it is caught in the whirlpools. At last, mercifully, comes the rest-time, Devachan. But in the next following birth on earth — the Church has carefully hidden, for this among several reasons, the doctrine of reincarnation — the man bears the marks of the ravage of those hours, is weaker than before, more fearful, more dependent, more instinctively the subject of the confessional.

And so the Church has marked her own from life to life. But all the while the *souls* of her people have waited — waited; until they and not she should at last be invoked to redeem human life. H. CORYN M. R. C. S.

[The Bishop of Norwich in his reminiscences] pays a tribute to the many good qualities of the Chinese and the Mongols, though cleanliness is not among them. It was not till he got to Russian territory, fifty miles from the Chinese frontier, that he came upon a drunken village — the cause being the consecration of a church.—*From a review.*

TRIUMPHAL ENTRY OF KING GUSTAVUS VASA INTO STOCKHOLM IN 1523

PAINTING BY CARL LARSSON, IN THE NATIONAL MUSEUM, STOCKHOLM

Theosophy Simplified

WILLIAM Q. JUDGE says: "Theosophy is that ocean of knowledge which spreads from shore to shore of the evolution of sentient beings; unfathomable in its deepest parts, it gives the greatest minds their fullest scope, yet, shallow enough at its shores, it will not overwhelm the understanding of a child." The same great teacher of Theosophy also told us that an important part of the Theosophical work for many years should be the presentation of the leading principles, such as Reincarnation and Karma (the law of divine justice) in simple ways that would give something practically useful to those who were looking for the realities of life, and seeking to help others.

This sensible course has not been invariably pursued by some would-be students of Theosophy. Notwithstanding all the efforts of those who tried to make Theosophy a living power for moral and material improvement in the world, there were many who had not understood its spirit, or else boldly adopted some of its teachings for their own personal benefit. Many of the latter have preached sermons or have written books and essays which are simply unacknowledged Theosophy — and water! And we are not yet free from such plagiarists. Worse than these, a certain class takes advantage of the name Theosophy (for the name itself has an attractive power) to promote hypnotic and other pernicious practices which are diametrically opposed to its teachings and were denounced by the Founder of the Movement, Helena P. Blavatsky, in uncompromising terms. Her Theosophy — sane and wholesome Theosophy — teaches us to be positive, to stand up in our own strength as souls, and to draw upon the inexhaustible inner source of power and wisdom. A counterfeit Theosophy would hand us over, passive victims, to the control of other persons or of unknown forces, under the pretense of

soul development, mistaking psychism for soul.

Then another class, literary folk, would shelter a very subtle kind of delusion under the sacred names of Theosophy or Occultism, and profess to explain in detail the working of many of the laws of hidden Nature which H. P. Blavatsky left in briefest outline — for her own excellent reasons. The way in which certain pseudo-Theosophical books have been written is so skilful that the attention of the reader is led away, unconsciously to himself, from altruistic and purely impersonal ends to the desire for personal power and the personal gratification of intellectual curiosity, the egotistic satisfaction of knowing something — whether true or false he cannot tell — that is hidden from others.

Another subtle perversion of the simple Theosophical teaching of man's dual nature is found in the abuse of the new scientific discovery of some of the lower psychic powers in man, such as thought-transference. There is, of course, nothing new in this. It has been known for time immemorial, to all students of such subjects who were not blinded by prejudice; but so greatly have the materialistic minds, forced at last to acknowledge something outside their own groove, been astonished, that many of them are sure they have discovered the soul! The part of our nature which possesses these little-known attributes is not the immortal Higher Ego, for that is immeasurably removed from the plane on which they act. But see what the charlatans are saying about this "subliminal self," as it has been dubbed! Sordid advertisements of advice, for dollars, as to how to control its faculties in order to prosper in love, in money matters, in influencing others without their knowledge of it, and so forth, teem in certain periodicals. This is "Theosophy simplified" with a vengeance!

But the simplification of true Theosophy — the problem which W. Q. Judge saw was be-

coming necessary if its message was to reach the widest circles — was the problem that faced Katherine Tingley, who succeeded him thirteen years ago, and her work has solved it. The Gordian knot has been cut in the most natural manner.

Jesus told his followers to become as little children in order to enter the kingdom of heaven, and another great teacher told us long before that we must regain the child state we have lost. This is the sum and substance of Theosophy. How?

In early childhood we live in a most spiritual atmosphere; the egotistical personality has not yet gained full control. The distinct sense of being a separate person does not come for the first few years of life: many of us know the surprise of that discovery. But *consciousness* is vivid long before that, and it is a wider feeling than the self-consciousness of later years. It breathes in unity with Nature, the glory of the earth is its own glory. How fortunate are those who can carry even a trace of this impersonal rapture into their later years! But alas! the personal self-consciousness too soon pushes aside or overpowers the spiritual consciousness and life is no longer joy.

Theosophy is master of the situation, for in the Rāja Yoga system of education established by Katherine Tingley personal egotism is reduced to a minimum. The Higher Ego, the real man, possesses the keys to all the beauty and all the wonder of the universe, and a Theosophical training leaves it free to act.

Theosophy simplified has lost nothing of the original teachings; it means Theosophy deepened and widened; it means a more perfect carrying out of the desire of H. P. Blavatsky's great compassionate heart. It means a higher life for all humanity in the future, a Paradise regained, a new heaven and a new earth for mankind redeemed. STUDENT

Isabel Rubio---Cuban Patriot

ISABEL RUBIO Y DIAZ was born in the city of Pinar del Río on the 19th of November, 1836. She was the daughter of Dr. Antonio Rubio. There had been doctors in her family for many generations, and when still a small child little Isabel had acquired quite a knowledge of medicine herself, which she applied in a very practical way on the suffering poor in the neighborhood of her home. From the beginning it seemed as though the chief object of her life was to relieve suffering in whatever form she found it.

By the time she was fourteen years of age, Isabel Rubio had become the idol of the inhabitants of Guane, many of whom were free patients of her father, who gave her names of endearment and respect. Wherever there was a lack of food or medicine, or wherever there was suffering, there was Isabel, by day or night, giving food, medicine and encouragement. Her father, a wealthy man, was able to give her an allowance for personal use, and this she spent in buying medicine, clothing, etc., for the poor. As the years passed, her capacity for helping those around her grew, and as the conditions in her country became worse, she devoted all her time to philanthropic work. Thus passed the early part of her life.

Somewhat later, when the Revolutionary war commenced, Isabel Rubio made several journeys to the United States, and in Key West met Maceo, giving him much assistance through her knowledge of the geography and condition of the western end of the Island. She worked with him for years, and Maceo said he always knew his wounded soldiers were safe when she was near. When the Revolution broke out Isabel returned to her province and dedicated all her time to nursing the ill and wounded. Her name was always on the lips of the sufferers and wherever she went she brought life and comfort. Her only son went to the war, and she also—to the camps where the wounded lay, nursing them day and night. The camp hospitals were often moved

and many times she would have to ride on horseback for miles through dense trees and thickets, often at night, from one camp to another. She usually went alone. Her own purity and devotion to her work and the respect and affection which she had gained, were all the protection required. On the 12th of February, 1898, her hospital, filled with old men, women, and children, in the hills near San Diego de Baños, was surrounded by the enemy. Unable to protect longer those for whom she was caring, she fell wounded and was taken, a prisoner, to the city of Pinar del Río. Here she died the 15th of February of the same year.

Isabel Rubio did not work under the direction or protection of any religious body. She

MEASURE thy life by loss instead of gain
Not by the wine drunk, but the wine poured forth;
For love's strength standeth in love's sacrifice,
And whoso suffers most hath most to give.

Harriet Eleanor King (Selected)

stands out alone as one of those true helpers who followed the promptings of a loyal heart, and she gained her great strength and capacity through her unselfishness and love for others. Over the door of the hospital ward in which she died, is a plain white tablet bearing her name. One of the streets of Pinar del Río, not many years ago, had its name changed from Recreo to Isabel Rubio. On this street now stands the Râja Yoga Academy, and in this Academy are five nieces and nephews of this woman patriot, who, with many other children are learning more every day how much they owe to those who gave their all for their country and the sufferings of others. Isabel Rubio will ever live in the hearts of Cubans who love their country.

(From notes written by Maria Luisa Cuervo, niece of Isabel Rubio. Pinar del Río, Cuba.)

The Work of a California Woman

HISTORIANS of the Twentieth century and those who come after will record that the world owes the preservation of one of its greatest natural wonders to the persistence and generalship of a woman—and this in the face of tremendous obstacles. To Mrs. Lovel White, a daughter of California, we owe the preservation of the Golden State's most priceless possession—for once despoiled of it all the wealth of the Indies could avail nothing to make good the loss—the Calaveras Grove of Big Trees (*Sequoia gigantea*) in Calaveras and Tuolumne counties. Not long before his official retirement President Roosevelt signed the law enacted by Congress creating the Calaveras National Forest, a law for which Mrs. White has been working for nine long years.

These giant trees have been "known to the world," to use a current phrase, only since 1841 when a few pioneers, anticipating the gold-seekers of the next decade, "discovered" them. The news was widely published and a number of Europe's most distinguished scientists came to America solely to pay these trees a visit. Shortly afterwards one of the largest was purchased for \$10,000 by an English agent, who removed the bark in sections (of course killing the tree in the process and leaving in the forest tragic witness of his work in the bare white lonely trunk standing in ghostly grandeur) and conveyed it to London. There he set it up over a cylindrical model which was exactly the size of the tree, and the whole was placed on exhibition in the Crystal Palace. Day after day crowds of interested visitors stood before it and in no long time the news of this wonderful grove had literally gone round the world.

Scientists have stated that these trees are the oldest living things on earth today, using the term "living" in its ordinary acceptance, not the Theosophical one. Indeed, in their knightly strength and beauty they seem more truly "living," more truly partakers of the

elixir of divine, all-pervading life, than a good many of the apologies and moral foundlings that are walking about the earth today.

Before the United States acquired possession of the grove a number of the giants were laid low by the lumberman's saw and axe, and so we are enabled to get a fairly correct idea of its age. While some assert the oldest to be not less than four thousand years of age, yet the actual counting of the rings of those felled (not, however, of the largest, as these still stand) has brought the years of several beyond the two-thousand mark, and in one 2425 separate and distinct rings were observable. Says one writer:

An age of 2425 years means a good deal when one stops to think of it. The known history of the world has nearly all been made in that time. The little seedling was just pushing through the granite soil of the Sierra Nevada Mountains and taking its first bath of sunlight the year that Cambyes of Persia defeated the Egyptians at Pelusium, on the Isthmus of Suez, and overran Egypt.

It was 28 years old when the battle of Lake Regillus was fought—the first authentic date in Roman History; 35 when Miltiades gained the victory at Marathon; 41 when Herodotus, "the father of history," was born; and 45 when Leonidas perished at Thermopylae. It was 124 years old, and was doubtless beginning to overtop its fellows, when Xenophon led the famous "retreat of the ten thousand" through western Asia. Practically all Greek literature, except Homer's books, has been given to the world since the infant days of that Sequoia, and the array is ancient, imposing, and venerable—Aeschylus "the thunderous," Sophocles "the royal," Euripides "the human," Socrates "the wisest," Demosthenes and Phocion, the greatest orators. Plato and Aristotle, the founders of human philosophy, and Alexander the conqueror of the world. The tree was 202 years old when Alexander died at Babylon, 307 when Hannibal crossed the Alps, and 589 when Nero fiddled as he watched the "Eternal City" of Rome being destroyed by fire. . . .

In short, almost the entire chronology of the human race, so far as recorded history goes, is embraced in the lifetime of that one tree which was felled in a few hours by lumbermen, hurried through the sawmill and sold as ordinary lumber. Nearly the same can be said of many others which have gone the same way in that region. It has been the most awful slaughter of venerable giants of antiquity ever recorded.

In this now national forest, which comprises about 4000 acres and contains nearly 1500 giant Sequoias besides numbers of enormously large sugar pines, yellow pines, white fir and incense cedar, no tree less than eighteen or twenty feet in circumference is considered large, while many are between sixty and eighty feet. Most of them have been named, as *Mother of the Forest*, (the one killed to furnish forth a department in the Crystal Palace Exposition), *Father of the Forest* (felled some years ago and furnishing as much timber as twenty acres of ordinary timber land), *Waterloo, Pennsylvania, Abraham Lincoln, Old Bachelor, Two Sentinels, W. T. Sherman, Knight of the Forest*, etc.

One of the most interesting, albeit pathetic, records written by time and catastrophe upon these giant beings is that of forest fires. In the case of one tree which after being felled was found to be at least 2171 years old, there were unmistakable proofs of its having been severely burned four times. The first burn dates from the year 245 when the tree was 516 years old and the scar was 105 years in healing. For trees heal their scars, when not too deep or extensive, as humans do, by a new

growth proceeding inward from the edges. The next burn was suffered in 1441, the third in 1580, and the last, which was very severe, covering a space eighteen by thirty feet, in 1797. When the lumbermen felled the tree this last scar had not entirely healed. This was in 1900, and since then many others have gone the same way, mute witnesses of man's blindness and unsympathy with nature.

Does it seem as though we were writing of anything less wonderful than giant *souls*, lingering to read us some legend or past mystery-lore from prehistoric days? Sentinels and knights! Above their heads heaven's open sky, at their feet, safe-sheltered beneath their spreading, brooding arms, bloom violets and maiden-hair. Oak and laurel stand sturdy but anear, lessoned in self-reliance by these, the

ISABEL RUBIO Y DÍAZ, CUBAN PATRIOT

UNTO each man his handiwork, unto each his crown,
The just fate gives;
Whoso takes the world's life on him and his own lays down,
He, dying so, lives.

For an hour, if ye look for him, he is no more found,
For one hour's space;
Then ye lift up your eyes to him and behold him crowned,
A deathless face.

Swainburne

Elder Brothers of their forest world. Yet excepting for the heroic battle fought for nine years by a California woman, and at last won, another decade would have seen the last of these giant glories felled and dishonored in sawmill and lumber-mart. And all our penitence, in that case, would work no more of a miracle than it worked for the woman who, in olden days they tell us, went to Confucius for help in winning back the love of one whom she had betrayed. "Pour the water from this cup upon the earth," said the Sage. The woman did so and watched while the thirsty earth drank it in. Then said the Sage again, "Can you gather up the drops you have spilled and place them again in this cup?" STUDENT

The Melting-Pot

I will bring the third part through the fire and will refine them as silver is refined.—*Zachariah*

HUMAN life is in the testing. Encrusted, hardened, blackened, through thousands of years of careless exposure, roughly-handled humanity is actually passing from one state of being into another: the metal liquefying, clarifying, eventually purifying, and running into molds of superior worth and shape.

The process of throwing off dross from the nature takes place in the seething melting-pot of trial. To melt off an encrustation of habit, desire, hereditary taint, is not the process of washing clean a mere soiled spot. It requires a melting down of the whole mass, a thorough throwing out of the worthless scum, else, upon resuming solidity, these impurities simply change form and diffuse themselves throughout the whole.

What is it, then, to throw back into the half-refined mass of another's nature the dross that has been once skimmed off?

It is not a new figure, but as old as the struggle of humanity, yet we will not learn to stand away from the melting-pot of our neighbors. We must play busybody and add fuel to the fires and stir up the ingredients, having not the slightest knowledge whether the one or the other act be necessary or advisable—and no suspicion that both are meddlesome and harmful.

Certain persons are disagreeable to us. It would be helpful to think out (we might do so if we would bring ourselves to so much fair-mindedness) how we brought out in them that very disagreeableness. Haven't we stirred the fire, or thrown foreign matter into the molten mixture, that causes it to hiss and bubble?

Noting the deep and lasting effect of the words and the bearing of others upon ourselves, we ought to know something of the seriousness of this matter of association with our kind. From the test going on in our dooryard we should be gathering wisdom to pass harmlessly among the melting-pots in the neighborhood. Some day, and, if we gain only a little caution in this regard, it may not be a far-away day, there is to be a running-off of this precious cleansed mass into forms of a brightness approaching the beautiful. STUDENT

An Old Statute in Force

INTERESTINGLY reminiscent of old Puritan days is the recent arrest, in New Jersey, of a man and his daughter as "common scolds." The statute under which they are indicted provides for a penalty of three years' imprisonment or a fine of not more than \$1000 for any person convicted of commonly scolding and disturbing the peace of the neighborhood and of all good and quiet people, to the common nuisance of all the people therein, residing, or passing.

But we never read of men "scolds" in the old days. Can it be that the man only yesterday indicted is the first of his line, or have the writers of histories spared us the painful whole truth? Few of us knew, either, that this ancient statute still held in any of our States. It might be described as a case of legal atavism, yet if we need statutes to provide remedies for the wrongful use of other sharp weapons, why omit the tongue, sharpest sometimes, and cruelest, of all? STUDENT

OUR YOUNG FOLK

FLOWERS

WE are the sweet flowers,
Born of sunny showers,
(Think, when'er you see us, what our beauty saith;) Utterance mute and bright,
Of some unknown delight,
We fill the air with pleasure by our simple breath;
All who see us love us, —
We befit all places;
Unto sorrow we give smiles, and unto graces, graces.
Mark our ways, how noiseless
All, and sweetly voiceless,
Though the March winds pipe, to make our passage clear,
Not a whisper tells
Where our small seed dwells,
Nor is known the moment green when our tips appear.
We thread the earth in silence,
In silence build our bowers, —
And leaf by leaf in silence show, till we laugh a-top,
sweet flowers.

Leigh Hunt

"Help Nature and Work On With Her"

WHO has watched the unfolding of leaves, the bursting forth of buds and blossoms, and the greenness of the grass that spreads itself over lawn and meadows, and has not felt a sense of hope and gladness, as though the trees, grass, and flowers seemed to say, "I told you so, here we are again!"

All winter long the little seed has slept in the dark earth, covered over with ice and snow; but in the very heart of it there was a tiny germ of hope, telling it to wait until the warm winds blow and the bright sun shines once more. And the busy little birds as they go cheerfully about their nest building, chirping and twittering, they, too, seem to say "Hope! hope! hope!"

Nature is the great teacher, and if we would only wait and watch and listen, the story of life and death, of immortality, of the duality of all things, is so plainly written that he who runs might read. Cause and effect, action and reaction, we meet in every part of nature, in the ebb and flow of the tide, in day and night, in heat and cold, in the inspiration and expiration of plants and animals, in sowing and reaping, the growth and decay of all vegetation, the birth and death of the flowers, and their re-birth year after year. And thus we recognize that as eternal life pervades nature, so an eternal spiritual life pervades the realms of consciousness, adjusting all needs and deserts. As the indestructible life in Nature preserves the balance, destroying what is useless, recreating what is useful, and being in short a divine law of justice in the lower kingdoms, so the moral law adjusts things in the moral or spiritual world, destroying the evil and regenerating the good.

In the forests the trees do not change from one kind to another; the oak is always oak, the pine is pine; and so it is with the seeds we plant. If we sow forget-me-not seed we do not expect to raise hollyhocks; nor if we plant potatoes do we look for cabbages or corn to grow. What we sow we reap. The harvest

depends upon the kind of seed we sow, upon when and where it is sown, and how it is taken care of. To be a successful farmer, or in fact to succeed in any department of life one must be largely endowed with the spirit of hopefulness. The shiftless, good-for-nothing farmer is the one who always has a tale of woe; he is quite sure the frost will spoil the buckwheat, or too much rain will spoil the hay. From his pessimistic point of view a famine or some other dire misfortune is just at hand; whereas the hopeful man tills his farm or plants his garden with the firm conviction, that as he has put forth his best effort in careful sowing and watering and diligent weeding, he has a right to expect good results. He works not against but with Nature.

In one of our Theosophical books we read:

Help Nature and work on with her and Nature will regard thee as one of her creators and make obeisance. And she will open wide before thee the portals of her secret chambers, lay bare before thy gaze the treasures hidden in the very depths of her pure virgin bosom. Unsullied by the hand of Matter, she shows her treasures only to the eye of Spirit—the eye which never closes, the eye for which there is no veil in all her kingdoms. (*The Voice of the Silence*)

STUDENT

Do Thy Best

"IF a thing is worth doing at all, it is worth doing well." Maurice laid down his pen and stared out of the window. Why did those words haunt him? And why did he feel unhappy when they fell upon his ears? Here was Barton saying the same thing!

"Bosh!" he heard Arthur reply, "You are obliged to do things well, because you are at school, that is all; catch me —" but the master was coming their way. He passed silently along the class scrutinizing each boy's work.

That afternoon the master called the senior boys together and told them that he had received an application from one of the best firms in the city for an office boy, saying that their decision would rest upon his recommendation, and that the qualifications necessary for the position were good handwriting, steady application, and a cheerful, self-reliant, obliging disposition.

The chance meant much to many of the boys, especially Maurice, Barton, and Arthur. Whom would the master's choice fall upon? Kindly he turned upon the upturned eager faces; he would not keep them in suspense.

"I have recommended Barton," he said, "for he is the only boy in the class who fulfils all the stipulated requirements."

"Maurice," he continued, "has possibilities, and aspirations, and ability, but at present he lacks steady application; while Arthur — and I speak of you three, because you are the eldest, and closest to facing your future life-work — allows undoubted ability to waste in the untilled ground of indifference to duty; so, though Maurice writes the best hand, and Arthur is obliging, Barton deserves the recommendation for an all round reliability. And remember this, boys, chances come to us all, but we can only take those which we have fitted

ourselves to take. How many a useless life is the outcome of discarded chances and the 'unjust fate,' bewailed, the result of our own action. This, boys, is what Theosophy is teaching us; and showing how life after life we can climb to knowledge, power of helpfulness, and joy undreamt of in the sordid misconception of one miserable earth-life! We live again, hundreds, thousands of times, live until we have learned the lesson of *Universal Brotherhood!*"

He had forgotten that they were young and he was old, and so had they. He was speaking to them as they had never heard him speak before, this strange old master — aye, straight to their hearts! And he felt their interest and sympathy and their needs.

Yes, Barton had gotten his chance! But so had they, thought Maurice, as he packed his books neatly into his bag, smoothing out the "dog-eared" corners. "I must learn something more about Theosophy — if a thing is worth doing at all, it is worth doing well." The haunting power was gone, it had become a living truth to him, a something to make part of his life.

ETHNE

Tramping in Switzerland

IN Switzerland in summer one can tramp all day and not feel tired; for the air is so fresh and exhilarating, and the snow-clad peaks towering above the world give one such an uplift in spirit.

We were going to the Grindelwald, that great river of ice that flows between two mountains. On the way, where the road winds round a precipice in the heart of the mountains, an old man came out of his little cabin overhanging the steep and blew a great blast on an Alpine horn. The echoes rebounded from mountain-side to mountain-side again and again, ever fainter and fainter until at last they faded away like the last dying breath of a chord struck on a great organ. On the wall by the horn was placed a little box in which passers-by could drop a franc, or some sous, if his blowing had given them any pleasure, but he didn't ask for anything.

A little farther on when we began to think of choosing a spot to rest in, we came to a little booth covered with green boughs where a pretty fresh-faced mountain girl served us with a bowl of wild strawberries and a pitcher of cream.

All along the way we saw old women scrambling up steep hillsides, watching a few goats or cows — that they did not graze on a neighbor's property, for there are no dividing fences. We met men climbing down mountain trails with big cheeses strapped on their backs, on their way to the nearest market.

At dinner-time we came to an inn overlooking a great valley. The tables were all out of doors among the trees, and hungry trampers were served with a meal of brown bread, cheese, country wine, fresh mountain berries, and cream. At last we came to the frozen river known as the Grindelwald Glacier and began to cross it. Another time I will tell you something about that.

L.

THE CHILDREN'S HOUR

LOST

SOME precious little moments
That once were given me;
If only I could find them
I would not idle be.

A jewel called "Patience,"
Its setting was most bright;
A gem much prized by others
To whom it gave delight.

The chance to do a kindness,
A loving word to say;
A few these of the losses
That I have met today.

Helen Elizabeth Coolidge, "Poems."

"Better to do One's Own Duty"

FROM a corner of the barnyard came a very dissatisfied grunt.

"Moo-oo-oo, Piggy-Wiggy, why are you so blue?" asked a pretty little red cow.

"Oh! Bossy-Wossy," answered the spotted piggy, "I have been meditating on my sad lack of talents, compared to those of some creatures."

"Why, Piggy-Wiggy! I don't see but that you are as capable as most of us are. Besides, all that is required of any of us is to be useful in our own way. I have to give good, rich milk, and be a good bossy, while you—why! all you have to do is to eat and get fat; you should not complain of your lot."

"Alas! yes," answered the piggy, "but it is very monotonous just to eat and root up holes in the ground. Besides, here we have always to stay inside of doors or gates, or fences, wherever we are put."

"Well, where would you rather be, Piggy-Wiggy," asked Bossy.

"In that orchard," answered Piggy, quickly, as he poked his nose through a hole in the yard-fence. He had been looking at the apples for many days.

"Just think," continued Piggy, "if we were as talented as a man, for instance, we could do anything we pleased. Why a man walks on only two of his feet, and he has the other two to do anything he likes—open doors and gates and everything. I've been thinking, Bossy, if we tried, we could learn to do more than we do. Now, I am sure, with your horns you ought to be able to learn to open a door or a gate. Why don't you try? I'm going to see if I cannot learn to walk on two feet instead of all four."

"Oh Piggy-Wiggy! you are very funny!" moo-ed the bossy, with a gentle laugh, "but to please you I'll try."

So Bossy went up to the gate that led into the orchard, and, with her horns, began to hook at the big wooden latch that fastened it; while Piggy jumped up with his fore-feet resting on the fence, and tried standing on his hind legs.

"Well Piggy-Wiggy, how does it go?" called Bossy after a while.

"Why it isn't so hard, Bossy-Wossy; what luck are you having with the gate?"

Lomaland Photo. and Engraving Dept.

SWEDISH LOTUS BUDS, POINT LOMA

"Well, I can move this queer latch already, and I believe if I keep on trying I'll learn the combination."

So Bossy and Piggy, in their attempts to develop new faculties so as to gain greater freedom, kept on trying every day. To be sure, Bossy's milk fell rather short, for hooking at a gate is rather strenuous work to one accustomed to quietly chewing her cud; while I am afraid Piggy grew lean instead of fat by practising acrobatic performances. However, one day, Bossy discovered that if she pushed the gate with her head while she lifted the latch with her horn, the gate would open, and behold! the orchard was theirs.

"Now Piggy-Wiggy, stand up and shake off some apples, there's a dear," cried Bossy, gleefully.

So Piggy stood up and caught a branch in his mouth, and a few vigorous shakes sent many luscious apples flying to the ground, to their great joy.

"Nothing like developing one's talents," murmured Piggy, munching as though he were starved.

But alas for Piggy and Bossy! Through the orchard came that talented man, who, with a great stick beat them back into the barn-yard, grumbling at the careless person who had left the gate ajar.

The blows caused the two aspiring offenders' backs to smart pretty badly, but that did not discourage them. They felt in duty bound, of course, to make use of their newly acquired talents; so the next day, and the next, and many days after, did they seek the orchard, until the mystery of how that gate was opened was discovered by the man's little boy, who was playing on the straw-stack.

"Aha!" cried the man, "you certainly are clever animals, but I'll teach you to keep your own places," and he attached a strong chain to one of Piggy-Wiggy's fore-feet, and one hind-foot; while Bossy—oh! poor Bossy! both of her nice crumpled horns were sawn off short, and her looks were ruined forever.

And now, children, you need not laugh and say you do not believe that Piggy and Bossy could do anything so clever, for unless you have lived in the country and studied the habits of our dear friends the domestic animals, you do not know what clever and intelligent tricks they will play, even though they do not talk as much as you and I do.

AUDREY

Animals with Pockets

DID you ever think what a curious thing it is that some animals have pockets?

Great roomy, fur-lined vest pockets big enough to carry a family of little ones about in! Many of the animals native to Australia and Tasmania have these convenient pockets and so has the opossum, a common animal in our Southern States. The family name of the owners of the pockets is *Marsupialia*, and the Kangaroo is the largest of the species. Full-grown kangaroos go sixteen feet at a jump, and so when going on a long journey, or running from hunters, think what a comfort it must be to Mother Kangaroo to know that her babies are snug and safe in her pocket; and if they have a taste for scenery they can peep out of the top at the passing landscape, just as little children peep out of the car window when traveling.

itarian work. All who assist in this work are directly helping that cause.

THE MYSTERIES OF THE HEART DOCTRINE

Prepared by
KATHERINE TINGLEY
AND HER PUPILS
*The Theosophical
book of the
Twentieth century*

Tells the story and the history of the
Theosophical Movement.

The prices are \$2 in cloth and \$1.00 in
paper, which barely cover the cost, for it is
printed and bound, not gaudily, but with
such carefulness and thoroughness of art
and craft as to make it unique among
modern edition books.

SOME OF THE ERRORS OF CHRISTIAN SCIENCE CRITICISM

by H. P. Blavatsky and William Q. Judge

CONTENTS:

"The Empty Vessel Makes the Greatest Sound"
A Note of Warning

—by H. P. Blavatsky

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by William Q. Judge

A MOST VALUABLE PAMPHLET. Outside of Theosophy
there is given no adequate explanation of the healing
that is at times accomplished, nor of its rationale,
nor of the ultimate price that must be paid and the
dangers connected with such practices.

This pamphlet is invaluable to all students.

Price - 15 cents

The Sun's Influence on the Earth

New Scientific Discovery Supports
Theosophical Teachings

IN an article in the CENTURY PATH, last year, reference was made to the proved effects of sunspots on terrestrial conditions, and a quotation was given from Dr. Huntingdon's summing up of his conclusions from the evidence. Since that date further observations have been discussed in scientific circles, and a remarkable and unexpected reason has been given for a certain incompleteness in the correspondence between the solar and terrestrial changes, a reason which adds still more force to the Theosophical position outlined in the article.

In brief, the teaching of Theosophy, given by H. P. Blavatsky in *Isis Unveiled* and *The Secret Doctrine*, is that the sun is the heart of the solar system, the center of a tremendous vital and magnetic energy which pulses through the system and produces most important effects upon planetary conditions, in spite of its distance and the apparent "vacuum" of space. Quoting from an archaic Commentary on the *Book of Dzyan*, she writes:

"The Sun is the heart of the Solar World (System) and its brain is hidden behind the (visible) Sun. Thence, sensation is radiated into every nerve-center of the great body, and the waves of the life essence flow into each artery and vein . . . The planets are its limbs and pulses."

Ten years before that she wrote in *Isis Unveiled*:

. . . the all-pervading, mysterious ether; the despair and puzzle of the materialist, who will some day find that that which causes the numberless cosmic forces to manifest themselves in eternal correlation is but a divine electricity, or rather *galvanism*, and that the sun is but one of the myriad *magnets* disseminated through space. . . This, and much more, they may learn; but until then we must be content with being merely laughed at, instead of being burned alive for impiety, or shut up in an insane asylum.—(Vol. I, 270)

Regardless of the ridicule of the smart writers of the day, the great teacher of Theosophy referred to warmly defended Kepler for having believed in the sun's magnetism. But things have changed in the Twentieth century, and exactly as she prophesied, "in the Twentieth century, portions, if not the whole, of the present work [*The Secret Doctrine*] will be vindicated,"

The Secret Doctrine Vindicated in This Century

and a great rent torn in the veil of materialism. So we find today that the magnetic influence of the sun on the earth is an orthodox teaching of the new astro-physics. In view of the many recent corroborations of

Theosophy, upon lines which seemed incredible to the materialism of the Nineteenth century, it is surely high time that independent minds today should realize that the desired clues leading to a deeper knowledge of Nature and Man are to be found in the study of Theosophy.

To return to our subject. The dark spots on the sun have been regarded for some years as the principal focal centers of solar activity, and the wonderful discovery by Professor Hale, of Mt. Wilson Observatory, California, of the electric nature of the vortices of hydrogen partly confirmed this; but now it has been found that there are still other "regions of solar activity" of great importance. These are the *faculae*, irregular patches of greater brilliancy than the general surface of the sun. Sunspots frequently, but not invariably, make their appearance in the *faculae*. The *faculae* have the power of stirring up the terrestrial phenomena every time they cross the center of the sun in its 26-7 day rotation period. As they last much longer than the spots—some even persisting for three years—their effect is more regular. In Bavaria, Württemberg and the Pyrenees, for instance, it has been ascertained that the storms occur at periods of 26 or 27 days. Now, then, we can see the reason for the gaps in the correspondence between the records mentioned by Dr. Huntingdon, for until now the *faculae* were not considered as active potencies.

M. Marchand, director of the Observatory of the Pic du Midi, has announced that "every maximum of the curve of magnetic disturbances on earth coincides with the passage of a region of solar activity over the central meridian, and *vice versa*. Exceptions are very rare." These disturbances assume the form of magnetic storms, auroras, cyclones, electric storms and earthquakes; their intensity varying according to the violence of the solar outbreak, the season of the year, the local condition of the atmosphere, the moon's electric induction, and the *phase of the moon!*—and, it is suggested by some, the position of the planets. Could these factors be fully known, weather and earthquake prophecy would become a science.

The positive demonstration that the solar activities radically modify terrestrial conditions, gives us at last something reasonable to account for the mysterious warnings that frequently precede earthquake shocks, for it is exceedingly difficult to believe that the strain in the rocks preceding the sudden slipping of a

Earthquake and Weather Prediction

geological "fault" could produce symptoms of the peculiar nature noticed before the readjustment of strata. But since the discovery that the solar regions of activity, the *faculae* and spots (the latter being furious vortexes of electric force) are the exciting causes, it becomes clear that as these regions are slowly carried toward the center of the sun's disk by its rotation, the disturbances in the electric conditions on earth should increase and become perceptible in one way or another before the culmination in the shock.

New Light on Earth- Structure

It has been noticed from time immemorial that animals and even birds show symptoms of fear and unrest, and many persons feel uneasy before serious earthquakes (in California "earthquake weather" is commonly spoken of) and ocean cables are disturbed by magnetic currents for hours before the shock. Before the great catastrophe at San Francisco, in 1906, a bluish haze seen was attributed to static electricity; and it has lately been shown that seismic disturbances are frequently preceded by an increase in the negative charge of the ground. These and other premonitory symptoms find a place under the new theory, and show that we have advanced a step in the understanding of proximate causes, in the realm of objectivity at any rate.

But what of the Ruling Power in the sun which sends forth this terrible and beneficent force whose results are so far-reaching? Do the Solar centers of energy burst out fortuitously, or does an Intelligent Law control? Are men swallowed up and ruined by thousands every year by mere chance? Have they reaped what they have not sown? Is not the cataclysm the reaction of effect to cause, or does chaos reign? Some will say that is the will of a personal God, but Theosophy goes deeper and shows that Intelligent *Law* rules, and that if man breaks the harmony the reaction of suffering may take various forms, even that of the earthquake. "We make our own storms," says William Q. Judge, and to accuse the Higher Law of blind, ruthless action, is really blasphemy. The old Hebrew legend of suffering entering the world through the sin of Adam has a profoundly true basis, if we remember that Adam is a generic term.

Until people begin to realize that they are part of a great whole, that Solidarity is the one ultimate fact, the interaction and interdependence of suns and planets and sentient beings will only be accepted on a physical basis.

Even this is an advance on the limited ideas recently held, but it is the province of Theosophy to extend the knowledge of unity into deeper planes, mental and spiritual; to help man to work out his own salvation, until, purified by the lessons learned through many reincarnations on earth, he attains a godlike stature. External nature, as the raging passions of humanity are purified, will become peaceful *pari passu*, new conditions and new and subtle forces will appear until the culmination of our planet's evolution, when the old things will be rolled up like a scroll and a new and grander field of action opened out for a glorified mankind—the result of his own efforts. R.

The Living Universe

A POET must almost necessarily be a metaphysician, but we painfully learn from their great books that a metaphysician is not necessarily a poet. In the current *Hibbert Journal* Professor James abstracts for us the little known philosophy of one who was both, O. T. Fechner, whose greatest book, *Zend-Avesta*, has just—after fifty years—passed into its second edition.

The whole universe is conscious; that is the sum of the book. The following passage seems to tell us the dawn of the idea:

On a certain spring morning I went out to walk. The fields were green, the birds sang, the dew glistened, the smoke was rising, here and there a man appeared; a light as of transfiguration lay on all things. It was only a little bit of the earth; it was only one moment of her existence; and yet, as my look embraced her more and more, it seemed to me not only so beautiful an idea, but so true and clear a fact, that she is an angel, an angel so rich and fresh and flower-like, and yet going her round in the skies so firmly and so at one with herself, turning her whole living face to heaven, and carrying me along with her into that heaven, that I asked myself how the opinions of men could ever have so spun themselves away from life so far as to deem the earth only a dry clod, and to seek for angels above it or about it in the emptiness of the sky, only to find them nowhere. But such an experience as this passes for fantastic. The earth is a sphere, and what more she may be one can find in mineralogical cabinets.

When we get a sensation through the eye, ear, or other sense-organ, it passes into the infinite complex of the mind, is understood, fitted into its place. The mind is forever modified and enriched by it; but whilst effecting this eternal enrichment and becoming woven into the fabric of human consciousness, it also remains itself, can be fetched forth again and looked at, or may on its own account come out into the field of attention. Whilst retaining its identity it has at the same time measurelessly expanded it. And when it does re-emerge for a time into the field of attention and manifest activity it is found to be itself the richer for the associations it has contacted while in the unmanifestedness of its Nirvâna.

This last point Fechner omits to draw inference from. We will presently venture to draw it for him. His special point now is that isolated sensations enter into the presence of a thinking self, and, whilst remaining self-identical, enrich that self. And whilst becoming themselves enriched by, they also in return enrich, each successive later sensation, helping it to its full meaning.

As each sensation stands to the human thinking self, so each thinking self stands to the great Self, Humanity.

Similarly the human and animal kingdom at large are members of a collective consciousness of a still higher grade. This combines with the consciousness of the vegetable kingdom, in the Soul of the Earth, which in turn contributes its share of experience to that of the whole solar system; and so on from synthesis to synthesis, and from height to height, till an absolutely universal consciousness is reached,—the All Self.

Fechner likens our individual persons on the earth unto so many sense-organs of the earth's soul. We add to its perceptive life as long as our own life lasts. It absorbs our perceptions, just as they occur, into its larger sphere of knowledge, and combines them with the other data there. . . . If you imagine that this entrance into a common future life of higher type means merging and loss of distinct personality, Fechner asks you whether a visual sensa-

tion of our own exists in any sense *less for itself or less distinctly*, when it enters into our higher relational consciousness and is there distinguished and defined?

But Fechner does not suggest, as he might, that as a sensation after mergence into the rich total of mind from time to time gathers itself together and stands out again clearly in the field of thought: so, if the analogy holds, does man time and again come forth as himself from temporary mergence in the greater mind—that is, reincarnate; which thus is seen as an essential in the philosophy.

Fechner's conception is not new, nor has he worked it out to its completeness. But it does him great credit, working alone, to have done so much. An old book, quoted by H. P. Blavatsky, makes the *sun* the dwelling-place of the synthetic planetary selfhood.

But Fechner's point of consideration is not so much the outgoing *from* the successively higher selves to their dependent lesser selves, the outgoing of vitalizing energy—as the income *to* the higher from the organs outstanding. But both processes would be necessary for a total cycle of activity. STUDENT

Antarctic Expeditions

THE first Antarctic expedition of recent times set out under Sir James Ross in September, 1839, with two ships, *Erebus* and *Terror*, and crossed the circle on New Year's day, 1841. They discovered high land, which Ross named Victoria; a volcano, which was named Erebus; and a huge wall of ice, which barred further progress.

A few years ago Victoria-land and the ice-cliffs were again sighted, by a Norwegian expedition sent out to search for whales. It made the 74.5 parallel of latitude.

In August, 1898, Sir George Newnes fitted out the *Southern Cross*, commanded by Borchgrevink, and it reached 78° 50'.

The *Discovery*, under Scott, reached South Victoria Land on January 9, 1902, and skirted the ice barrier, which extends far to the east, rising to heights of from 130 to 280 feet. A new land was found and called King Edward VII Land. Returning to winter quarters near Mount Erebus, the *Discovery* was frozen in. Erebus and Terror were found to be on a large island, and not as Ross and Borchgrevink had supposed, on the mainland. In September, 1902, Scott started south on a sledge expedition, which lasted 94 days and revealed the coast of South Victoria Land to 82° 17'.

Lieutenant Armitage traveled west for 52 days and reached an altitude on the inland ice-cap of 9000 feet. Though traveling thus far inland, he saw no indication of sea beyond. He found huge glaciers; but, though the ice-cap was thousands of feet thick, it did not overtop the mighty range of mountains stretching parallel with the coast.

A German exploring vessel, the *Gauss*, was frozen in the ice in 60° 30', and remained there for nearly a year. It discovered a new land and named it Kaiser Wilhelm Land.

In February, 1902, Nordenskjöld established his winter quarters on the coast of Graham Land, south of Tierra del Fuego, purposing to make sledge journeys inland. In November, 1902, the steamer returned to Graham Land to bring home the party, and was expected to return to South America last February, but has not been heard of.—(Kansas City *Star*)

Some Views on XXth Century Problems

America

HERE is an annual ceremony at the Mint, one which if seen with open eyes would be more solemn than all the funerals of the year in one. It is the burning of the worn-out paper money.

No man's soul is tied to any given dollar bill. But many have their souls tied to, incarnated in, drowned in, the totality of dollar bills that go through their pockets in the course of the years.

That is a very solemn table at the Mint, piled with dead dollar bills! The air about must be heavy, populous, murky, intense, a very quintessential distillate of greed, stiff and thick with emotion. And the fumes would presently take the shape of a black squatting idol, fatly smiling upon a nation of worshipers.

The American nation! And we wonder why no school of American art, of American poetry, music, has arisen, as much superior to the schools of the Old World as our cash is more voluminous than the cash of the old world and our energy greater than its. Sometimes we try to believe that such schools of ours do exist. We proudly point to this, that, and the other man—real geniuses, some of them—and call them representative. But we know that they are nothing of the kind, that they are isolated figures that have no specific relationship with *America*. Poe might have written and Macdowell composed, in France; Whistler *did* paint there. An Elisha for Whitman's mantle has not yet made his shoulders visible—unless it be Edward Carpenter the *Englishman*!

This must be so whilst we regard *business* instead of *living* as the great end of life. Business is *work* with the human hues and touches, the humanity, as nearly as possible removed. "Business is business"; there is no room for sentiment. But sentiment is unfortunately the necessary soil of schools of art and poetry and music. The man who, following an old craft, lovingly binds a good book with his own hands and soul together working, is *living*, is sentimental, is creating an atmosphere in which his child may grow up to be a poet, a musician: but not he whose soul is all in a "great book-binding concern" with a thousand "hands." That is it: a man is a "hand," and the one who runs him a brain. One has no time, and the other no inclination, to be a human man who may flower into divinity.

We chaff the Englishman in that he "worships a lord." Well, if that worship is three-quarters snobbery, it may easily be one-quarter idealism and poetry; and it is the sum of these one-quarters that create the soil from whence the poets and men of culture spring. *We* "worship" correspondingly the business magnate, and therein is no single gleam of idealism and poetry.

Before we can have American "schools" we must have America. The American will be a special type of man, not the general type hypertrophied here and there. He will not be the European with a keener knack for business. A man is no *special* man because he can eat four times as big a steak as another. And

"business" is mostly but the mental correspondent of the steak-getting and steak-eating activities. America is a soul yet to incarnate. It will come when we have learned what *leisure* is. Leisure is not the vacuity that comes when the money-getting appetite is satisfied. It is that field of the mind that is left free for humanization when the money-getting appetite is *crushed* into its proper dimension, shape, and function. The sum of these fields will ultimately be America. America and the Americans, when they come, will be very gladly and unjealously recognized by humanity as a new dawn, as the fruitage of time. STUDENT

It Was the Salt

FROM time to time some journal, anxious to fill up a slack moment in public attention, sends out a paper of questions to old people, asking them to which of their habits or avoidances they attribute their longevity. And some years ago a medical journal, perhaps desirous of putting an end to the practice, collected from many sources a number of the replies, putting them under heads. We then learned, not only the numerousness of the things and habits capable of causing length of days, but the curious contradictory power of doing both that and its opposite possessed by some of them. One centenarian, for example, owed his years to much salt; another to none. One to having always risen with the sun; another to having lain in bed until far into the day. Tobacco "dulled the nerves" and so promoted death; but it also "soothed" and so added to life. And so on.

But a similar phenomenon is seen much higher up the planes of being. Men have attained *spiritual* life through all sorts of creeds and beliefs. Then they credit the creed and through it interpret their spiritual consciousness. If that consciousness is very strong and clear their dogmatic enunciation of their creed will be very compelling upon others. But those others may *only get the dogma*, unable through it to reach the life beyond it. It will be lifeless, but none the less may they hold fiercely to every item.

A light came upon the soul of Dante and in his moments of inspiration the spaces became glorious for him. But when he came to write he had to use symbols and gave us the circles, spheres, and half theological imagery of his *Paradiso*. If he had been a religious teacher, had founded a creed, the circles and what not would have become for his followers the actual anatomy of heaven, to be textually learned, disputed about and defended as sacred dogma. There would be no other way to the light than through consideration of and belief in this inspired map of paradise. They would have forgotten that the light came first upon him, that it was the reality, and the picture altogether and merely his symbolization of it.

The "Garden of Eden" and "Golden Age" of so many legends of so many peoples are but humanity's memory of a time when its soul dwelt in the spiritual light and lived a life that we cannot understand. The ex-

ternal world was about it, but the stimuli of that world were not so compelling as we have let them become, so compelling as to blot out the other. Now they are all-dominating. Humanity is a poet and so, like Dante, before the inner glow had faded, it made the legends and pictures so express what it felt.

When upon some creed-holder, *because of his purity of life and love for mankind*, the old light burns out clear, he credits this to the specific dogmas of his creed. Dwelling upon them and developing them he may miss and blur his inspiration and even lose it altogether. In almost every case he will harden them for others and may thus *because of the very light itself* make their way to it difficult.

There are facts as to the spiritual world, and it is good and helpful to know them; but the first fact is that it is. This is the first statement of Theosophy; and the second, that man is in his inner nature—*now* inner—belongs to that world and has the light of it upon him and can awaken day by day more and more fully to it. He who does that can come back to the creeds and then see what it was that the creed-makers at their best were symbolizing. STUDENT

"What Jesus Would Do"

TEN thousand people in Cleveland have undertaken to do for two weeks "just what Jesus would do."

Would they have done "just what" he *did* actually do? It will be no harder an effort to put themselves back to his times than to put him forward into their times. If they will try to do that, they will find that he did not so much try to do "right" as to do what would best help the people. That is, his life consisted in perfect self-forgetfulness in the effort to dissipate the mental darkness about him, an effort resting on compassion. What the Cleveland aspirants should do, in the attempted imitation, consists rather in the development of a state of feeling than the pursuance of a set of necessarily forced and artificial acts.

What Jesus *had done* was to find the "Father in secret"; the first thing in right imitation of him is therefore that same finding. Then only can the spirit of his life be realized and carried out.

An old Indian book says:

In meditation the wise man perceives in his heart a certain wide-extending awakening, the divine Reality. Through intending the inner mind to this, gain thou knowledge of thy God. Sever thy stained bonds and effortfully make thy manhood fruitful.

Efforts to arrive at a particular standard of conduct must be the expression of deeper efforts to reach a standard of *being*. Within us all is a hidden center of consciousness which is that standard of being. Progress, to be permanent, is turning the outer ordinary consciousness inward.

The Teachers are those who have joined themselves to this "wide-extending awakening," the Reality in life; and then they know what to do for the world. STUDENT

The Etruscans—A Theosophical Prophecy Fulfilled

THE law which governs the appearance of civilizations is cyclic; great civilizations rise and fall; barbarism both precedes and follows civilization; the history of these successive waves of civilization goes back millions of years. This is the contention of Theosophy.

To the contention that there are so few traces left of the great pre-historic civilizations the answer is made that there are innumerable traces and ample evidence; but archaeologists have only recently begun to look for them, while they themselves are continually admitting that the sources yet untapped are far more numerous than those they chance to have stumbled upon. Also archaeologists have failed to make any distinction between remains a few thousand years old and those a few hundred thousand, and have cooked dates right and left to suit their narrow prejudiced ideas based on the traditions of Biblical chronology and biological hypotheses as to the development of the human race. But it was foretold by H. P. Blavatsky that the dawn of this century would witness the admitting of many of the claims made by her on behalf of antiquity; and every day is a proof of this prophecy. Archaeologists are tapping new reservoirs of information everywhere and filling up the gaps in history in a way that most amply bears out the scheme of history as outlined by Theosophical writers.

A notable instance of this is given in what follows. After quoting what a Professor of archaeology has discovered about the Etruscans, we also quote what was said on the same subject a quarter of a century ago by a Theosophical Teacher, and readers can compare the two statements.

In a special dispatch to the San Francisco Call, from Stanford University, dated Dec. 27th, comes the announcement that Professor Hempl, of the chair of Germanic philology, has solved the symbols of the Etruscan inscriptions, thereby throwing an entirely new light on history.

History books tell us that within the bounds of Italy (excluding the more northern provinces), there were anciently four distinct races: the Pelasgians, the Oscans with the Umbrians and Sebellians, the Etruscans, and the Greeks.

The Pelasgians were those predecessors of the Greeks, whose Cyclopean walls may still be traced, of whom historians have nothing but various conjectures to offer, but who were a remnant of one of the sub-races of Atlantis, derived from the same stock as those pre-Incans who built the similar massive walls in South America.

The Etruscans, who called themselves Ras-ena, at one time possessed not only the country

Lomaland Photo. and Engraving Dept.

OLD ROCK CARVINGS LINCOLN FOREST RESERVE, NEW MEXICO

known to the Romans as Etruria, but also occupied a large portion of Liguria and Cisalpine Gaul. They possessed a powerful navy. Who they were and whence they came has always baffled conjecture. Their numerous inscriptions could not be interpreted. They have left works of art, especially decorated terra cotta vases, which occupy a prominent place in our museums.

Professor Hempl's discovery, it is said, will make necessary a complete change in the present historical view of ancient Italy. Probably its greatest effect will be in overturning the generally accepted idea that the Etruscans and the Romans were different peoples, by proving that *the Roman and the Etruscan languages were similar in all their important features, and that the two peoples sprang from the same race—that of the Trojans*. Here we have a confirmation of Virgil's story.

But there is much more to come; for, out of 8000 inscriptions, only 50 have been deciphered. The Professor is quoted as saying that ancient Italy was occupied by Greeks in the south, Celts in the north, and Italic tribes in all parts of the peninsula. The last fall into two groups—the Latin-Faliscan and the Oscan-Umbrian. Aside from these are the Etruscans, just north of the Romans; the Veneti in the neighborhood of Venice, the people in Eastern Italy who spoke what is called Old Sabellic, and minor tribes. For many years Dr. Hempl has been deciphering the ancient Germanic inscriptions written in runes; and not long ago he was able to prove that one group of these inscriptions was Burgundian, and thus to furnish information as to a great Germanic language of which we have hitherto known nothing. He observed that the oldest runes were similar to the letters used in the unread Venetic and Sabellic inscriptions found in Italy. Examining these inscriptions more carefully, he succeeded in reading them and thus brought to light *two hitherto unknown Italic languages* similar to Umbrian and Oscan. This led him to the de-

ciphering of the Etruscan inscriptions, and he found their language closely akin to the Latin.

The Etruscans were, from 700 to 500 B. C., the most powerful and civilized people in Italy. They introduced the arts and sciences and the religion of Greece, and were the means of spreading civilization all over the northern and western world. The discovery brings everything into harmony. There is plenty of evidence that Etruscans once lived on the islands between Greece and Asia Minor, as well as on the mainland not far from Troy. *Now that we know their language is closely related to Latin, the old tradition that after the fall of Troy the Trojans migrated to Italy turns out to be an echo of the real history of the Latin Etruscan race.*

President Jordan is quoted as saying that Dr. Hempl, with his key to the inscriptions, will make enormous changes in our views of the history of Greece and Rome.

In *Five Years of Theosophy*, published in 1885, and consisting of articles previously published in the *Theosophist* magazine, we find on page 267 the following:

No "traces of old civilizations" we are told! And what about the Pelasgi—the direct forefathers of the Hellenes, according to Herodotus? What about the Etruscans—the race mysterious and wonderful, if any, for the historian, and whose origin is the most insoluble of problems? *That which is known of them only shows that could something more be known, a whole series of prehistoric civilizations might be discovered.* . . .

Who were the Etruscans? Shall the Easterns, like the Westerns, be made to believe that between the high civilizations of the pre-Roman (and we say—prehistoric) *Tursenoi* of the Greeks, with their twelve great cities known to history; their Cyclopean buildings, their plastic and pictorial arts, and the time when they were a nomadic tribe "first descended into Italy from their northern latitudes"—only a few centuries elapsed? Shall it be urged that the Phoenicians with their Tyre 2750 B. C., (a chronology accepted by Western history), their commerce, fleet, learning, arts, and civilization, were only a few centuries before the building of Tyre but "a small tribe of Semitic fishermen"? Or that the Trojan war could not have been earlier than 1184 B. C., and thus *Magna Graecia* must be fixed somewhere between the eighth and ninth century "B. C." and by no means thousands of years before, as was claimed by Plato and Aristotle, Homer and the *Cyclic Poems*, derived from, and based upon, other records millenniums older? . . .

Surely if it took the barbarians of Western Europe so many centuries to develop a language and create empires, then the nomadic tribes of the "mythical" periods ought in common fairness—since they never came under the fructifying energy of that Christian influence to which we are asked to ascribe all the scientific enlightenment of this age—[to have] about ten thousand years to build their Tyres and their Veii, their Sidons and Carthagines. . . .

When the fury of critical bigotry has quite subsided, and Western men are prepared to write history in the interest of truth alone, *will the proofs be found of the cyclic law of civilization*. And so also Arezzo, Perugia, Lucca, and many other European sites now occupied by modern towns and cities, are based upon the *relics of archaic civilizations whose period covers ages incomputable.* E.

✻ The Trend of Twentieth Century Science ✻

The Missing Links of Darwinism

MOST intelligent people have shot a casual ray or two of their attention towards Darwinism this year—and then withdrawn them with a vague idea that they had better wait.

And they had. For though the reputation of Darwin stands where it did, that of Darwinism does not—quite.

There are two questions in front of a part of the theory called Darwinism: Is the process described by it *capable* of giving rise to the biological tree as we find it? And if so, did it actually do so?

In a sentence the theory is, that of the offspring of a given animal or plant pair, only a proportion can in general escape various kinds of destruction, this proportion being often very minute; that no two members of the family of offspring will as a rule be *exactly* alike—there will be as many minute variations from the parental type as there are offspring; that those which do escape and grow to maturity, becoming parents in their turn, are in a general way those whose minute divergence from the parental type is advantageous in the struggle for life. Their offspring tend to inherit the favorable variation and some minute proportion of them carry it still further. And so on, until at last the divergence from the original type is sufficient to constitute a new species.

The questions are:

Are such exceedingly *slight* variations as the theory supposes competent, in the time, to have produced what we see?

Would the utterly *fortuitous* character of the variations described by the theory account for the definiteness of the upward progress?

To put the questions the other way about:

Must it not be assumed—as for example de Vries does—that the variations are not slight but rather considerable jumps? And that they are not fortuitous and in every direction, but in a determined direction and indicative of a plan or design?

Darwinism is thus not attacked “all along the line” as some have said. It is rather questioned as to its sufficiency. *Slight* variations, for example, would usually be useless and not be conserved at all. The offspring of a brown bear, whose preservation depended on the species becoming white, would not be at all advantaged by the development of a few spots of white. Yet that is the way according to the theory, that the change occurred.

Nor does the theory account for variations that serve no purpose, getting fixed; nor for the fixing of variations that run far in excess of their usefulness. The classic *Kallima* butterfly, for example, has chosen to resemble a dead leaf with utterly superfluous accuracy. In such cases as these we can hardly avoid the suggestion of a guiding nature-consciousness which often goes too far and is by no means above making mistakes in the pursuance of a perfectly defined object.

And lastly, as a matter of fact, *Darwinian*—that is, minute, haphazard—variations have never been proved capable of doing the work

wanted of them. Professor Kellogg of Leland Stanford University remarks that “no indubitable cases of species-forming or transforming, that is, of descent, have been observed; and no recognized case of natural selection really selecting has been observed.”

We must have finally (1) considerable variations (2) in a definite direction (3) guided by a nature-consciousness towards an end, to account for what there is. STUDENT

The Plant's Laboratory

IN a paper read before the American Chemical Society, Mr. Arthur Little, the chairman of the Division of Industrial Chemists and Chemical Engineers, drew a picture of the manufacturing plant of a great German chemical firm, its area, motors, steam engines and what not. Then he says:

The plant represents the highest development which industrial chemistry has reached, but none the less it cannot produce an ounce of starch which a potato growing in the ground fabricates from water and carbonic acid gas under the influence of sunshine. True it is that this great aggregation of engines and dynamos, furnaces, retorts and stills can . . . produce certain natural products . . . but by what monstrous effort it is accomplished. In the spring the tender grass and the delicate unfolding leaves cover the whole earth with the green of chlorophyll. . . . In similar manner vegetation everywhere is fabricating cellulose . . . and not only cellulose, but all the other complex products of the vegetable cell.

He quotes Professor Wheeler, who points out that all this fabrication, for whose imperfect imitations we require so many engines and so much apparatus, is done in silence, without apparatus, and within a minute range of temperature.

We are led to wonder whether forces exist with which we are unacquainted or whether we are merely unable to control the forces already familiar to us.

Science is gradually resolving the wonder into a conviction that there is a special life-force, the active side, and servant, of the thought and intelligent plan of nature, the plan under which variations occur in the animal and plant worlds. It is the chemist in the cell, perfectly acquainted with the forces it has to use and what it wants to do with them. STUDENT

Metallic Sterilization

IT has now been found that water may be as well—and, they say, as harmlessly—sterilized by silver as by copper. An Italian chemical journal tells us that any silver salt will do, but that the chlorate and perchlorate are best. Experimentally bacterIALIZED water yielded 3500 colonies per c. c.; the same with a ten-thousandth of silver salt yielded *no* colonies; the same with a five-hundred-thousandth of silver yielded after fifteen minutes only 800 colonies, and after three hours only ten.

The silverized water is regarded as drinkable, all the silver being supposed to have gone down as insoluble chloride.

But why use these metallic methods when more certainly innocuous ones are available? The spectroscope would show the continued presence of the metals, and it can hardly be

desirable to drink copper or silver in the smallest amounts permanently. Very perfect sterilization can be readily effected by ozone, used with absolute success for the water supplied in the late war to the whole Japanese army. And it can be still more quickly done by ultra-violet light, diffused through even running water by a quartz-glass lamp and effective along a radius of four or five feet.

The very latest proposal for the sterilization of water is by mechanical shaking. It has been found that bacterialized water, sufficiently long and violently shaken, becomes sterile. The bacteria are shaken to pieces. Both light and heat do of course shake molecules, but this plan is a much grosser affair. STUDENT

Predicting Weather by Sunspots

SCIENCE is not without hope of being able to predict the weather with certainty by means of the disturbances on the surface of the sun, and claims to be able to do so to a limited extent already. It is established that these solar disturbances do coincide with terrestrial magnetic disturbances. It is said that the emission of particularly intense ultra-violet rays ionizes the earth's atmosphere, giving its upper layers a high positive potential, which induces a high negative potential in the earth's surface. The electric perturbation thus produced travels over the earth in a path determined by the resultant of the earth's axial and orbital motions and the sun's axial motion. It has long been known that the spots on the sun rotate around it with different angular velocities according to their latitude, those nearer the solar equator rotating the most rapidly. Hence there will be times when spots which have been in different longitudes will congregate in one longitude and so produce an accumulated effect. But there are many other data to be taken into account in predicting storms, such as the age of the moon, the seasons, and local influences. STUDENT

The Theory of the Greenhouse

PROFESSOR Wood objects to the ordinary theory of the solar heating of a greenhouse. At any rate it does not represent the whole or even the chief cause. This deposed theory rests on the fact that glass, while pervious to light rays, is much less so to heat rays. Solar light passes through it into the house and falling upon the walls and contents is transformed into heat. The heat rays, radiating from within back to the glass, are denied transit. So the heat accumulates.

Professor Wood blackened two cardboard boxes, roofing one with glass and one with rock salt. Rock salt is equally transparent to heat and light rays. Yet the box covered therewith reached an even higher internal temperature than the other. The same happened when, to exclude the sun's heat rays, he filtered them preliminarily through glass. His view is that the ground and contents are heated by the incident rays, and that this heat is then spread about in the atmosphere within by convection movement of the air. The contained air, unable to mix with that outside, retains its heat for a long period. STUDENT

Nature

Studies

The Monterey Cypress

PERHAPS the most uniquely American tree that we have is the Monterey cypress. It grows in a narrow, twenty-mile strip along the coast of California, by the town of Monterey; and, according to the authority of Dr. Asa Gray, is native nowhere else upon the globe. It has been transplanted and grown successfully all along the Pacific Coast, but will not live upon the Atlantic side. It grows to the very water's edge, thrusting its roots deep down through the shifting sands, and clutching at the rocks below. This peculiar property has made it invaluable in reclaiming vast areas of beach, which would otherwise be desert waste — for instance, the Golden Gate Park at San Francisco. The trees, once firmly rooted, hold the soil in place, until soil can be deposited above it and other plants well started.

The cypress grove at Monterey is an impressive sight. The trees grow sparsely, and very far apart, as though each strove to keep its own individuality. They are grotesque objects, bent and gnarled and twisted by the wind, with ashen gray trunks and branches, quite denuded of all foliage, save a matting of somber green at the very top. They are of majestic size, and their haggard, weatherworn appearance well justifies the assertion that they are centuries old. One particularly giant specimen, standing alone on a rocky promontory, jutting out into the sea, is known as the "Old Witch Tree" — and indeed many of them look like ancient witches, standing at the world's end, dashed by waves and buffeted by winds, yet forever defying time and change. There is something heroic and awe-inspiring in their aspect. One could imagine Druids performing their mystic rites under such a tree in the legendary forest of Broceliande, or the ravens of Odin resting amid its branches.

Seagulls in London

WHENEVER a rare and beautiful bird visits the country, it has been the usual thing to shoot it and preserve the skin in some collection, while the name of the man who shot it is published in the newspapers as if he had done something worth doing. That was in England.

In Japan, when a rare bird visits the country, efforts were made to attract it by feeding it and making it feel at home in the towns. Many such beautiful birds are to be seen in the cities. Is not the Japanese way better?

Some years ago there was a very severe winter in England and the seagulls were forced to come up the Thames inland as far as London to seek for food. The great white birds, hungry and frostbound, appealed to the Londoners, and they were fed with all sorts

THE OLD MILL, IFFLEY, ENGLAND

TO A VILLAGE STREAM

ONCE more, sweet Stream! with slow foot wandering near,

I bless thy milky waters, cold and clear.
Escaped the flashing of the noontide hours,
With one fresh garland of Pierian flowers
(Ere from thy zephyr-haunted brink I turn)
My languid hand shall wreath thy mossy urn.
For not through pathless grove with murmur rude
Thou soothe the sad wood-nymph, Solitude;
Nor thine, unseen in cavern depths to well,
The Hermit Fountain of some dripping cell!
Pride of the Vale! thy useful streams supply
The scattered cots and peaceful hamlet nigh.

Coleridge

so much hunger in hard times in our great cities before we can realize what it means to want a meal.

A.

X-Rays in Pearl Fishing

IT is not science, but the selfish motives that exploit it, that cause waste and destruction. Science often prevents waste. As an instance, x -rays have recently been applied to check the enormous waste in pearl-fishing.

The usual method is to dredge up the oysters, open them, and set them aside to rot. After they have rotted, the flesh is washed out and the residue examined for pearls. This means that all the oysters without pearls are killed for nothing; that innumerable seed-pearls, which would have grown into large ones, are wasted; and that great inconvenience and even epidemics are caused by the effluvia of the rotting.

All this has been prevented by the discovery of a man who has applied x -rays to the industry. He has the oysters put in batches of a hundred into troughs. These are taken to the x -ray room, where sixty batches can be photographed in less than a minute. Thus those having pearls are discovered, and the rest are thrown back into the sea.

As our civilization advances in the study of true fundamental laws that govern life, we shall learn to make natural science our handmaid, always doing us service instead of leading us into trouble as is often the case with our present way of doing things.

T.

Students'

Path

A Higher Civilization

THE thoughtful student of the puzzling problems presented by our modern civilization, does well occasionally to divert his attention from the consideration of these problems in their confusing detail to the great aims and ends of the deeper undercurrents of which the boiling surface is not always a faithful reflex. The old, old question, *cui bono?* what is the good of it all? comes ringing down the centuries, echoed in the poetic dreamings of all literatures, in the rise and fall of schools and philosophies, in the paradoxes engraved upon the lives of the illustrious, in the disappointed ambitions of men and nations. All these have found a limit and a tomb in the surge of advancement and in the waves of time.

Again and again it would seem that man has almost attained the heights, but again and again he falls back and, as asked by one writer, the question arises:

Is it impossible to make a guess as to the direction in which our goal lies? Could we go back throughout history intelligently, no doubt we should find that this question came always with the hour when the flower of civilization had blown to its full and when its petals were but slackly held together. The natural part of man has reached then its utmost height; he has rolled the stone up the Hill of Difficulty, only to watch it roll back again, when the summit is reached—as in Egypt, in Rome, in Greece. There is one summit to which by immense and united efforts he attains, where there is a great and brilliant efflorescence of all the intellectual, mental, and material part of his nature. The climax of sensuous perfection is reached, and then his hold weakens, his power grows less, and he falls back through despondency and satiety to barbarism. Why does he not stay on the hilltop, and look away to the mountains beyond, and resolve to scale those greater heights?

There have always been those who have known the answers to these questions, and have proclaimed their gospel at the great crucial cycles of the world's necessity. Their knowledge has always been derived from the one source, the Secret Doctrine of Ancient Wisdom, which is man's inheritance, founded not upon speculation but upon the realized and actual knowledge of man's inner being and divine possibilities.

This teaching which is identically the same as given by all the founders of religions, and in all the greater philosophies, is that the cause of ruin and downfall, of death and destruction is the cultivation of *self-interest, self-indulgence, selfish aims, self-glory*. The way of exit from the road to ruin and death, is *disinterestedness, altruism, a wide sympathy for others and a self-identification of one's self with one's fellow creatures*.

The student who would pursue the intellectual facts, upon the reality of which the absolute necessity of this moral system is based, may find them in *The Secret Doctrine* of H. P. Blavatsky. And he who is convinced

of this necessity, either from that source or from any other, will find its realization within himself, by a search into his own nature, and by a wise and sympathetic study of his fellow-men. Herein he will discover that there is a potentiality of a higher and a nobler life, springing from a suppression of self-interest. From this arises a knowledge of man's innate divinity, common to all men, and identical in each one.

Thus a higher civilization will spring from a united acknowledgement by all men that there exists a higher good which men have not yet experienced, either individually or as a whole. This present ideal must be seen before it can be made an actuality. Wherein does it lie? It lies in the clearing away of self-interest, which is the source of evil in the world. It lies in the public and private recognition of the absolute necessity of renouncing self, and rejecting the pursuance of personal aims, if any progress is to be made.

One of the reasons why this great ideal is not more recognized is a strange distrust of the universe in which we find ourselves. Nearly everyone has, from earliest childhood, imbibed the idea from the thought atmosphere around him, that he was a little Ishmael whose every step in life was surrounded by a combative competition, a struggle in which his brother men were the opposing forces. The object to be attained has seemed hazy enough. It might be one or more of many personal aims. But the one ideal was, somewhere or somehow, to be on top. Behind this effort was a scarcely recognized yet ever present and very powerful and real notion that if we did not do this there was no power to care for us or look after our welfare. This is one of the greatest delusions of the present black age. There is little or no belief in the Great Law of the Universe as a protecting agency. And yet study will reveal that if we were not, by habit and education, so deeply convinced that there is nothing in which we can trust for guidance in this awful, writhing scramble for self-interest, we should soon find out to our great relief and joy that the teaching of the ancient sages was true—that not a sparrow can fall without the knowledge of the Father. We should fall back upon a divine confidence that if our duty, as demonstrated within by the light of conscience, were always followed we need "have no thought for the morrow." Yea even, that though we made mistakes in our daily stumblings, they were all provided for and might be made stepping-stones to knowledge. Either the great divine law of mercy and justice is true and real, or it is not. If it be not so then the whole universe is a mockery and a delusion; but if it be true (and we can readily convince ourselves of this basic fact) then we may trust it to the uttermost.

But men do not do this and they fight in vain for an illusive self-interest. National armaments are increased in a positively insane craze for self-protection, by nations which cannot even formulate what they fear, or what they are protecting. The sacred offices of the public administration of the rights of citizens are eagerly sought in self-interest, and are bought and sold in the shambles of a shameful graft. Private outrage and brutality are met by public and official outrage and brutality under the false disguise of remedial

measures. Should desirable laws be proposed, tending to alleviate distress or promote moral reform, they are seldom discussed from the light of a pure humanitarianism, but are first made to pass through the test of the almighty dollar as a guide to their desirability. Either these conditions must be changed or no higher civilization is possible. Our civilization has flowered and it must bear the fruit seed of a newer and a higher and nobler one, or death will come to the nation and we shall pass into the list of decadent peoples which have strewn the pages of history with warnings for future humanity. STUDENT

The Value of Theosophy

THE particular and peculiar value of Theosophy is that it awakens a man to his responsibility, it makes him question and think for himself, and by so doing he finds a fund of unsuspected energy, a depth of feeling and a power of thought and action hitherto latent and undeveloped within himself. Perchance then he remembers the words of one of the Great Brotherhood of Compassionate Helpers of Humanity, "the kingdom of heaven is within you," and the wise advice of a present day Theosophical book: "for within you is the only light that can be shed upon the path. If you cannot perceive it there, it is useless to look for it elsewhere"; showing also that Truth is One, in whatever age it may receive expression.

At the present time the truths of the old Wisdom-Religion are being given out in greater volume to the world than ever before; the Sower has scattered the seed broadcast, the golden grains of Divine Wisdom about life and death, and how to live our lives to the best advantage for all—in a word, how to *grow*. For true evolution is growth in knowledge, growth in love; and these two should be eternally hand in hand; true evolution is expansion from the contracted point of interest in one's *personal self* to the larger interests of others. Humanity as a whole being a Unity, each of its units has relations with all other units, and the Heart and Essence of all is *one*, "in whom we live and move and have our being."

Is it not better to feel oneself a Being of Light, than a worm of the earth, a creeping crawling, downtrodden clod of clay? True, we are double-natured, angel and fiend, manifesting the powers of either according to our will; but the lower tendencies are of material existence, the higher are of our Immortal nature. These two, "light and darkness, are the world's eternal ways," taught the Wise Ones of old; but the *true* self is "the self of all creatures," and therefore can control and master the lower forces, and must eventually do so if he would regain the position he held before the "cycle of necessity," or reincarnation, into the flesh began.

The value of Theosophy lies in the fact that it tells us plainly the truth about ourselves, and what to do to make "life worth living," and what *not* to do to escape misery and sorrow; giving us a conception of our "true dignity" as human souls. Teaching as it does the great laws that govern human life and evolution it gives us the chance to become conscious co-workers with nature in the grand march onward towards perfection. The gates that lead to the kingdom of Light are again open to whomsoever will enter in. W.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question Why are there all the inequalities that we find in life? I do not mean that it is expected that all should be alike; but have we not all the right to life, liberty, and happiness, as well as freedom of conscience? It is plain that legislation cannot give it. But why do so many good people suffer when the bad, the evil-minded, often have everything one could wish for?

Answer These facts, that you mention, ought to make everyone determine to unravel the truth about things. If materialism were right, and we were all weltering here by chance, and there were no ruling nor order nor soul of things, then universal suicide would be almost a duty; it would be abominable to live on in such a ghoulous iniquitous nightmare of a world. But we know very well that we can make things better; that instinct is inborn in us; on the whole we fall short of such cowardice as to be content to leave things as they are, and imagine we can make nothing of them. There is something in us which will have its say, and hope is the last thing we abandon. It is that something which belongs to a higher state than this material world, and gives the lie to all the pronouncements of materialism. Let us turn our attention to this then, and find some light within ourselves.

Earth cannot answer, nor the seas that mourn
In flowing purple of their lord forlorn,
Nor rolling heaven with all his signs revealed
Or hidden in the sleeve of night and morn.

Suppose all troubles are poured out upon you, and you knowing no why nor wherefore for them: is there not something in you which might rise up—perhaps does not, but still, *might*—determined to be valiant, and fight a way through somehow? Many a weak one, it is true, goes to the wall, apparently, and is no more heard of; but many another discovers unexpected qualities, and fate finds a lion, where she dreamed only to rouse a hare. There is then, some fountain of heroism in man; never mind that there is a fountain of foolish weakness too, that is beside the point; it remains that there is this something that can be brave. Brave in spite of bodily frailty; therefore it is not the body: brave too, in spite of a dull mentality; therefore it is not the brain. There is a soul in man; that is the pivotal fact in the whole scheme of things. There is a divine center, of which he, in the stress of getting through his days and attending to the behests of his desires, very generally knows nothing or next to nothing. It is superpersonal, and neither mind nor passion. It speaks out suddenly at times, with ancestral majesty and wisdom; there is no limiting the compassion that may flow from it; there is no conquering nor impelling it with all the forces in the world.

It is no use to argue that the men who showed these qualities were great exceptional characters and that we others are not like them, were not made in the same mold, and cannot approach their splendor. The difference is actual, not potential; seeds of the same grandeur are in the least of us, would we use the will to make them sprout and grow. Let us then admit the soul, and its curious relation to these personalities, which are so near it as to be its mask or garment, and so far away as only to catch now and again a word of its

perpetual encouragement and remonstrance and advice.

Now could you twist yourself round so as to take the standpoint of the soul that is within you, would you still cry out against the injustice of things? What does the soul say, when the body is in pain, or when someone has done you wrong? *Here is the opportunity for splendid courage*, it says; *here is the grand occasion for magnanimity*. The soul is out of the dawn of creation, and all time and manifestation are the field of its adventures. What went it forth for to see? The pageantry of innumerable worlds, the efflorescence of the universe and evolution. But most it went forth to measure its strength and majesty against the conglomerate forces of chaos, rebellion, confusion. There was pain there to be reaped, and the soul said: *I shall never be rich until I have known the full meaning and value of pain*. It saw there the wide and only field in which might be sown the seeds of beauty, and was not hesitant to take the risks. Its royalty was to be soiled, and heavy oblivion was to encumber it about; all this we may conceive that it foresaw, and yet went forth for the sake of the divine work that it might do.

Theosophy would have us perceive that when trouble comes upon us, then in a real sense we should rejoice; for it is then that we may be in the forefront of the battle, accomplishing something of our ancient purpose, or undoing some of the mistakes we have made on the way. Infinitely far have we journeyed; innumerable times we must have failed and wandered from the road. We have become entangled in the confusion of worlds and ages; but ought not to regret this so long as we are at work, at work, at work!

Two men may go out into a new country, and the one will starve for the lack of perfect tools and materials, never doing anything because the paraphernalia he is accustomed to are not at hand. The other will get to work with whatever stuff there may be lying round; rig up some kind of shelter; force wild material day by day to unwonted uses; make bad a little better, rough a little smoother; never lay down his axe and fortitude and struggle;—and be the founder and forerunner of a civilization. While you are in contact with matter, rely upon it that there is still work for you to do, and the eternal purposes of manifestation to be fulfilled. You are not here for your own sake; and the attainment of happiness is not the end. Work is the end for us, work and warfare; and in these things is the soul of sweetness; nobility and victory are comprehended in them; it is only a coward and listless race that accounts them bitter. Riches and pleasure and knowledge may be withheld from us; but of one thing we are never robbed—opportunity to do service.

So may good people suffer then, often enough, because they have earned the right to stand up face to face with all that hinders our evolution, and need not to dawdle in the rear ranks and behind shelter. They have earned the right to undo the wrong they may have done, and to learn wisdom.

If men understood these great facts—Karma, or that we arrange our own fate and suffer nothing unjustly; and Reincarnation, or that we are not babies, but as old as the worlds, life would be without its maelstroms

and cesspools and treacherous places. There would still be honest pain and trouble, until perfection were attained; but there would not be this cloud of uncertainty, of doubt, of rebellion and longing and regret; we should at least get to work whole-heartedly and force things along the way they ought to go. K.

Answer II. Is it correct to say the bad, the evil-minded, ever have everything one could wish for? One saying this surely has not taken all the facts of life into account. Do they have those things which alone are worth wishing for? Do they have the deeper knowledge of life, the serenity, the true love and friendship of their fellows, the whole-hearted trust and confidence of children, the power to bless and serve their fellows? Do they have any of these things which alone make life worth the living? and if not, does not the question appear in an entirely new light?

May it not be that because each of us among the ordinary run of humanity has in his nature something of evil, some badness, selfishness, and that each of us is to a very large degree ignorant of the true purposes of life, or if indeed we glimpse them, we fail to act whole-heartedly in accordance with them, that therefore we suffer?

If we had no weaknesses, no evil in our natures; if we had completely conquered *self*; if we were truly *good* and wise; would it be conceivable that we should suffer? Surely not—that is for ourselves. It is not conceivable. But there is another fact, the central one of the teachings of Theosophy, and that is, we are a part of the human race, and cannot separate ourselves from it, for the solidarity of the human race is a fact. And we come to realize that we must help to bear our brother's burdens, we must suffer with and for them, we must realize that their burdens, and in a great measure their responsibilities, are ours.

Yes, all are entitled to life, liberty, and happiness, but all are free to accept them or not. But life, the real life, the life of the soul, has no part in what many call life, the gratification of the impulses and passions of the lower nature. And but a little thought will show how we have forged our own chains, have bartered away our liberty for a mess of pottage, and ourselves sown the seeds of our present unhappiness.

The Theosophical teachings of Karma and Reincarnation give the key to the whole matter; we are what we are because of our past thought and action; but it is also in our power to make ourselves what we will by virtue of the omnipotent divinity that is in the heart of each.

Shall we then become equal when we realize our divinity and the power that then will be ours? Is the hand the equal of the eye? or the heart of the brain? Is one cell of the human organism the equal of another or has it the same identical function? Surely it is not equality we should strive for or desire, but harmony, each to play his part in the great drama of life. In a perfect orchestra, as in a perfect drama, each instrument, each part, is essential, not one can be omitted, and each shares in the glory of the whole.

"Nothing is small, nothing is great, in the divine economy."

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

The Religion of the Future

A PROFESSOR of the philosophy of religion, a Baptist, has recently preached a sermon, part of a forthcoming book, in which he maintains that Christianity will die but the world will grow better.

Christianity, he said, may die, as other religions have died; but the world will be more Christian than it is now. Jesus, if on earth, would pursue a different course from what he did before; he always faced forward and said nothing about the golden ages of the past. If he walked on earth today, he would turn away from dead dogmas, injurious survivals, meaningless customs, and moribund churches, and make a new future, recreate life, and release the spirit.

The new world, inner and outer, could not be ours as a gift, even from him. In the nature of the case, we must make it ourselves. And we are not in a position to deny that we could do this, even should science conclude that he never lived at all.

After the name of Christianity has been utterly forgotten, continued the preacher, the world may be more thoroughly Christian than it is now; have more faith, hope, and love; be more sure of a fatherly God, of a brotherly man, of an eternal life, of a purposeful world. The stream of spiritual influence may continue to deepen and widen, even though the springs of Judah be forgotten. Whatever be the fate of the individual Jesus, no man is justified in making shipwreck of his faith in the preciousness and permanence of our values.

To take some poor man who is blind and knows it not, and open his eyes that he may see in the deep of his own soul those invincible forces of life that would press up into the light—that would be a true miracle. Snap the fetters which bind you to dead customs and slaveries; have the courage of your own convictions, and you have set a captive free! Harken not to public opinion so much as to the quiet unexpressed voice of your own heart and conscience, and you have made the deaf hear, the outcast to be clean, and the dead to live.

Now most of this is excellent Theosophy; let us sum up the points.

The word "Christianity" is used in two senses: firstly, to denote the present order, which passeth away; secondly, to denote the true Religion of Self-knowledge which endureth.

Jesus was not a creator of immovable dogmas, nor a reviver of past traditions, but a Teacher of the eternal Religion, urging men to gain for themselves self-knowledge and

MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

using such means of arousing them as were adapted to his times. If he came now, he would not try to revive the dogmas of ecclesiastical Christianity, but would strive, as before, to awaken men to a recognition of their own fundamental divinity; and he would, as before, utilize contemporary methods in achieving his purpose.

Even Jesus, however, cannot endow us with "the Kingdom" as a gift; we must find it ourselves. Yea, even though Jesus never lived we can make it; for there have been other Teachers, and (apart from all Teachers) it is a fact.

So we must set ourselves free from forms and customs in belief and see in the depths of our own Soul the eternal forces of Light and Life.

This is Theosophy; but how about ecclesiastical Christianity? The preacher, in a part of his sermon not quoted, makes use of the parable of putting new wine into old skins. May this not be applied to his own case? What are his teachings but the new strong wine, and what are the churches and their creeds but the old skins? And what is the result of putting new wine into old skins? That the wine bursts the skins and is spilled. Then where shall we find the new skins, of pliable material, that will hold the strong new wine?

We must look, of course, in answer to this question, for a reorganization of ecclesiastical machinery and a recasting of creeds; for the old ones will not stretch enough. But how this is to come about, it passes ordinary foresight to see; and one can but anticipate many changes, temporary makeshifts, and conflicting authorities, until such time as the mass of the people have attained enough light to be able to know what they want and to recognize their Teachers. Then we may have churches constituted on a basis of merit, with pastors whose position depends upon their actual ability to teach and help. Instead of dogmas, appealing to the instincts of fear and selfishness, we may

have teachings which will evoke in man self-reliance and arouse his intelligence. Preachers in the pulpit, and priests at the hearth, will no longer be warning us against the use of our own intelligence and scaring us with threats of incurring the anger of Deity; nor will they use their great influence and hypnotic power to constrain our

actions, whether for good or evil. Instead, they will be reminding us of the invincible might of our own Divinity, urging us to appeal to our own sense of right, explaining to us the sublime teachings of the eternal Wisdom-Religion as recorded in the world's ancient scriptures, assuring us that Divine Law is infinitely just and merciful, banishing the fear of hell and the selfish desire for a sensual heaven, telling us that death is but a rest for the tired Soul after its earthly battle, and that the Soul will be reborn with fresh joy and vigor for another and brighter life on earth. Whether there will be churches and ministers must be left for the future to decide; but, under the conditions we are imagining, there could be no authority resting on a false basis or maintaining its hold on the people by practising on their hopes and fears.

Until the people are more enlightened, there will of course be room for claimants of all kinds; and we cannot expect that the evolution of the new order will be unattended by strifes and delusions, as has ever been the case at such crises. When a real Teacher appears, his authority rests on his qualifications, and his power is not arbitrary. But the people must have made it possible for such a Teacher to appear. The spirit of Theosophy must be diffused, and people taught to seek the Light within and to believe that enlightenment will come through following the highest ideals of righteousness, justice, purity, and mercy, which they can find in their hearts. The dogmas and speculations of ecclesiasticism and modern science must be supplanted by the rational helpful explanations of Theosophy which find their proof in the fact that they actually clear up the problems of life and nature.

The bold admissions of this preacher are also interesting for what they lead to. Take the missionary problem, for instance; what bearing do they have on that? It is evident, that if this brand of Christianity were what we carried to the heathen, the heathen would

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

BEFORE a most attentive and interested audience in Isis Theater last Sunday evening, Mr. Kenneth Morris lectured on the subject "Hard Facts." In his opening remarks the lecturer referred to the two distinct tendencies which are to be found in all art and literature and in life itself: one towards things as they are, or realism; and the other to things as they might be imagined to be, with all the dark side taken away, which we call idealism. But, said he, this distinction is false, because it is we who make things be; the whole world flows out of our thoughts, and we are its creators.

True Realism is the only true way. Whatever is not earnestly true, has no value of its own. We are in this world, governed by laws infinitely more lasting than our power to break them. Realism would be to base our lives on *reality*, to live in accordance with the laws of Being.

What is law? It is the method by which things take their course. Yet we are wholly befogged as regards the world of ourselves. We have not inquired closely or intelligently into the laws that govern life. Let us have facts, hard, sound, reliable facts; let us see to it that the ground we are standing on is *terra firma*, and will last. The cry of the world is for reality.

Let us picture to ourselves civilization as it ought to be. There ought to be no human wrecks; no miserable, mean apologies for men and women. What do we mean when we say "a real man"? Men and things are as they are, not by any law of nature, not of any inherent reality, but because we have lost sight of reality and gone in for bad dreams—because we have built our house upon the sands, and the foundations are all sapped, and the walls cracked and rocking.

We need Theosophy to remind us that all that ever was in the soul of man is in us also potentially, and waiting to be developed and called into action. That is the very hardest, soundest, solidest fact of all the facts that surge around us through life, and the one we most persistently ignore. Facts; hard, solid facts! For the love of man, let us have facts, and the Gospel of Facts, which is Theosophy, and something on which we can build a permanent structure. The indissoluble fact and truth is that the world was never intended for a place where one might acquire things for one's own enjoyment. The soul, whose birthday was the dawn of time, has a different mission, and different standards of what is to be desired. "Life is Joy," says Katherine Tingley, meaning this uplifted life of selfless endeavor, for truly the other kind of life is anything but joyful. Surely it can be easily seen that were we once divested of the fret of personal aims and desire and ambition, we should taste, as Theosophy affirms we ought to taste, the wide freedom of the soul.

There have been Christs and Buddhas in the world; that is to say, the soul of man when you uncover it, and let its light shine forth, is godlike and all-embracing in its beauty and compassion. There have been Maids of Orleans, and Garibaldi; that is to say, the soul of man is so mighty in its fortitude that even if the whole world be set against it, it shall not weigh down the scale. OBSERVER

The Religion of the Future

(CONCLUDED FROM PAGE 10)

listen to us with greater respect; but we should not be justified in supplanting the heathen's creed by our own, for have we not admitted that the creed is naught and the spirit everything? We should have to take the heathen's religion and interpret it for him, and join with him in the resolve to seek the light within. Nor could this kind of religion serve in any way to bolster up an establishment; for such establishments rest upon claims to be the hereditary custodians of a Divine charge, whereas the new religion waives all such claims and rests solely upon the light within.

If there is to be a new organization of

stand by an analogy what the Chinese think of their great Teacher Confucius: "What the Holy Sepulcher was to the Crusaders who went against the Saracen hordes is the tomb of Confucius to the Chinese."

Once more the missionaries are endangering our relations with China, are even endangering the relations of every Western power with China, risking an outbreak of feeling against what the Chinese regard as a desecration. The outbreak will mean a river of blood, retaliation on the part of the Western powers, more blood, probable thefts of Chinese territory, a forced indemnity, and a burning sense of injustice which will now take at least a generation to disappear. In defiance of the

PARIS AND THE SEINE.

religion—and nothing can endure in this world without organization—it must grow from within rather than be imposed from without. And, as more and more people come to recognize that the interior light is the one and only eternal bond of union and common factor for humanity, that organization will take shape as a new spirit of solidarity more binding and sacred than any enactment.

It is the aim of Theosophy, and of all who (consciously or unconsciously) are working for that cause, to evoke in humanity this new solidarity, by striving to render them aware of the fact of the common bond—the inner Light. Then the people will of themselves throw off their bonds and be free. STUDENT

The Missionary Again

PROFESSOR Hirth, who for many years lived in China, who understands Chinese feeling as well as any man in America, and who is now head of the department of Chinese language and literature at Columbia University, has been trying to make us under-

universal feeling of the native people some American missionaries have purchased property for a mission near the tomb of Confucius. Hence the remark of Professor Hirth. The Chinese government has cast the vendor of the property into jail.

Dr. Hobart, speaking for the missionaries, says:

We have here in Shan Tung a wide open door and we ought to go in and possess the land. Within the limits of our territory all the sages of China, from the great Yoa and Shun, down to Mencius, lived and died. This is the sacred land of China. . . . Our central station is at Tai An, which nestles at the foot of China's sacred mountain.

One would think that the gospel preached by the missionaries had been so transcendently effective in the West that nothing more remained to do. Our alcohol bill, ever rising; our suicides; our crimes of violence; our vice; our divorces; our child-labor; our gigantic total of preventable calamities; our four millions in abject poverty; our roll of morphine and cocain victims—together with, on their

own showing, our emptying churches and pulpits — all this may be left to the visibly failing agencies that are trying to combat it while the missionaries endanger the world's peace possibly, and a nation's goodwill for a generation, certainly. Why do we permit it? C.

Swedish Cavalry Signals in a German Town

DR. BITTHORN of Berlin has published a delightful little book about the Swedish cavalry signals which are sounded on a bugle every Saturday forenoon from the Tower of Delitzsch by the city band. Delitzsch is a small town with 9000 inhabitants in Saxony, not far from Leipzig. Every Saturday there is a busy market, but exactly at ten o'clock business stops and everything is quiet, for then a cavalry signal is heard from the city tower, followed by another still more powerful. A stranger wondering what is going on receives the information: "It is the old Swedish cavalry signals."

In the first days of November, 1632, five Swedish horsemen — one officer, one trumpeter, and three men — rested in Delitzsch after a long and difficult journey. They were coming from Stralsund to carry important dispatches to King Gustavus Adolphus. Before they had time to leave the town a detachment of the Emperor's infantry with two guns appeared and summoned the citizens to surrender. They were ready to open the gates to the enemy, when the Swedish officer saved Delitzsch by his presence of mind and resolution. He ordered the trumpeter to hasten to the tower and from there to blow the Swedish cavalry signals as powerfully as he could. In a few minutes the Swedish signals, which the Emperor's troops had learned to fear at Breitenfeld and other battlefields, were heard from the tower. The enemy imagined that the town was occupied by the Swedes, lost their heads completely, and retired as quickly as possible towards Lützen. This happened on a Saturday at ten o'clock. In gratitude to the Swedish rescuers the Swedish cavalry signals have sounded every Saturday at this time during the 277 years since. The signals lived only in tradition, but Dr. Bitthorn has written them down and gives them in his book. P. F.

Poisoned to Death by Worry

AUTO-TOXIC poisoning is the name given to a rare disease. An instance of it lately described in the papers, is the case of a woman who grieved deeply over the loss of her husband, whose terrible death at sea she had witnessed. Her case was at first supposed to be epilepsy; but the doctors found that it did not answer the symptoms, while the symptoms did indicate poisoning. Hence it was inferred to be self-poisoning by grief.

It will occur to many that this disease differs rather in degree than in kind from many other diseases, which are also cases of self-poisoning, though they may have other names as well. This particular case did not answer to the symptoms of any familiar disease, and so all they could do was to call it what they did. But worry is a well-known cause of disease, which from acute may become chronic; and mental states are probably accountable for a larger share in causing diseases than are physical conditions. In fact the slightest wrong thought poisons the body to some extent. So we poison ourselves. T.

International Atomic Weights

SCIENTIFIC readers of the CENTURY PATH may find it handy to have the following in print where they can readily refer to it. It is the values adopted for 1909 by the International Committee on Atomic Weights.

Ag—Silver	107.88	N—Nitrogen	14.01

Telegraphing Direct from London to Rangoon

THE greatest feat in long-distance telegraphy has lately been performed in London, messages being sent over 7700 miles of wire without retransmission. The lines belong to the Indo-European Telegraph Company. They run from London to Lowestoft, the most easterly town in England; across the North Sea to Emden, in the north-west corner of Germany; overland through Berlin, Warsaw and Odessa to Kertch, in the Crimea; by cable across the Straits of Kertch; overland through Tiflis and Tabriz to Teheran; all which makes 3800 miles. A new section carries the line to Kurrachee, making 5374 miles. There were ten automatic repeaters between London and Teheran, and three more to Kurrachee. Messages were sent direct at an average speed of 40 words per minute. Subsequently other sections, also having automatic repeaters, were added; and Madras and Rangoon (Burma) were respectively connected up with London, making 6900 and 7700 miles.

The death of the late Shah was known in London two minutes after it was announced in Teheran. H.

Suppression of Eclipse Ceremonies in China

ANOTHER picturesque bit of local color has been demolished! The Chinese ceremonials, and the letting off of fire-crackers and the banging of gongs, for the alleged purpose of driving off the dragon that

tries to eat up the sun at the time of a total eclipse have been a perpetual source of amusement to the rest of the world, and it is with a sigh of regret that we hear that this quaint old-world ceremony is to be discontinued, in deference to modern ideas, by order of Prince Chun, the Regent of China, who believes it is founded upon nothing but superstition. The more conservative members of the imperial board of astronomy are aghast at the Prince's iconoclastic ruling, but they have the satisfaction of knowing that if the sun is annihilated at the next eclipse it won't be their fault.

To the student of astronomy it may seem remarkable that the wiser intelligences of China, who have kept accurate astronomical records for thousands of years, and who have always been able to predict the coming of the eclipses, have allowed the uneducated people to believe the dragon story literally. But the question is not so simple as it appears.

To the ignorant mind, and, to a degree, to the well-informed, a total solar eclipse is no joke. To see a piece apparently being bitten out of the sun by an invisible foe on a cloudless day, and for the luminary to be completely blotted out at last, leaving nothing but a few shreds and patches, is a thrilling experience for anyone. A total eclipse is accompanied, also, by many other unusual circumstances — the chill in the air, the black shadow rushing across the country towards one at appalling speed preceded by the color bands, the bursting into view of the corona and the rosy "flames" round the place of the vanished sun, the appearance of the stars, and the uneasiness among animals. We can hardly wonder that the attempt to drive off the invisible intruder by loud noises, when once started, was not discouraged by the wiser heads, for it must have been an excellent safety valve for the panic aroused by the rare phenomenon. Possibly, too, there was a deeper cause in the ceremonial observances held at such a moment, which has now become hidden, leaving the old custom without an interpretation. Anyway it is to be hoped that the mass of the Chinese people will be fully informed of the cause of eclipses before the next takes place, so that there will be no rioting.

It would be an interesting thing to know how many fairly educated persons in Western countries could give a clear account of the cause of eclipses, and of the difference between solar and lunar ones. R.

If Claudius were at Paris and Johannes at Rome, and one wished to convey some information to the other, each must be provided with a magnetic needle so strongly touched with the magnet that it may be able to move the other from Rome to Paris. Now, suppose that Johannes and Claudius had each a compass divided into an alphabet according to the number of the letters, and always communicated with each other at six o'clock in the evening. Then (after the needle had turned round three and a half times from the sign which Claudius had given to Johannes), if Claudius wished to say to Johannes "Come to me," he might make his needle stand still or move till it came to c, then to o, then to m, and so forth. If now the needle of Johannes' compass moved at the same time to the same letters, he could easily write down the words of Claudius, and understand his meaning. This is a pretty invention, but I do not believe a magnet of such power could be found in the world.

The above is from *Deliciae Physico-Mathematicae*, a book published in 1636, being quoted therein from an unnamed earlier book.

Art Music Literature and the Drama

"Slaves of Superstition"

HERE is a short article with the above heading in the *Youth's Companion* of February 11, 1909, which is very misleading. It is a criticism of the "broad-minded students" who believe that each religion is best fitted for the people to whom it was given, and states that "over against this easy theory, the honest student of civilization must put the facts as to other religions." The only fact to which attention is called is the terrible practice in India of burning the widow on the bier of her husband, which has been stopped by the British Government. In view of this, the statement is made that a religion which teaches such a revolting superstition cannot be classified with the religion of Divine Compassion—in other words, Christianity—upon which latter devolves the duty of overthrowing this ignorance.

In reading such an article there are several reflections that an ordinarily fair-minded person would make, whether he be "broad-minded" or not. An unprejudiced student of the religion of the Hindūs would easily discover that the practice referred to is in no way a teaching of their religion, but a custom grown up long after their religion was given to them, when its higher spiritual interpretation had been lost sight of, and attached by them to it. Would the same critic care to hold Christianity responsible for the Inquisition?

Superstitions in the name of religion can be found in every creed, and gross vices are to be found among every people. It would hardly be fair to lay the blame of the corruption, selfishness, immorality, and greed prevalent throughout the Christian civilization, to the teachings of Jesus.

There is another way, besides converting, of recalling the nations to themselves, and helping other races to overcome their degrading superstitions. It is the method which has been employed by Katherine Tingley in her Crusades around the world, and a method which, when applied, has been real and positive in its good effects. It consists in awakening each race to the *beauty and power* of its own religion; of stirring the souls to see their religion in its purity; to live according to its light, and to throw off the dross of superstitions. But to do this universal work requires some one who is universal in sympathies, and

great enough to perceive the Source from which all these religions have sprung. Those who gave them to the people were certainly more capable of judging of the people's needs, than are the flock of any particular shepherd.

STUDENT

What Am I Thinking About?

A person can have no attachment for a thing he does not think about, therefore the first step must be to fix the thought on the highest ideal.—*William Q. Judge.*

WHAT am I thinking about? What is the thought that crowds all others for space and time? Is it of criticism, personal comfort, luxury, advancement? Suppose it to be the first named, what is the sum-total of an ordinary day's fault-finding?

upon this point, the world goes hourly astray in clashes, crashes, feuds, thefts, murders, and the like. Through an understanding and following of Theosophic guidance here, a happy way opens out of even the *worst possible conditions*.

In the moment of wrong thought, the Warrior may be summoned to lift it away from its fault-finding into a charitable wish—into the acquirement of a few new words in a foreign tongue, into a careful repetition of a pure poem or of a multiplication table—into just as high and sweet a place as it is possible to raise and keep it, until the irons that were fetters *do* become swords, with which to set oneself free.

Mr. Judge wrote further on this point:

Friends, the struggle for the Eternal is not the daring deed nor yet hundreds of them. It is the calm unbroken forgetfulness of the lower self for all time. Begin it now on your present plane. You have within you the same guide that the Masters possess. By obeying it they have become what they are.

D.

A Word about the Orchestra

IN 1898 (now eleven years ago) the Dresden Court Orchestra celebrated its three hundred and fiftieth anniversary, a statement that reads with astonishing effect in these days when so many look upon the orchestra as a comparatively modern departure. This orchestra, when established by the Elector Maurice, was virtually a singing choir, instruments being used for accompaniment only.

It soon grew into an orchestra, however, and assisted at the production of the first German opera, Heinrich Schutz's *Daphne*.

The Leipzig Gewandhaus orchestra was organized in 1743 with sixteen players and its first concerts were given in private houses. Mendelssohn was for eight years its conductor, and after him the composers Gade and Reinecke. Schumann wrote of it:

Before we take leave of the Gewandhaus concerts for half a year, we must award a crown of merit to the forty or fifty orchestral members. We have no solo players like Brod in Paris or Harper in London; but even these cities can scarcely boast such fine, united playing. And this results from the nature of circumstances. Our musicians here form a family; they see each other and practise together daily; they are always the same, so they are able to play a Beethoven symphony without notes. Add to these a concert-master who can conduct such scores from memory, a director who knows them by, and reveres them at, heart, and the crown is complete.

RUIN OF VISINGSBORG (SWEDEN) FROM KUNGSGÅRDEN

A wretched attachment is formed, or strengthened, by which I am linked through my lower self to close and unhappy relationship with the lower self of that person whose faults disturb me.

Now, somehow I must be brought to know that this disturbance is caused chiefly by a serious defect in my own moral character. I must see this faulty person blossoming into something like faultlessness under an influence less harsh than mine, and I must be made to understand that the wise correction of injustice and wickedness is through most gentle, most merciful measures.

Somehow, if the world is to be redeemed, this low attachment, this incompatibility, tyranny, hatred, revengefulness, must be transformed into a bond of pure stuff. But how?

Easily, say the Theosophic teachings, once the desire for purification has grown in the heart. Because of a lack of understanding

Were no man to hurt his brother, Karma-Nemesis would have neither cause to work for, nor weapons to act through.—*Helena Petrovna Blavatsky*

Is Theosophy Another Sect?

THERE is printed on all the literature of this Society the word "unsectarian," but sects are so much the order of the day, and the public mind has become so adjusted to them, that it is almost impossible to eradicate the notion that this is but another of those bodies that are flooding the land, and known as sects. How shall it be distinguished? What shall be the tests applied to it which shall separate it without question from all of these?

In the first place, the whole of the system of philosophy which this movement presents, is founded upon a few fundamental propositions, which any sane mind admits, just as geometry is based upon its axioms. Where it is studied in connexion with any of the world's great religions, it is seen to antagonize none of them, but to illuminate them all. Any one who will take the trouble to investigate, will discover that this Society lays no stress on the subject of any one's belief, exacting only of its members a belief in Universal Brotherhood, and a willingness to work for it; and yet that it possesses the most remarkable power of cohesiveness—that it is, in fact, a real living organization, having a head, and a heart, and a body.

Even these few facts are sufficient to differentiate it from any sect existing or to come. For either they all insist upon some set formula of belief, or, when they react from this, they become diffuse, having no nucleus or center.

The former variety have certainly carried their creeds to the limit of human vagary, in having evolved finally a sect which rallies round the ennobling idea of plunging its victims, in waterproof coats, into a tank of water, in order to prove their baptism of the Spirit. If this story is ever told to future generations, they will no doubt look back in amused pity at their benighted ancestors, and

THE KINGS

A MAN said unto his angel:
My spirits are fallen thro',
And I cannot carry this battle.
Oh, brother! what shall I do?

The terrible kings are on me,
With spears that are deadly bright;
Against me so from the cradle
Do fate and my fathers fight.

Then said to the man his angel:
Thou wavering, foolish soul,
Back to the ranks! What matter,
To win or to lose the whole.

As judged by the little judges
Who hearken not well, nor see;
Not thus, by the outer issue,
The wise shall interpret thee.

Thy will is the very, the only,
The solemn event of things;
The weakest of hearts defying
Is stronger than all these kings.

Tho' out of the past they gather,
Mind's Doubt and Bodily Pain,
And pallid Thirst of the Spirit,
That is kin to the other twain.

And Grief, in a cloud of banners,
And ringleted Vain Desires,
And Vice with the spoils upon him
Of these and thy beaten sires.

While kings of eternal evil
Yet darken the hills about—
Thy part is, with broken saber,
To rise on the last redoubt;

To fear not sensible failure,
Nor covet the game at all,
But fighting, fighting, fighting,
Die, driven against the wall!

Louise Imogen Guiney (Selected)

certainly feel no pride in the relationship. Yet preposterous and absurd as this seems to any thinking person, it has its use in showing to what point the insistence upon creeds will ultimately lead in the present unevolved state of the race. It is no wonder that many swing

to the other side of the pendulum and believe in nothing.

Another method of settling the question is this: Every spring has its source; Truth can never contradict itself. And every revelation which has ever been made to men, must have come from the same unfathomable well of truth. Study Theosophy as one who is searching for that, and see whether it bears the test.

STUDENT

A Crime Against Childhood

THE teachings of Theosophy are being spread broadcast over the world, and there is no longer necessity for any inquiring mind to remain in ignorance of the great truths concerning the human being and his relation to the universe, or to be limited to the baneful conceptions of a Creator and a sin-steeped humanity that once prevailed. The clouds are lifting, and the divine inner nature is beginning to be encouraged to shed its rays over human life unrestricted by brain-mind theories. But even in the growing sunlight of truth there are many who find it difficult to dispel mental conditions that are the result of the narrow beliefs with which, one might say, they were infected from birth, though they no longer hold them. They have been warped and distorted by the teaching given to their young minds, and for a long time nothing seems to smooth out the unevenness. The religious instruction and training that thus doom a human being to hours during which he finds it difficult to believe in his divinity, or to open his whole being to the light, are a crime against childhood.

It is easy to see what a blighting influence dogmatic teaching has upon the plastic nature of a child. Instead of being encouraged to believe in the divinity within, and its power to overcome the lower nature, he is given the idea of a God in a far-off heaven who has to be perpetually pursued by supplications for mercy. Defiance and fear are fostered in the

childish heart by these conceptions. The earlier such teaching is given the worse it is. What an offense, to present to a being who has not long left a state in which he rested in unity with his divine principles, even the simplest version of a teaching that ignores all that is best and deepest in him, and hopelessly confuses him—hindering any glimpse of that glorious unity from recurring, and enclosing him in a prison of bodily and mental life, the soul forgotten and left to retreat.

The glorious possibilities of early childhood are nullified by dogmatic teachings concerning religion. Instead of central truths which shed their light on all he learns, the child gets from them a tantalizing something that later stirs up doubt of any statement that cannot be squared with them. Confusion, a lack of trust, are the results. A whole, properly co-ordinated body, soul, and spirit, the child can never be, until these narrow ideas are driven from his mind.

Before this can be accomplished he has probably attained adult life. After it is attempted they recur in subtle ways again and again. Distrust of self, disbelief of the possibility of becoming what is strong and noble, and the reactive effect of all these doubts, which encourages yielding to faults and habits in themselves a hindrance—are not these very often the recurrences of fears and doubts bred where the doctrines of eternal punishment and predestination held sway? The mind has learned a habit of fear and cannot outgrow it at once, even when the right teaching has been accepted.

It would be well if orthodox parents realized that the highest possibilities recede from those who are growing to manhood and womanhood warped by untrue conceptions of the human being and ignorance of the essential unity of their higher nature with the source of spiritual energy. Intuitive knowledge, the fruit of past experiences, can not be clearly registered in minds warped by narrow conceptions. "We need the gentle breezes of soul-wisdom to brush away the dust of our illusions"; but these breezes can not enter where doubt or fear stand malicious guard.

It will be a glorious day when no child is cut off from his best heritage—that which he has brought from many lives of experience—but preserves unbroken from birth to death the knowledge of his unity with the

source of all joy. And the removal of that crime against childhood, dogmatic religious teaching, will hasten the coming of such a day.

The supreme effort of Katherine Tingley, in her unique system of education now known in virtually every country of the globe, is directed towards breaking down the barriers that keep the souls of little children—and indeed of all—from their rightful inheritance of knowledge, joy and peace. STUDENT

we may hold as to the act itself, we cannot deny that it implied a full conviction of the immortality of the real Self. The *personal* existence was sacrificed to the *impersonal*.

QUEEN VICTORIA of Spain has succeeded to a remarkable extent, in the short time she has been on the throne, in modifying some customs for which the country has been justly considered behind the age. From the first her desire was to minimize, and finally to abolish, the cruel sport of bull-fighting, and she has lately aroused much sympathy in her efforts by reminding the Spanish that the great Queen Isabella fully intended to abolish the bull-fight and was only prevented from doing so by her death. Isabella declared that the custom was cruel and not even Spanish, but purely Moorish in origin, and totally opposed to true Christianity.

Subsequent efforts have been made to break the power of the bloody pastime, but have never succeeded, probably because the Church, which teaches that animals have no innate rights, has never supported them. Queen Victoria's aim, at present, is to make it unfashionable for ladies to attend, for in the absence of the favors and encouragement of the fair señoras and señoritas a great part of the attraction would be missing.

But the queen has succeeded in doing away with another barbarous custom, i. e., dueling in the army. In bringing about this reform she had to act through King Alfonso—who has, on his own part, already initiated many wise reforms. Following the example of the military, dueling among civilians is rapidly becoming a thing of the past.

MME. ELISABETH LOUISE VIGÉE LE BRUN, AND HER DAUGHTER
MUSÉE DU LOUVRE, PARIS. (PAINTED BY MME. LE BRUN)

Jottings and Doings

(From a Student's Note Book)

AS an instance of perfect self-sacrifice, the following is hard to beat. A young Chinese girl conceived the idea of getting her fellow-countrywomen educated, so she established a school. She got plenty of pupils but not enough money. After making every sort of appeal for funds, and meeting only apathy, she meditated on the best means of arousing interest. The idea that came to her was to commit suicide publicly. So she went to Hankow and did it. The plan succeeded, and money poured in, and the work grew to gigantic proportions. Whatever views

A VERY pretty international compliment has just been paid to the United States. The Dames des Halles, an ancient corporation of the Parisian market-women, cherishes many old privileges, one of which is that of greeting and congratulating future queens of France. Though monarchy has been abolished in that country, the market-women decided to revive their old tradition last year upon the engagement of the daughter of the President of the Republic; and this March the "Dames" took advantage of the approaching marriage of Miss Muriel White, the daughter of the American ambassador, to extend to her the time-honored greeting.

OUR YOUNG FOLK

Early Trans-atlantic Boats and the Compass

WHEN we read in today's newspaper about the giant trans-atlantic steamers with their wonderful completeness in every department: comfort, safety, speed, and even the luxury of daily papers, it is interesting to go back in thought to the early navigators and the means at their disposal. What a contrast between the *Lusitania* and the frail *Santa Maria*, *Pinta*, and *Niña*, that Columbus commanded. The bravery of the man—the sheer unwavering trust in himself and his purpose—stands out in bold relief when we think of those little vessels steering into the unknown West.

And yet, if historical records are true, there was a greater daring shown by the Vikings of the Northern Lands five or six hundred years earlier, for it was in the eleventh century that the Vikings brought home reports of the "Vinland" they had found beyond Iceland. Iceland itself had been colonized in the ninth century by them and was well known to their navigators, and "Vinland" was probably some part of the New England coast.

In 1880, at Gokstart, South Norway, the remains of a large Viking ship built of hardwood was dug up. The evidences place its age at between 900 and 1000 years, and there is no doubt it is a type of the boats used by these discoverers of America.

Imagine beginning a voyage from New York to Liverpool, in the most favorable weather, in this frail boat, only seventy-eight feet long and with the merest rude shelter of beams against storms and dashing waves. If it seems a hazardous undertaking we must also add that there will be no compass on board, and guidance will have to be done by the sun by day and the stars at night. The compass was not known in Europe until the thirteenth century, and this point alone makes the Viking explorations the more remarkable.

The compass was known to the Chinese many centuries before its introduction into Europe, though their instruments were constructed in quite a different way from ours. The poetical touch of the Eastern thought had place. In their compasses a magnet was embedded in the outstretched arm of a carved wooden figure mounted on a pivot, and pointed continually to the south. This figure was a magical one to the sailors of those days, and indeed, if we were more honest, would be to us, for science has no explanation of magnetism. The mere fact that we do not yet know how to insulate magnetism as we can electricity, shows our present ignorance. F. W.

The King of Instruments

THE violin is called the "king of instruments." It is the most perfect of all musical instruments made by man, and can more nearly imitate the beautiful, sympathetic qualities of the human voice than any other sound-producing implement.

Lomaland Photo. and Engraving Dept.

A VIKING SHIP

"HOW CHEERY ARE THE MARINERS!"

HOW cheery are the mariners,—
Those lovers of the sea!
Their hearts are like its yeasty waves,
As bounding and as free.
They whistle when the storm-bird wheels
In circles round the mast;
And sing when deep in foam the ship
Ploughs onward to the blast.

What care the mariners for gales!
There's music in their roar,
When wide the berth along the lee,
And leagues of room before.
Let billows toss to mountain-heights,
Or sink to chasms low,
The vessel stout will ride it out,
Nor reel beneath the blow.

With streamers down and canvas furl'd,
The gallant hull will float
Securely, as on island lake
A silken-tassell'd boat:
And sound asleep some mariners,
And some with watchful eyes,
Will fearless be of dangers dark
That roll along the skies.

Park Benjamin

There are no authentic records of the early history of the violin, though it is known that stringed instruments played with a bow are of antique origin. Some members of this family used many centuries ago are still in existence. They are very crudely made, being clumsy

A CHINESE COMPASS HOLDER

to handle, limited in technical resources, and not particularly beautiful in form. Gradually many changes took place in the construction of these instruments, until about three hundred years ago the violin reached its present state of comparative perfection.

The most beautiful violins ever produced came from Italy, where so many arts and sciences have been nurtured. In Cremona lived and worked Amati, Guarnerius, and Stradivarius, the most famous violin makers the world has ever known. Gaspero di Salo, Maggini, Bergonzi, and others were also distinguished violin makers of Italy. It is

interesting to note that Stradivarius, the greatest of them all, worked at perfecting his noble instruments for eighty years, and the violin he made at the age of ninety-three, the year of his death, was one of his best. Although some splendid instruments are made at the present time, yet the secrets of violin-making which the old Italian masters possessed, have so far remained undiscovered. Their instruments possess a tone of wondrous sweetness and purity as well as great power and brilliancy. Some of them are in use at the present time by the world's greatest violinists.

To make a perfect violin requires skill and knowledge of a very high order; for its every curve, while expressing grace and beauty, originates in some sound-producing principle. Every detail of its construction affects the tone. It is a curious fact that many of the possibilities of the violin could not be expressed until nearly a century after it was perfected; for it was not until then that Tourte, a Frenchman, made the necessary improvements in the violin bow, without which the modern feats of violin playing would not have been possible.

Two other instruments constructed on the same model as the violin are the viola or tenor violin, and the violincello or bass violin, the only difference being in size and register.

The "fiddle," as the violin is often called, is the most difficult of all instruments to play. To master it, many years of patient hard work are required; but the wonderful results which can be accomplished are an ample reward. With no other instrument can such crisp, ringing *staccato*, or liquid, melting *legato* be produced. It is capable of myriads of exquisite effects. Although the voice, nature's instrument, is even more ideal and appealing in tone quality, yet it can sustain only one note at a time while the violin can play two-part melodies, and chords of three and even four notes.

Violin music usually requires a piano or orchestral accompaniment; but a few compositions have been written for the violin alone, the greatest of these being the *Chaconne* by Bach, which is one of the grandest masterpieces in musical literature and shows how much the violin is capable of expressing without support.

EVENTS expand with character.—Emerson

THE CHILDREN'S HOUR

The Silent Land

THE children playing on the shore with wind and wave would occasionally pause in their merry games to gaze out towards an island on the horizon, near the setting sun. This island was for them a never failing source of interest and wonder, and their imagination peopled it with heroes and fairies and magic caves, and flowers never seen before. One evening, sitting on the rocks with their teacher, they besought her to tell them the name of the island and all about it.

"The name of that country is the Silent Land," responded May, "and it is, as you rightly suppose, a fairyland, full of wonders and magic. The soil of the Silent Land is where all the flowers grow, and there lie hidden mines of treasure more precious than gold and diamonds. It is in the pure air of that realm that heroism, inspiration, and every high ideal has its birth, and thither wend their way the poet, the mystic, and the hero. The Silent Land is the home of a child's deep love. You have heard of the Holy Land? Know then, that the Silent Land is the real Holy Land; for here it is where soul meets soul. The Silent Land is, too, a battlefield, and there stretch plains where mighty victories are hourly fought and won. The gods are the rulers of this fair land—the mother country of the strong. Listen children, and you may hear borne on the breeze echoes of a song whispering to the heart for the coming fulfilment of humanity's divine destiny."

"Oh, May! When may we go there?" cried the children in one voice.

"You may embark now if you will," replied May, smiling. "See the boats drawn up on the beach! Can you read the name on the prow?—'Rāja Yoga'!" M. V H.

The Greek Story of the Springtime

LONG, long ago, there lived in the beautiful island of Sicily a goddess named Ceres, who had the power to make the earth yield plentiful crops of grain, or to leave it barren, so that all the people of the earth really depended upon her for food. Ceres had one fair young daughter, who was so fresh and lovely and gentle that she was called "Spring."

One day Ceres was obliged to go on a long journey. Before starting, fearing some harm might befall her daughter, Proserpine, she asked her not to wander very far from home. Proserpine promised; but after her mother was gone she went out to pick some flowers and soon was joined by some of her friends. Before very long they had wandered quite a distance in the beautiful meadow to the banks of a river.

Now it happened that King Pluto, who reigned over the underworld, came up to earth that day and was driving along in his swift chariot, when the sounds of musical voices and laughter reached his ears, and, parting some

"HURRAH FOR RAJA YOGA"

APRIL IS HERE

APRIL is here!

There's a song in the maple, thrilling and new;
There's a flash of wings of the heaven's own hue;
There's a veil of green on the nearer hills;
There's a burst of rapture in woodland rills;
There are stars in the meadow dropped here and there;

There's a breath of arbutus in the air;
There's a dash of rain, as if flung in jest;
There's an arch of color spanning the west;

April is here!

Emma C. Dowd in *St. Nicholas*

bushes, he beheld beautiful Proserpine standing in the center of a ring of merry young girls who were pelting her with flowers.

"Ah!" cried King Pluto, "Such a fair face will make even dark Hades light and beautiful." Before Proserpine had time to think he had grasped her by the arm and carried her to his chariot, while the other girls fled in fear of his dark, stern face.

King Pluto knew that he would have to hasten away before Ceres should discover her loss. The nymph of the river, who loved Proserpine, seeing her peril, caused the water to rage and swell so that Pluto dared not attempt to cross. With his scepter he struck the ground three times; it opened, and in an instant, horses, chariot and all plunged into the darkness below; but not before Proserpine had time to seize her girdle and throw it far out into the river. She hoped that in some way it might reach her mother, so as to give her some clue as to how to find her.

Arriving in his underground mansions, King

Pluto did everything in his power to make Proserpine happy; but she only wept and for a long time refused to eat a morsel although King Pluto tempted her with the most delicious fruits and dainties.

In the meantime Ceres returned home and missed her daughter. She searched for her in all the rooms, but no Proserpine. Her grief was terrible. Lighting a great torch from the fires of a volcano, Ceres began a long, long wandering over land and sea in search of her. All her duties were neglected, everywhere the crops failed and the ground grew dry and barren. The starving people came and begged Ceres to resume her duties and be their friend again; but Ceres only answered that until her child was found she could think of nothing else.

At last the people cried aloud to Jupiter, the king of all the gods, that unless he would bring Proserpine back to her mother, they would surely perish.

Jupiter pitied the sad condition of the people, so he advised Ceres to go to the river-nymph. Ceres did, and no sooner did she near the banks than a little swell of the water threw Proserpine's girdle at her feet.

In tears, Ceres clasped the girdle to her heart and inquired of the nymph how it had gotten into the river. "She threw it in," answered the nymph from out of a fountain. "O Ceres, great mother, King Pluto took your daughter, who is weeping, and weeping in his great palace, and refuses to be comforted."

Ceres hastened to Jupiter and begged him to restore her daughter. Jupiter gave her his permission to go down into the underworld, telling her that Proserpine might return to her home providing she had not tasted food while in Pluto's kingdom. But alas! on the very day that Ceres hastened to Pluto's realm, Proserpine had eaten six pomegranate seeds; and for every seed she was doomed to spend a month each year underground.

So when the flowers begin to blossom and the trees to bud, and birds to sing we may know that Proserpine has returned to Ceres; and while she is with us all the earth seems fair and beautiful. J.

The Cows as Kindly Protectors

ON an English estate, a doe was brought up from a little faun, with a herd of cows; with them she went to pasture, and returned with them to the yard. Sometimes she would wander some distance from the herd as fences could not confine her. The dogs of the house were used to the deer and took no notice of her; but when strange dogs came by, a chase usually ensued. Over fences and gates the doe would lead her pursuers until she reached the cows, who, with fierce lowing, and menacing horns, would drive the dogs out of the pasture. The doe knew her friends. Did Jesus Teach Hell?

The Teaching of Jesus about the Future, According to the Synoptic Gospels, is the title of a book by Professor H. B. Sharman, instructor in New Testament history and literature at the University of Chicago; and the press supplies us with an official synopsis of the principal chapters, here printed in full, with comments. Many of the opinions expressed by the Professor are so evidently true and reasonable as to carry conviction with them; and it is important that all Christians who value the truth should face such facts in the proper spirit of honesty and courage, and not allow themselves to be scared into attempted denial on the one hand or into the extreme of scepticism about religion on the other. If one values the Bible, he had better avoid prejudicing his case by insisting on absurd claims with regard to it; consoling himself with the reflection that those who go to the other extreme and refuse it *all* value as a sacred book, are equally absurd. The cause of true religion cannot suffer from a candid examination of the truth; the sifting out of errors can but redound to its credit. The synopsis is as follows:

Dogmatism Provokes Scepticism

Matthew and *Luke* were not produced by eye witnesses but by men who utilized written material already in existence. Within each of the gospels older documents have been incorporated. These documents vary much in form and contents.

It is found on examination that these documents differ from one another in their representation of the course of events and in their report of the sayings of Jesus.

Now why should anyone be discouraged by such a fact? Perhaps because they would have preferred to have their sacred teachings all carefully prepared and predigested so as to save them all trouble in exercising their minds. One of our weaknesses is that we like to have things cut-and-dried; it saves so much trouble. But we can not have things so; the Truth will not fit itself into our categories. Besides, Man has been endowed with faculties intended to be used, and one of these is judgment. The practical value, at least, to be derived from these narratives, does not depend on a precise knowledge of the details of the events set out.

Religion does not Displace Discrimination

Comparison shows that in many cases the reports have been affected by the thoughts of the age in which they were produced. This has resulted in the misrepresentation of what Jesus said.

The sayings of Jesus about the future have naturally suffered by these processes, perhaps more than his sayings on any other subject.

In addition to using old documents, indeed, because

they were dependent upon these documents, *Matthew* and *Luke* supply material editorially, especially *Matthew*, and this editorial material is of a marked character and open to grave suspicion.

Much of the editorial material has to do with sayings about the future. This results in Jesus being credited with views about the future which are in reality the views of the men who, as editors of the gospels, combined older documents about Jesus.

One can scarcely expect but that this should happen. And if anyone asks, What are we to do about it, and how shall we know which of Jesus' sayings are true and which not? the answer is the same as before: we have to use

our judgment to distinguish truth from error, in this as in every other affair of our life. We are in a world of stern facts; we have to run

the risk of mistaking our friends and enemies, of failing in business, of injuring our health by mistakes in judgment, and of all sorts of errors. Things are not made easy for us by special providences. Nor does religion and spiritual knowledge make any less demand on our judgment and energy, however much we may wish that it were otherwise. We are not to be coddled. A truth will find its echo in the understanding, if the heart is pure; and an error will proclaim itself by the same touchstone. There are enough obviously true sayings of Jesus to set us on the path leading to clear discernment, if we will but follow it. Those teachings in the "Sermon on the Mount" carry conviction and their practical value is evident; moreover they receive confirmation in the recorded utterances of other World-Saviors. The teaching that if we live a life of genuine purity and self-sacrifice, inwardly as well as outwardly,

we shall attain a state of enlightenment spoken of as the "Kingdom of God," the "Kingdom of Heaven," "My Peace," etc., is a truth that does not require authoritative support. The obscurer sayings attributed to Jesus may well be left until we are more enlightened; we have more than enough to begin upon.

Theosophical writers often quote the words of Jesus as arguments in support of Theosophy. But, in doing so, they do not commit themselves to any statement as to the authenticity of the words or the actual existence of Jesus. They merely aim at convicting people out of the mouth of their own Teacher, saying, If you believe in your Bible, hear what it says.

It seems clear that the sayings that portray hell and future torments are not from Jesus. Where heaven is treated in the gospels as a place, the saying has undergone modification or expansion.

Practically all the passages in the synoptic gospels

that sketch the day of judgment, and they are many and lengthy, can be shown by comparative study to be non-genuine utterances. Jesus as judge and the twelve as judges are ideas found only in suspicious passages.

**Jesus did not
teach Hell**

The actual teaching of the Wisdom-Religion, as given by all great Teachers, is that those who yield to their desires and passions and fail to subdue them will be by them consumed—not everlastingly, but so long as they remain enslaved to these passions; but that those who master their lower nature will thereby attain that state of peace and perfection which is called “the Kingdom of God.” These teachings are always converted, in times of relapse, into doctrines of eternal reward and eternal punishment, whereby people are controlled through fear and selfish hopes. Mixed up with the doctrine of hell is the familiar teaching that, after the decease of the body, the lower psychic elements of the man pass to *Kāma Loka*, the abode of shades, where they are disintegrated by Nature’s purifying processes; this is compared by Jesus with Gehenna, the place outside Jerusalem where the city refuse was burnt.

False Doctrines

Some of the false theological doctrines are based on mistranslations which have been corrected in later editions of the Bible. Thus a passage in *Matthew* xxiv reads in the Authorized Version:

What shall be the sign of thy coming and of the end of the world?

and in the Revised Version (England, 1881) an alternative rendering—

What shall be the sign of thy presence and of the consummation of the age?

The latter reading was decided upon as being a correct rendering of the Greek original; and it is clear that the earlier translators read their own theological views into their rendering. Jesus merely speaks of the coming of the Christos—that is, of the awakening in Man of a realization of his own Divinity.

And in *Matthew* xxv. 46, “These shall go away into everlasting punishment,” has been corrected to “eternal punishment,” the Greek word being *αἰώνιος*, *aionios*, which means “lasting for an age.”

In the last chapter of *Mark* there are ten verses upon which much of the church doctrine of hell is founded. In this passage occurs the following:

**Doctoring
to Support
Fear**

And he said unto them, Go ye into all the world and preach the Gospel to every creature. He that believeth and is baptized shall be saved; but he that believeth not shall be damned.

In the margin of the Revised Version it says: “The two oldest Greek manuscripts, and some other authorities, omit from verse 9 to the end. Some other authorities, have a different ending to the Gospel.” Was ever a clearer instance of a clumsy doctoring of the text in the interests of dogmatism?

Jesus is credited with explanations of the meaning of his parables. For the most part these, even when they are detailed expositions are not, it seems, the product of Jesus, but of his early followers, who generally misunderstood his meaning.

Jesus is frequently credited with promising that he would return to the earth in glory and power. These are ideas fastened upon him by his disciples, for which he is not responsible.

Jesus is said to have asserted that the end of the world would come before the generation to whom he spoke had passed away. Elsewhere in the same gospels it is reported that he predicted that the gospel would have to be preached in the whole world before the end would come. Neither of these contradictory assertions is from him; they are both editorial products, one written by the man

**Contradictory
Predictions
Attributed
to Jesus**

who put *Matthew* together from certain written sources, the other inserted by some later hand at work upon *Matthew*.

The attention of orthodox people is called to the fact that if they accept these passages literally and entirely, they must convict Jesus of being wrong about the end of the world and the second advent. These ideas were clearly the enthusiastic fancies of some of his followers, who misunderstood or misinterpreted his allegorical sayings about the changes of cycles and the coming of the Christ in the awakened man.

References in the gospels to “the church” are few, and these few are in passages not found in the original documents, but rather in editorial passages which seem to have been added to support current views and practices of the church.

Jesus was opposed to ecclesiastical organizations and was not sparing in his words when he denounced them. But, when he was gone, such organizations were made, and apparently by the very people who had denied him while he

**Distortions by
a Selfish
Church**

yet lived. It is among the noble aims of Theosophy to vindicate the Master against these misrepresentations of his sacred teachings, thus fastened on the world by people who were afraid to acknowledge him during his life. In doing this, Theosophy is rendering a service to Christians. Those Christians who prefer to remain under the spiritual domination of the churches may not like it, but those who value the gospel of liberation as taught by the Master will welcome it.

The synoptic gospels give no support to the belief that Jesus instituted the Lord’s supper or the rite of baptism. Apparent support occurs only in passages that were added later to the records of the more original documents.

The rite of the “Lord’s Supper” is a very ancient one, being one of the ceremonies of the Mysteries. There were several schools and cults of the Mysteries at the time of the Christian era; and the early church people adapted this rite to their newly formulated creed. The Rev. Robert Taylor says:

**The Eucharist
Pre-Christian**

The Eleusinian Mysteries, or Sacrament of the Lord’s Supper, was the most august of all the Pagan ceremonies, celebrated more especially by the Athenians every fifth year in honor of Ceres, the goddess of corn, who, in allegorical language, had given us her flesh to eat; as Bacchus, the god of wine, in like sense, had given us his blood to drink. . . . From these ceremonies is derived the very name attached to our Christian sacrament of the Lord’s Supper, . . . and not one or two, but absolutely all and every one of the observances used in our Christian solemnity.—(*Dicæsis*)

Whether Jesus merely celebrated this ancient rite and took occasion to base some teachings on it, or whether the whole story of his last supper is spurious, in either case he did not invent it.

All the evidence seems to place grave doubt upon

the report that Jesus gave an explicit commission to his disciples to go into all the world and preach the gospel.

**Three Strata of
Material in the
Gospels**

These passages in which Jesus is reputed to have asserted that he would be present with his disciples after he had left the earth are apparently not from Jesus, but are the expression of the experiences of his disciples, and these experiences may be otherwise explained than due to Jesus.

In the synoptic gospels there are several strata of material: 1. What Jesus probably said. 2. What the earliest editors of the gospels thought he said or would like to represent him as saying. 3. What later editors thought it best to represent him as saying.

Thus, while we have people who adhere to the literal interpretation of the Bible, and people who reject the entire thing as fable, we have now others, and prominent clergymen too, who recognize that it is a mutilated and transformed sacred teaching, and who realize that we can neither reject nor accept it wholesale. But whither do the bold admissions of these clergy lead them? There is no alternative for them, if they are to be consistent, but to accept the position of Theosophy and admit that the essential teachings of all religions are universal and eternal, every Teacher and Savior preaching the same truths, and doctrinal additions being always added in after times by ecclesiastics and bigots. This brave clergyman has knocked away so much, including the church itself, that he has left nothing on which to base the claim of Christianity to be an exclusive or consummating revelation. STUDENT

Shackleton’s Antarctic Expedition

LEUT. Shackleton reached latitude 88° 23', 111 miles from the South Pole, outdoing Scott’s expedition towards the same pole and Peary’s towards the North Pole. He sailed from England in July 1907, equipped with the experience he had gained with Scott’s expedition of 1902. The winter was exceptionally mild, though the thermometer fell at one time to 88° F. below zero. He took with him fifteen Manchurian ponies, twelve Esquimaux dogs, and a motor sledge, in the hope of covering the 463 miles between Scott’s furthest south and the pole. The use of the ponies to replace some of the dogs economized the food, but the sledge could not cope with the huge inequalities of the ice, though it proved useful in establishing food depots.

A few sea-mammals were found within the Antarctic Circle; along the Great Ice Barrier a few birds were seen. Penguins and gulls frequented the winter quarters at Mount Erebus; but in the interior no life was found except a few lichens and mosses and a wingless fly.

The distance covered was 1708 miles. He passed the very point reached by Scott in 1903, pushed on for 325 miles, and was eventually compelled to return by hunger, fatigue, scurvy and the loss of dogs and ponies. He discovered eight new and distinct mountain ranges and over a hundred mountains. Mount Erebus, 13,120 feet above sea-level, ejecting steam and sulphurous gas in the midst of the ice and snow, was ascended. The south magnetic pole was reached in lat. 72° 25'. The blinding storms which were frequently encountered gave no promise of the fulfilment of the belief that there lies around the pole a region of calm. Nor was any evidence obtained that the waters of the ocean rush in a mighty whirlpool into the bowels of the earth. T.

Some Views on XXth Century Problems

A Dream Without a Dreamer

IN ordinary waking life, the man, the self, is mainly functioning through brain and body, taking in material through the senses and acting upon it, and storing the whole in memory.

Physiology regards these stores as somehow accumulated in the brain cells. Theosophy says they are connected or connectable with the brain cells, but are actually stored in a subtler (though still material) part of the total make-up. This storage-body, which is on the plane of ether, constitutes with all its memory contents the post-mortem spook. The soul has then departed, carrying with it to its own place such of the total mass of memories as it chooses to retain, such as concern its now freed and finer life. To the hardly conscious spook remain the *husks* of memory, rapidly to fade with the spook's disintegration. If at séances it is attracted by thought into the field of the light of living consciousnesses, it begins to absorb some of this light; its memories, layer by layer, begin to stir and may be got in a decreasingly fragmentary form (though never fully coherently) through the hand or voice of the medium. Steadily re-galvanized or relit by séance after séance quickly repeated, absorbing from living minds at each, and displaying layer after layer of its palimpsest, it may however come at last to a very fair resemblance to a really living intelligence.

Some of the recent English sittings, investigations of what purports to be the late Professor Myers, so exactly indicate this induced awakening of a spook, that one can only wonder at the failure to detect the secret, still more at the ascription of the actual being of the Professor to this palimpsest which the investigators are at the same moment exposing the dim layers of, and themselves writing on.

"Myers" was asked, through the medium Mrs. Piper, to give the author of three Greek words meaning "the very heavens without a wave." They are from Plotinus, were used in Greek by Professor Myers as the motto of his poem on Tennyson, and in English in his book *Human Personality*, occurring in the course of his treatment of Ecstasy or gnostic illumination. He was therefore very familiar with them and might have been expected to reply at once.

The question was submitted to "him" at a séance of January 29, 1907. Professor Graham, who reports the attempt in the current *Hibbert Journal*, himself says with amazing suspicionlessness of the significance of his own remark:

Let it be remembered that we have to do in this investigation with the operation of a mind which appears to dream, and to bring out of its treasures unexpected allusions, glimmering attempts at a central idea. . . . We shall not, therefore, be surprised that the first answers to the test question were glimmering approaches to it only.

The day the question was propounded, "Myers" replied by a few disconnected words that seemed to have some connexion with a verse from *In Memoriam*.

On February 12 the sitters were rewarded

with several long confused sentences consisting of disconnected echoes from Tennyson, and one from Keats, with complaints that "the idea" was "hard to convey." This is the first sentence, which we give by way of example, obviously mere meaningless echo:

The voyage of Maeldune fairy lands forlorn and noises of the western sea—thundering noises of the western sea.

On February 25 there were more rapid echoes, mainly from Tennyson's *Lucretius*. The next day more, now getting a shade nearer Plotinus. On the sixth of March, more; but now he gets near enough to Plotinus to use the words "the heavenly and earthly calm." By March 11 he has gotten as near as Plato. On April 29 there were allusions to no less united a family party than Swedenborg, Dante, St. Paul, and Francis of Assisi! At the next sitting Myers told the circle that the words reminded him of Homer's "Illiard" (*sic*). Then came the word "Socrate" (*sic*).

At last, on May 6, after three months, came "Plotinus." Are we not justified in asking whether this thing has not succeeded in disproving its identity with the soul whose personality was Professor Myers? But there is some glamor about such investigations, and we shall not be surprised to find that the deliverances concerning the metaphysical world—when they come—of a "professor" that takes three months to remember how *not* to spell Iliad and does not know when it has completed an intelligible sentence, are accepted as a new gospel.

STUDENT

The Man and the Shell

SUPPOSE a man, an intimate acquaintance of our own, a close observer, a man of science, a professor, a thinker and writer, were to visit some far country.

After a considerable absence we get a letter in his handwriting, signed with his name and of some length. The writing seems however very shaky and the ink very pale. Moreover whole lines are entirely blank, faint scratches only, as if he had forgotten to dip his pen and had not noticed the omission.

And instead of containing any fragment of information the letter opens with a dissertation on the difficulty he feels in writing at all; pages profusely describe how stiff his hand is; other pages describe how indescribable are the scenery and general conditions of the country, not a detail being given; still other pages tell us how dense are our minds, so dense that he despairs of ever making us comprehend the description he has not given. Notwithstanding his former intelligent interest in everything at home, he now asks not a single question as to how matters have gone on in his absence.

We write asking for a few details, even one salient fact, about the country. His reply is again very lengthy but of exactly the same sort, explanations of his difficulties. And in lieu of facts he appends some verses of fatuous and irrelevant poetry—of his own mak-

ing, he proudly says, though we never knew him to aspire in that direction before—and a sheetful of platitudinous moral exhortations.

What should we think?

STUDENT

The Roots of Ancestor-Worship

A CONTEMPORARY, in a long article on ancestor-worship, very remarkable in its concessions, contends that all the ritual of those cults surviving today, point to or date from a purer and higher past. Civilization after civilization arises; at its highest level each develops a correspondent religion; as time goes on, each begins to decay; with its decay its religion begins to grow corrupt and the roots of symbolic ritual to be forgotten. The writer holds, with Sir William Ramsay, that if we could look back along the crests of the successive religions at their best, we should find slow degeneration from some very high form.

Religion was once an affair of inner consciousness, however deluded in its deliverances; ritual was designed for the people, not to be, but to express, these inner deliverances and workings. Then it came to stand for itself and became corrupt and superstitious.

What then is real ancestor-worship, from this point of view?

The people thought themselves still in some deep spiritual unity with their dead. They cultured this feeling, made of their hearts altars where it might become a flame whose incense-smoke might ascend. Heart could still speak to heart in feeling though lips must be silent. The repose of the dead was to be helped, not hindered.

And so a symbolism of altar fires was employed. The love of the living was also the food of the dead and then the symbolism was the cakes and fruits.

The writer tries to work out more of this, showing how the symbolism sank lower and lower till at last the dead were even thought to be hungry and in need of meats and drink. And so on. We, in the West, invite them to rap tables, and regard their divine rest as perfectly compatible with general conversation and the delivery of "trance orations."

But suppose that consciousness were *not* "deluded in its deliverances." Suppose that the interplay of heart, of feeling, between mother and son, between all who really love in the sacred way, deeper than mind, deeper than any concrete thoughts, is *not* broken by death; that it persists throughout all the repose time of the dead and is ready again for outer manifestation at rebirth, is even the cause of the birth together of those between whom the current runs. Might it not stand, for the individual, as the secret but certain evidence of the livingness of those we call dead? According to Theosophy, the current does run, both ways, and is a sustaining and helping spiritual force on both sides.

If the writer had read the ninth chapter of H. P. Blavatsky's *Key to Theosophy* he would have learned more of the roots of Ancestor-Worship and of the last degradation of that cult in modern spook-worship.

Ancient "Negroid" Civilization in Nubia

REALLY, it seems scarcely worth while to theorize about the older history of mankind on the basis of the present outfit of data, so frequently are these data added to by new and totally unexpected discoveries.

Now a negroid civilization of a high order has been found to have existed in Nubia during the first five centuries A. D. This discovery was mentioned in the *CENTURY PATH*, vol. xi, no. 41, but more particulars are now forthcoming. (Article in *Records of the Past*, abstracted from *Old Penn.*)

An explorer has recently returned to America with a rich collection of archaeological treasures from this region. Everything shows the inhabitants to have been negroid in type and to have had a "most advanced and original state of civilization."

Most of the pottery is well formed and beautifully designed, some of it showing Egyptian, Greek, or Roman influence, but all adapted to the racial genius. There are about 120 inscribed tablets in the "Meroitic" tongue, as yet undeciphered. The objects found prove that the natives had intercourse with the great nations of the world. A magnificent collection of Roman glass, and some beautiful Hellenistic bronze pieces, including bowls, basins, spoons, ewers, a lamp, a punch ladle and

a dish, were among these objects. Among the collection are about 150 small earthen cups, 20 statuettes, and 40 heads cut out of sandstone, 280 sets of glass beads, nearly 100 engraved finger rings, 4 complete wood and ivory boxes, and numerous other pieces of wood — plain, lathe-turned, and inlaid, anklets, necklets, bracelets, ear-studs, sandals, quivers, shears, etc., etc. The glass beads, conjectured to be native, show an inlay of glass in glass, which inlay must have been fused.

All this shows the people to have been excellent workmen, with good tools, and wearing artistic apparel. And these finds, it appears, are only what was left by ancient tomb-robbers who removed all the more valuable things.

It does not do to dogmatize about either the past or the future of races, even if they have been unprogressive for many centuries. Our classifications do not fit the facts, except on a small scale of time. Looking farther back, we find forms shifting and dissolving into one another so that we can no longer point the finger and say this is this, and that is that. Thus humanity may not have been *always* divisible into Caucasian, Negroid, etc. We may also learn, in our calculations for the future, to allow for the possibility that a race may grow in culture, if let alone and not interfered with by extremists of any type. T.

Spartan Art 700 B. C.

WE have been wont, from our histories, to regard Sparta as a handful of rude warriors who only succeeded in holding their own against their neighbors by creating an exceedingly warlike and ascetic mode of life. Previously to this, they were simply a wandering tribe. The Greeks themselves have left us stories of a more ancient renown; but these stories are opined by the learned and clerical gentlemen who write histories to have been invented by the Greeks afterwards in order to give themselves a creditable history. It is perhaps natural that historians who are engaged in works of creative imagination themselves should suspect other people of the same thing; and it is comprehensible that finding themselves unable to appreciate the motives and sentiments assigned by the ancients themselves, they should supply the deficiency by assigning motives out of the stock with which modern life has made them familiar.

But truth is noted for longevity and the hand of time never fails to discriminate the genuine from the false. We read that recent excavations in Sparta have established the fact that Spartan art was in its zenith in the 8th and 7th centuries B.C., and that probably militarism caused its decay. STUDENT

✻ The Trend of Twentieth Century Science ✻

The Life Center

HUMAN anatomy does not seem to have said its last word yet. Only the other day it announced a new gland in the neck, of undiscovered function, perhaps the equivalent of a lymph-heart, perhaps of the animal hibernating gland.

A vital thread has now been found in the heart. The heart is really a seven-chambered organ, though only four of these are separately enumerated in physiology—the two auricles and the two ventricles. But each of the auricles has a little dilatation opening from it called its appendix; and in early life there is a dilatation (or chamber) which subsequently becomes partitioned into the roots of the pulmonary and aortic arteries.

In the heart cycle the two auricles fill with blood from the veins. When full they squeeze this into the two other chambers, the ventricles. The succeeding contraction of these latter forces the blood out into the arteries and so over the body.

It is therefore the auricles that initiate the cycle, transmitting the impulse to the stronger ventricular chambers. A little fiber, buried in the heart tissue, passing between the two sets of chambers and constituting the vehicle of the transmission, has now been found. It is about an inch in length and though serving as a nerve is a specially sensitized thread of muscle.

The heart has its own private nervous mechanism, independently of the other two nervous systems—the cerebro-spinal and sympathetic; and it can therefore continue its beating when connexion with these two is severed. Their duty to it is to keep it in touch with the rest of the bodily activities, to slow or quicken it. In some of the lower animals the ganglia constituting this private nervous system have been discovered buried in the muscle, though not their radiating fibers. In man their existence is assumed from analogy; they have not yet been found. Judging from this "new" filament it seems possible that some of the muscular tissue may be set aside, extra sensitized, for the work; or the heart-brain (which must exist) may reside in that new thread itself. By that thread we hang from universal life. STUDENT

Muscular Hearing

RECENT progress in physiology makes it appear probable that the muscular system has, in addition to contraction, a much finer department of work; that it is, in fact, one of the organs of hearing.

Graber, says *Prometheus*,

has found inside the bodies of insects, attached to the inner side of the shell of chitin, structures which he and other observers regard as organs of hearing. Graber calls them chordotonal organs, because they generally resemble stretched strings.

These were originally muscular fibers, becoming gradually set apart for the finer purpose. The gap between the muscles and the ear is thus bridged.

It is moreover now known that the internal ear, that part buried in the bone, besides its

connexion with hearing and with the maintenance of the erect position, (many cases of giddiness are due to disease of the inner ear), has a third function, connected with the maintenance of muscular tension throughout the body.

A large part of the human body, the mass of voluntary muscles, is made of fibers of a multitude of lengths and all normally in tension, strung on the bony framework. They are resonant enough, in contraction, to yield a note, a very deep one of sixteen vibrations a second. They must also yield it, though very faintly, in their normal condition of slight tension; and it must run up, like every fundamental from a stretched string, into a series of finer and finer overtones. If they yield these, they must also respond to them when reaching them from without by way of the skin. May not this response excite the sense of hearing in a very fine and subtle way?

Fishes have no external ear, only the internal, covered with skin. It has been found that in the absence of this, and even of the auditory nerve, there is often a fair amount of hearing. This is doubtless muscular hearing, transmitted to the brain from the skin by way of the muscles.

Considering all this, does it not seem probable that the state of muscular tension which we instinctively induce when intently listening, may be part of the act of hearing?

And that music coming up persistently into the mind for hours after we have heard it on instruments may be *actually* being re-heard, echoing about on the Aeolian harp of the muscular masses?

And that fine sounds from nature, when nothing is perceptibly appealing to *auricular* hearing, may yet be rippling through the entire body, taking a great though unnoticed part in the mass appeal which night scenery so often makes to the sense of subtle life and beauty? The body may be something better than a digesting apparatus on legs! STUDENT

Blinking the Obvious

A CORRESPONDENT of *Knowledge*, a B. Sc., relating the behavior of a geranium, makes some extraordinarily instructive comments. They ought to instruct himself if he will re-read them.

The geranium lay out flat upon the top of a mossy wall, its roots sunk into the moss, the stalks bearing the leaves radiating out every way from the center. A photograph is given, the plant looking somewhat like a rosette.

He cut through the root level with the moss and carried home the flat rosette of outspread leaves, placing it in a little water in the bottom of a deep sponge dish. Two or three days later he happened to look at it. The outermost ring of stalked leaves were still in the bottom of the dish; but the inner ends of their stalks had raised themselves upon their supporting outer (leaved) ends so as to lift the inner ring of leaves two inches. The plant had as it were humped up its back. The outer leaves had sacrificed themselves as leaves in

order to become feet or elbows so as to lift the young central leaves up into the light!

He asks:

What force was it that impelled the outer leaves to press downwards on the floor of the dish and the inner end of their stalks to hoist themselves with their burden upwards, whilst at the same time the more central leaves were taking a directly opposite course of action?

As if to make his question carry its own answer he goes on:

It is just the course of action two men would adopt who were trying to reach some point unattainable by either alone. One man would hoist the other on his back, and the second man would attain the desired object through the agency and surrender of the first.

The reader naturally expects he will now say: "Of course the plant brought intelligence to bear upon the problem."

Not at all!

As we only admit blind vital forces acting in plant life—as we do not recognize the smallest measure of intelligence in plants' procedure—how can we reconcile the varying action of the leaves?

And

One may not, of course, at our present state of knowledge, credit any plant with *conscious* instinct, or with the *conscious* working out of a plan to meet difficulties even in a case like the present one which would almost seem to challenge our denial of intelligence to plant life.

But perhaps he is satirizing the denials of science.

If the plant had had roots, and the dish had had soil so that the plant lived, we might have said that it had acquired a temporary variation, one so marked that if it were transmitted it would have constituted the mark of a new species. But acquired variations are *not* transmitted, and so the plant's seedlings would have had the usual shape.

Yet faculties grow by use, and this plant had certainly used to the fullest its intelligence in making the adaptation to strange surroundings. May not the *sharpened intelligence* be transmitted? May not the offspring of such a plant be a little readier than otherwise to meet emergencies of change in their surroundings, a little readier to make permanent variations, to become the *mutants* of Professor de Vries? Advance in intelligence would thus be the secret side of evolution, perhaps showing itself only quite remotely as actual visible change of type or additional complexity of structure. STUDENT

Plants on the Planets

AT a recent meeting of the British Royal Photographic Society, Mr. Butler showed photographs of the spectra of Jupiter, Saturn, Uranus, and Neptune, sent to England by Professor Lowell. He pointed out the extraordinary fact that there were bands in these spectra corresponding with the absorption bands of Chlorophyll, the green coloring matter of plants!

If that is established, it would seem that these planets must be covered with vegetation like our own. But. . . Well, we are waiting to be shown the spectral bands of haemoglobin, neurin, protoplasm, and even bile! STUDENT

Brotherhood a Fact in Nature

This Organization declares that Brotherhood is a fact. Its principal purpose is to teach Brotherhood, demonstrate that it is a fact in nature and make it a living power in the life of humanity.—Objects of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY.

IT is of the highest importance to show that Brotherhood is a fact in nature, because men take the workings of nature as their pattern. Nineteenth century science, with its externalism and animalism, has regarded too much mere superficial appearances, and ignored the consciousness and intelligence of nature, and so taught us to regard it as a ruthless machine. Hand in hand with this conception has gone the tendency to regard human life as modeled on the same ruthless mechanical plan. Materialism, animalism, selfishness, in human ideals are thus intimately interwoven with the false views of nature.

Twentieth century science bids fair to prove that nature is not a blind mechanism but an assemblage of intelligent powers. Wherever we look, whether it be in the animal kingdom, or among the plants, or even in the sublime architecture of the mineral crystal, we see the same evidences of purpose and plan. The time has gone by to regard all this as the direct work of a single Deity without intelligent agents. We realize now that though there must be an Eternal Unity—an All-Parent—it is manifested in the universe in innumerable Intelligences of every order, from those which we can see to those which we cannot see. Every human being is a Soul; every animal is a soul; every plant is a soul; there is no tiny cell or mineral atom but is the expression and tenement of a soul.

And all these Intelligences work together in harmony, so as to produce an ordered result. Solidarity is their law and constitution. We have had great writers who have tried to show us that among wild beasts there exists a Law of Solidarity recognized and obeyed by all; as time goes on we have more and more of such writers, so that we are getting accustomed to have the intelligent and moral side of nature presented to us in place of only its mechanical details. These writers are sometimes mocked at as romancers, but that is becoming a name to boast of; for we are beginning to see that the so-called rationalistic way of looking at things is neither the only way nor the best way, and that we should use the divine gift of imagination.

It is one of the objects of Theosophy to reveal nature as an assemblage of Intelligences, directed by harmonious laws. This

Lomaland Photo. and Engraving Dept.

GAP OF DUNLOE: SERPENT LAKE, KILLARNEY

object fits in with the Theosophical teachings as to the higher powers of man. For by the use of those powers we may approach nature in another way than that of mere observation by the outer senses.

One of the higher powers of man is *Sympathy*. This means much more than an emotional feeling; it means an actual perception of our inward homogeneity, rapport, continuity, with all beings. Those having sympathy cannot wantonly injure any creature, for they feel that they are thereby inflicting injury upon themselves—injury upon the One Life in which they partake. Those not endowed with sympathy regard other creatures as wholly separate from themselves and scruple not to injure them. And the penalty? For those who regard nature as separate, separate she will remain; but it is they who have closed the doors; wisdom shall not be theirs, but error. And the reward of those who have opened the door of their hearts to the heart-light of nature? For them nature will reveal her cherished secrets; they have won her confidence; wisdom shall be theirs, and error shall melt away.

Treat an animal like a machine and you will get a machine; and might as well sell it and buy an iron one, which is more economical. But treat an animal as an intelligent Soul, working its humble way up through the orders, and you will open out its nature as a green plant buds into flowers when it is watered. Many lovers of animals have found this out; but there is much more to be found out.

Even crops respond to intelligent sympathetic treatment, and probably half the effects of the new notions of growing them are really due to the human touch imparted by the tiller's thoughtful care. Nay more; with a sympathetic reverential touch we may even learn to mold metals and minerals to new uses and rediscover secrets of ancient science; for not even wood and stone are dead materials; they are organized and sensitive, and even science is coming to recognize this. The One Life that beats in our bosom pervades them too. Engineer on your pet engine, mechanic with your favorite tool, writer with a pen that you will not lend—you are no cranks. You have but mastered a little of the magic power of sympathy, by which Orpheus led trees and stones, the power that can evoke a response from "dead matter"—matter that we have tried to kill. And who knows but, when we shall have acquired more of this magic power, we may find ways of getting along without doing so much killing.

A Plant which Flowers Underground

THIS is a pea of the genus *Lathyrus*—*Lathyrus Amphicarpos*. The flowers above ground are pink tinged with blue. The underground parts bear flowers and pods, perfect and similar to those above ground, except that every part of the underground plant is whitish. The plant is much smaller than any other pea, rarely over a foot high, and is grown rather for its singularity than its beauty of appearance.

THE VISION AND THE FACULTY DIVINE

WHEN it will, it comes,
Like the rain, or the bow,
Or the nightingale's lay
By the lake below—

As free from restraint as the seraph that roams,
O'er the ebbing waves of the dying day,
When the reddening West, twixt the Sun and the sea
Seems to open the doors of Eternity.

Like the rainbow it comes—
As the sign of the Covenant made long ago
'Twixt Godhood and thought, when, abating its flow,
The sea of Eternity brought into sight
Time's far-distant mountains, and safe on their
height

There rested, by God to humanity brought
The Ark of Eternal, immutable Thought.

Translated from the Welsh of Islwyn. (From The Nationalist)

Karma

IN *The Key to Theosophy* Madame Blavatsky defines Karma as "the ultimate Law of the universe, the source, origin and fount of all other laws which exist throughout nature."

Accepting this, it is plainly seen that we have a subject so comprehensive that one must approach the study of it with patience, and so far as possible, with a mind free from preconceived ideas or prejudices. Our minds are bound by limitations which we, under the law of Karma, have cast about ourselves, and upon the face of things it seems mere impudence that we should strive or expect to know the "Ultimate Law," but may we not intelligently and quietly observe its workings, and through right action and aspiration come into a fuller comprehension of the laws of life and being—Cause and Effect? And may we not by obedience and service in harmony with the workings of it come to understand better this universal law of harmony and justice?

This law is both universal and individual in its application, and in the broad sweep of its action the individual must partake of the national and universal Karma, just as every citizen is, theoretically at least, held responsible under the law of the city, state, and nation.

In its individual application Karma might be called the thread of life, upon which are strung the pearls of experiences—some dark and lusterless, perhaps, but pearls withal.

Through every life this thread may be traced. Some call it fate; some, Providence; others, chance. Theosophy teaches that it is law, and has given it the name Karma, a word for which there is no exact synonym in the English language.

In one case man bows blindly to the unknown; accepts without question the so-called will of God; or indifferently pursues his way in a world of chance. In the other case, by right of his belief in his own divine

origin and potentialities man approaches with reverent, unfaltering step the contemplation of this great, universal law, and without fear questions himself and all nature as to its action.

In all action the motive is the real test of our worthiness, and under the just rule of Karmic law, man receives in answer only that which he is fitted and worthy to receive. Can we deny that such knowledge would add much to the significance and understanding of the constant stream of events and circumstances through which the human soul must pass?

For the full carrying out of any law agents are necessary, and the mighty law of Karma is not an exception. Recognizing as we do the interdependence of humanity and all the visible universe, does it seem unreasonable to believe that these are agents—conscious or unconscious—of the simple, all-comprehending law that "as ye sow, so shall ye reap?" Theosophy teaches of other agents, whom the ancients recognized and honored, but whom the modern mind refuses to regard other than as superstition or childish fancies.

The Leaders of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, and the great teachers of Truth, throughout all the ages have ever taught that it is through selfish action and disregard of this high moral and all-pervading law that humanity has brought into the world the sorrow and crime that we see all about us.

The mission of Theosophy is to bring to the hearts of men this forgotten knowledge, through a re-statement of this immutable, just, and beneficent law of Karma; that with this knowledge men may once more turn toward the light and grasp the present opportunity to work for the uplifting of the race. M. R. F.

Theosophy

AS by the light of the morning sun the stars are all concealed, so by the light of Theosophy shining in the hearts and lives of men, all other interests are outshone and hidden in its greater radiance. Through devious ways the soul pursues her pilgrimage, turns unsatisfied from every alluring offer of habitation until she comes to where Theosophy sheds its pure beams upon her and she knows her feet are at the gates of home. And is not the Divine Law testing and proving all through the journey, until the soul can recognize the false from the true, the partial from the whole?

Then, too, much has been gathered on the way, which now must be cast aside—robes of self-righteousness perhaps, in which the soul has tried to clothe herself, and the flesh-pots of Egypt, in whatever form is most attractive to each one, or some leaning-post which has seemed to be a support. But the gate is narrow and all must be left outside. Naked and alone the soul passes through into the Kingdom of Heaven (which is a state of existence, not a material place of abode), into the realm of infinite love, and tastes the pure joy, the bliss of union with all other souls who have striven onward and won their way into the realities of life. Dwelling still in human bodies and living in a world of mistaken ideas where the real and permanent things of life are hardly known, joyfully do they now take up their daily life, making their minds and bodies obey the will, which William Q. Judge defines as "the soul in action," meet-

ing bravely the difficulties of life, with the consciousness that every effort made and every victory gained is a help to all.

Theosophy is practical and requires the deed to be done if the doctrine would be known. When the scales have fallen somewhat from our eyes we find we are entangled in a web of our own weaving built up of the constant giving way to our lower nature, and the pandering to desire which is fast threatening to envelop us completely. Many little indulgences which looked innocent enough in the beginning we learn only too late how difficult they are to overcome; for sin has two faces and does not show its ugly one until a hold has been gained upon its victim, until it has become hard to break away. But every time a thread is loosened or broken by the now awakened soul, that particular thread is easier for others to break and the inspiration to do right is lit by the Theosophical knowledge of unity, of Universal Solidarity.

One of the great aims of the three Leaders of the Theosophical Movement has been and is to teach the children the truths of Theosophy; to strengthen them while young; to teach them wisdom, so that when they have to meet the results of their past lives in the form of temptation, they will recognize sin even in its fairest garb and conquer ere it strikes them. Unsoiled themselves, they shall go forth and carry to the world Light, Truth, and Liberation. C. N.

Friends in Counsel

HOW often have we not thought, if only we were surrounded by such or such an environment, then we would be free to act rightly and do all the good deeds we have so often dreamed of doing.

Then, after a while, to many of us, there has come a change in our surroundings, perhaps just in accordance with our wish, but soon we find ourselves making the same complaint. Many times, perhaps, changes in our surroundings have come but we do not find ourselves any more contented after the novelty has worn off and we get used to them. Is it not plain that the fault lies somewhere else, in ourselves, and not in our environment; that the wrong is in our own nature, our character and disposition?

Have we ever felt free? Have we ever felt as though it were in our power to accomplish all that we ever hoped for; felt as if we could change the world? Such feelings may perhaps have come to some when for a moment they had, as it were, stepped outside of themselves and entirely risen above the personality with its limitations and its desires for self-gratification. We often complain about our faults and habits which we say stand in our way; but we are afraid to let them go, we are afraid we shall lose something. Oh, if only we could see the truth in Jesus' words: "He that saveth his life shall lose it; but he that loseth his life for my sake, the same shall save it."

If we persist in holding on to the lower, we know we can never gain the higher. It needs the exercise of our spiritual will, and once we let go the lower we do indeed find the true life. Do we not know that this is so?

Through Theosophy has come the message of freedom, the knowledge by which we can rise above environment and no longer be slaves to the lower self. N. R.

From THE PRELUDE

WISDOM and spirit of the universe!
 Thou soul that art the eternity of thought!
 And giv'st to forms and images a breath
 And everlasting motion! not in vain.
 By day or starlight, thus from my first dawn
 Of childhood didst thou intertwine for me
 The passions that build up our human soul;
 Not with the mean and vulgar works of man,—
 But with high objects, with enduring things,
 With life and nature; purifying thus
 The elements of feeling and of thought,
 And sanctifying by such discipline
 Both pain and fear, until we recognise
 A grandeur in the beating of the heart.

William Wordsworth

THEOSOPHICAL FORUM

Conducted by J. H. Fensell

Question How is it possible to kill out remorse and the memory of past failures?

Answer How else than by work; that is to say, work not performed for self? We have to ask ourselves, what it is that so gnaws and troubles within, and remains a bitter taste behind all pleasantness. That we should repent and "flee from the wrath to come" has been dinned into our ears from childhood, and, alas, into our minds also, until we have been caught up by the fallacy and deem the whole business of regret inevitable. But no one was ever made free from anything in that way. One can swing back from evil courses, and agonize mightily over the thing that cannot be undone, and only ensure repetition of the offense; a common pendulum would tell you as much. You have failed once, or a thousand times, through resigning governance to the demon within you; that demon has an interest to advertise perpetually his success.

He will keep you hypnotized that way; convinced of his power, terrorized, and so again and again an easy prey. You have to shake him off and have done with him; to become certain of your own superior strength. To work, then, and let your own steadfast stream of action convince you. The soul, too, is impatient to come into your life and have all the corners of it free from impurity. Our problem is to create an atmosphere for the soul.

The first requisite is that there must be no thought of self. The soul's life is as sweet and universal as the winds and sunshine; it fails to understand this grasping after less than universal ends. Katherine Tingley has said that we should not visit the graves of slain failings; for those graves are always haunted by the malignant demon self. Thus those who set the attainment of heaven as their motive, defeat their own ends; because we have no enemy to conquer but this one of self, which is as much encouraged and vivified by the offer of *post mortem* reward, as by the prospect of any indulgence now. Open the door to that sin of selfhood, and you can put no embargo on what shall be imported. Although without it may pose in ever so fair and religious a garb, it will bring with it a legion of devils; being indeed itself hell and all her principalities.

What could please it better then, than that you should have your gaze turned upon it? since it lives upon your attention, and were you to turn away, it would die. Thought away from self, altruistic thought—that is

the only river for the Augean stables in our minds. And thought that is not carried out to its true end, which is action, is ineffectual and abortive, and there is no place for it finally; so that we have to *do*, and dedicate our actions to the Divine Self of the world.

How to do so? Why, there is perhaps, no explaining; the two words *Do it*, cover the whole matter. This universe is neither unconscious nor dead; but pulsing through its veins is everlasting life. We human beings, again, are not drift and flotsam on a shoreless sea: we are not oddments nor rootless growths, though our root and essence be unseen. Behind our life is universal life; we are the branches, and the True Vine is Deity. Chaos was turned into cosmos and the stars and worlds awoke, precisely in order that an infinite amount of work might be done. Through all the actions of all the innumerable living things in all inhabited regions and the wide sweep of space, Spirit of Life is contacting matter, feeling and molding it, getting pain and pleasure from it, learning at last to dominate and refine it; reaping unceasingly experience, experience: and for this reason we inhabit the world.

We are all rays from one universal sun; wherefore we ought to think of that sun, and forget these prisons in which we have been caught. Turn your hands to the performance of some work, and you are letting loose a flow of force upon the world. The thought comes to a head within you, and translates itself along the nerves and muscles, and runs down through whatever tool you may be using, and transforms the material upon which you may be at work. Whatever it is, the world has been somewhat changed by it. If it has been rightly done, something more of order and harmony has come about; the boundaries of chaos have been moved back, if only an inch or so, and that much more of Cosmos has been brought into being.

You may say that skilful work is of equal value, with whatever motive it may have been done; but in reality this is not so. There is a difference as wide as the world, as wide as that between help and hindrance. Think, two organized bodies of men may be equally perfect; their discipline and alertness may be alike; and yet one of them is for the service of humanity, and the other for bomb-throwing or the devil's own ends. You would not compare the two, or say there was no choice between them? All that the one touches will be health-giving and clean; all that comes from the other will be loaded down with suspicion, rancor, waste. So it is with our work. Plow an acre of land, and you make the soil pregnant as you go. All the atoms of it are infinitesimal lives, and you may lift these, you may thrill them through with a heightened spirituality; or cumber them up with indifference, or infest them with positive evil dreams. The fact is that at each moment as we work we are drawing currents through ourselves; they come out of the infinite, and pass through us, they have their exit into, and their inevitable effect upon, the world. And they leave their stamp upon ourselves; we are what they make of us. A man's personality is like the shifting bed of a river that changes its shape continually as the water wills. Do a piece of work for your own sake, and it has confirmed you in the narrow confines of selfhood; do it

with sloth and indifference, and it has stamped *Sluggard* on every atom of your being; do it for the great Gods, and it has made you like unto them.

So then it is by this royal method that we can be made free; work is Apollo and Pallas, refuge from the Furies—she who will transform them into doers of service, goddesses of beneficence and light. It is the currents that can be drawn down out of infinity and driven through mind and heart that can wash away the filth and septic stuff in the memory, and restore clean health and soundness. However hard you may work for yourself, it will not profit you in this respect. For your mind may then have no traffic with the bitter memories, while you are, so to say, standing over it with a whip, but it is gaining no health nor sweetness, and longing for you to stop tyrannizing, that it may rest. Once turn away, and it will be out open-armed towards that old mad dance and riot of remorse; for it desires life, and can get at least sensation, the imitation of life, from the whips and snakes of the Furies.

Work for humanity is Pallas, who transmutes the Furies—the old mistakes that now haunt you may become priceless pearls of experience without which you were bereft of half your power of service. K. V.

INQUIRER. The you regard self-sacrifice as a duty?

THEOSOPHIST. We do; and explain it by showing that altruism is an integral part of self-development. But we have to discriminate. A man has no right to starve himself to death that another man may have food, unless the life of that man is obviously more useful to the many than is his own life. But it is his duty to sacrifice his own comfort, and to work for others, if they are unable to work for themselves. It is his duty to give all that is wholly his own and can benefit no one but himself if he selfishly keeps it from others. Theosophy teaches self-abnegation, but does not teach rash and useless self-sacrifice, nor does it justify fanaticism.

INQ. But how are we to reach such an elevated status?

THEO. By the enlightened application of our precepts to practice; by the use of our higher reason, spiritual intuition, and moral sense; and by following the dictates of what we call "the still small voice" of our conscience, which is that of our Ego, and speaks louder in us than the earthquakes and the thunders of Jehovah, wherein "the Lord is not."

INQ. If such are our duties to humanity at large, what do you understand by our duties to our immediate surroundings?

THEO. Just the same, plus those that arise from special obligations with regard to family ties.

INQ. Then it is not true, as it is said, that no sooner does a man enter the Theosophical Society than he begins to be gradually severed from his wife, children and family duties?

THEO. It is a groundless calumny, like so many others. The first of the Theosophical duties is to do one's duty by *all* men, and especially by those to whom one's *specific* responsibilities are due, because one has either voluntarily undertaken them—such as marriage ties—or because one's destiny has allied one to them—such as those we owe to parents or next of kin.—*The Key to Theosophy* (H. P. Blavatsky)

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

The Ecclesiastical Babel

The Church as A Business

A CLERGYMAN holding an official position in his church has written a treatise on *Principles of Successful Church Advertising*, which is said to contain just the technical information needed in promoting the welfare of the modern church. It is persistent advertising, says the clergyman, that makes the church popular. The steady rhythmic blow counts; a pugilist once told him that he always found his opponent's weak spot and then showered blow after blow upon it. In church advertising the emotions should be appealed to, and the reader's "curiosity, sympathy, wonder, pride, admiration, religious feeling," aroused. The advertising must not beg and appeal, it must command; for men have a natural tendency to do the thing that is shouted at them. The short "shop talk" style of advertising is most favored; examples are given and the book enters into details about the psychology of advertising and many other points.

From another paper comes an account of a minister who has resigned his position in order to go into the automobile business, because his salary, though by no means small as ministerial salaries go, was not large enough for him. He had contracted debts which he could not pay; the automobile business promised him a much larger salary, so that he could pay these debts and keep his family in comfort.

The Church as a Political Machine

A CORRESPONDENT to a newspaper gives his views as to why candidates for the ministry are now so rapidly decreasing in all countries and all denominations. It is because they refuse to become "ecclesiastical-political parasites or educational parrots." The pulpits of the present day are, he says, denominational echoes and political pulls. The man who wishes to keep his pulpit must be a consummate politician, able to place a comma or a dollar where an ecclesiastical czar says he should. The pulpits of the present day know more about cotton centers, hog centers, etc., than they do about Christ. And then the writer gives a picture of the crime, misery and vice that are everywhere.

One may agree with him as to the facts, but scarcely in regard to the outcome and

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

remedy which he forecasts. He expects a great revival of undenominational evangelism, and mentions Moody, Booth, Gipsy Smith and Bill Sunday as specimens of the kind of men who are to lead it. One can hardly imagine, however, that this kind of influence has any more real vitality in it than the churches, or that it can avail to remove the social evils. No doubt the new wine will, as the writer says, burst the old bottles and sweep away the denominations; but the outburst of Gipsy Smiths and Bill Sundays we should prefer to regard as representing the spilling of the wine. The new bottles will have to be of more sterling stuff. New organizations cannot be forced upon the people; they must grow naturally in response to the people's call. A church is primarily an invisible organism knit of the hearts and minds of its members, who find their solidarity in a common recognition of the truth. As the light of Theosophy spreads and people become conscious of their power to find the Light *within themselves*, this invisible church will grow; and, if an outer organization is needed, it will grow up naturally around the invisible organization.

China and Japan to Teach us Christianity

A CONGREGATIONAL minister near Boston predicts that by 1950 the Chinese will be one of the leading Christian powers. He holds the absurd view that Christianity is God's last step in the education of his children, the crowning touch to all preceding religions; and that Christianity will supersede the religions of the East as (he says) it superseded those of Greece and Rome. But he considers that God will teach us, through the Japanese and Chinese forms of Christianity, some things we have not yet been able to tolerate.

No one competent to take a proportioned and unprejudiced view of world-history can regard Christianity as ranking any higher than a religious episode in the life of certain recent nations, nor view our civilization as standing triumphantly at the summit of all past at-

tainment. Nor will anyone with an adequate conception of Deity venture to chalk out the limits of the divine program by allowing Deity latitude within certain limits. The recent rise of China and Japan has had something to do with this enlarged conception of the intentions of God; but it is surely possible that the intentions may be larger yet.

There seems little doubt that the Japanese and Chinese are investigating the advantages and disadvantages of Western culture, including Western religion, and that they will adopt just so much of it as they deem useful to their purposes. It is quite likely, too, that they will infuse into Christianity a new life and vigor and round it out with additions from other Oriental religions. Thus we may have a backwash of missionary enterprise, and Chinese missionaries preaching Christianity to the people of London and Boston.

Jesus Came to America After the Crucifixion

So says a member of the "Quorum of the Presidency," in the Church of the Latter-Day Saints. He relies on the Book of Mormon, which was delivered to Joseph Smith by God and Jesus Christ under a certain tree near Palmyra, N. Y., "in the early part of this century." (We may advise the Elder that we work-a-day folk outside his Church are already well on in a new century.) The revelation is harmonized with existing facts in a manner that one could not much have improved upon oneself. The first American colonies came from Shinar at the time of the building of the tower of Babel. They became a mighty people, built magnificent cities, and were destroyed. Six hundred years before Jesus another colony came from Jerusalem, and became divided into two leading nations, called Nephites and Lamanites. They fought a decisive battle at Cumorrah, N. Y. Some time afterwards a prophet named Mormon prepared the records and handed them to his son Moroni, who deposited them in a stone box where they were found by Joseph Smith. The members of the second colony were descendants of Joseph of Egypt, which was why Jesus came to them. The American Indians are Israelites. (One wonders how they like having their affairs managed for them like this, and whether any cranks among them have provided us with a Red Indian lineage.) The

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

LAST Sunday being the fourteenth anniversary of the vindication of William Q. Judge at the annual Convention of the Theosophical Society held in Boston April 25th and 26th, 1895, a special tribute was paid to his life and work at the meeting of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY at Isis Theater. The meeting was in charge of the Rāja Yoga students, and one of the young speakers gave a very interesting account of Mr. Judge's life, while another of the young students read extracts from Mr. Judge's writings.

After enumerating the chief events of William Q. Judge's life, the former of the speaker's said: How can we in words render fitting tribute to this great man? His whole life was devoted to deeds, deeds of heroic self-sacrifice, deeds that had ever as their motive the love of all humanity, and a determination to preserve the light at any cost.

Of Mr. Judge it has been said that in working for the cause of Brotherhood, "he brought to bear his great powers one by one, as an organizer, a business man, a reformer, a writer, a tactician, a warrior, and a counsellor."

In our day of specializing all can readily appreciate what a strong character is needed to live a life in which all the elements and faculties of the human being are utilized. Yet such must be the experience of the great Teachers who give their lives for humanity. They must have the knowledge of all the phases of life and feel sympathy for all, whatever their walk in life may be. And so we find the nature of that royal soul, William Q. Judge attuned to all the grandest and noblest things of life. Not one of the thousands who scoffed at and persecuted him could approach the heights on which he stood, yet such was the grandeur of his soul that he lived his whole life for the uplifting of those in the shadows, and for the lessening of the world's woe, shedding a radiance wherever he went.

And when the time came that he must lay aside his worn-out garb of flesh, he turned over the Movement to Katherine Tingley, having been faithful to his trust. He had nurtured the seeds sown by Madame Blavatsky, and had prepared the ground for the glorious harvest to be reaped by those who should come after.

OBSERVER

The Ecclesiastical Babel

(CONCLUDED FROM PAGE 10)

Lord cursed their skins with a copper color — "the color of blood" — because they were so partial to fighting. (The God of the Israelites in our Old Testament narrative was rather partial to war and bloodshed; also he seems to have made a failure in matching the color, unless blood in those days was copper-colored.)

The discovery of America, with the inhabitants of remote descent and its ancient temples, considerably upset many theological ideas; and Joseph Smith seems to have made a laudable attempt to obviate the difficulty. Are such prophets conscious impostors? Not necessarily; for it is possible for people to have psychic visions which may really be no more than an interpretation of their own wishes and ideas, or of those of their followers; and vanity and ignorance would make them mistake the source of these visions. H. T. E.

The Mahābhārata of India

ONE cannot do better than introduce this sketch of India's great Epic in the words of Sir Edwin Arnold, who prefaces his translation of the last two *parvas* (or books) of the Mahābhārata into English verse with a short description of the whole poem or series of poems.

There exist certain colossal, unparalleled epic poems in the sacred language of India, which were not known to Europe, even by name, until Sir William Jones [in 1879] announced their existence; and which, since his time, have been made public only by fragments, by mere specimens — bearing to those vast treasures of Sanskrit literature such small proportion as cabinet samples of ore have to the riches of a mine. Yet these twain mighty poems contain all the history of ancient India, so far as it can [yet] be recovered, together with such inexhaustible details of its political, social, and religious life that the antique Hindū world really stands epitomised in them. The Old Testament is not more interwoven with the Jewish race, nor the New Testament with the civilization of Christendom, nor the Qurān with the records and destinies of Islām, than are these two Sanskrit poems the Mahābhārata and the Rāmāyana with that unchanging and teeming population . . . of Hindūstān.

The stories, songs, and ballads; the histories and genealogies; the nursery tales and religious discourses; the art, the learning, the philosophy, the creeds, the moralities, the modes of thought; the very phrases, sayings, turns of expression, and daily ideas of the Hindū people, are taken from these poems. Their children and their wives are named out of them; so are their cities, temples, streets, and cattle. They have constituted the library, the newspaper and the bible — generation after generation — to the succeeding and countless millions of Indian people; and it replaces patriotism with that race and stands in stead of nationality to possess these two precious and inexhaustible books, and to drink from them as from mighty and overflowing rivers.

The value ascribed in Hindūstān to these yet little-known epics has transcended all literary standards established in the West. They are personified, worshiped, and cited from as something divine. To read, or even to listen to them is thought by the devout Hindū sufficiently meritorious to bring prosperity to his household here and happiness in the next world.

As all deeper students of Theosophy know, the great world-epics, with their cosmogonies and anthropologies, contain the real inner history, from various points of view, of Universal Mankind, to which the Secret Doctrine of Theosophy gives the keys, and the elucidation of whose meaning is the work of future Theosophical scholars and historians. A concluding passage of the poem under consideration says:

This Mahābhārata contains the history of the gods, of the Rishis in heaven and those on earth; of the Gandharvas and Rākshasas [celestial beings concerned in the evolution of our system]. It also contains the life and actions of the One God, holy, immutable, and true, who is Krishna, who is the creator and the ruler of this universe [and who says in the *Bhagavad Gītā* that he "dwelleth in the hearts of all men"]; who is seeking the welfare of his creation by means of his incomparable and indestructible power; whose actions are celebrated [i.e., *performed*] by all sages; who has bound human beings in a chain, of which one end is life and the other death; on whom the Rishis meditate, and a knowledge of whom imparts unalloyed happiness to their hearts and for whose gratification and favor [realization] all the daily devotions are performed by all worshipers. If a man reads the Mahābhārata and has faith in its doctrines [to realize them], he becomes free from all sin.

The Mahābhārata, or the "Great War of the Sons of Bhārata," deals with the feud between the five sons of "King Pāndu the Pale," who are thence called the Pāndavas,

and their cousins, the five sons of "King Dhritarāshtra the Blind," called the Kauravas, who are the elder branch of the descendants of Bhārata. Yudhishtira, Bhima, Arjuna, and the twins Nakula and Sahadeva are the Pāndus or Pāndava Princes. Duryodhana is chief of the Kauravas. The cousins are brought up together in the palace of Hastināpura and are instructed by one master, Drona, a Brāhman, in the arts of war and peace, learning to fight, to manage cattle, to hunt wild animals, and to tame horses.

In the early portion there is a vivid picture of an Āryan tournament, where, "highly arrayed, amid vast crowds," the cousins show their prowess, Arjuna especially distinguishing himself. The Kauravas, becoming jealous of the prowess and popularity of the Pāndava princes, bring about a division of the kingdom, contriving to have the Pāndavas sent away to Vachanāvāt, now Allahābād.

Arrived there the princes hear of the marvelous beauty of Draupadi, whose *Swayamvara*, or "choice of a suitor," is to be celebrated at a tournament at Kāmpilya. This furnishes another wonderful picture of the old times, full of life and color. Thither the Pāndava brothers repair, and Arjuna, disguised as a Brāhman, surpasses all the contestants, his youth and grace winning the heart of Draupadi more completely than his skill had inclined her mind toward him.

The brothers now ally themselves to Draupada the father of Draupadi, and becoming strong, excite the fears of the Kauravas, who, for safety's sake, invite them back to Hastināpura, assigning them the city of Indraprastha, now Delhi, which under their beneficent sway becomes prosperous and full of joy.

Yudhishtira, who has been chosen king of the Pāndavas, performs the wonderful *Rājasūya*, or "Ceremony of Supremacy," the magnificence of which inflames the jealousy of the Kauravas. Furious at the power and good fortune of his cousins, Duryodhana invites them to a great gambling festival at Hastināpura, where, Śakuni having loaded the dice, the Kauravas win every throw. One after another Yudhishtira stakes all his possessions, until he has lost the whole of his kingdom except the lands granted to the Brāhmins. He then madly stakes Draupadi the Beautiful, and loses her also. Duryodhana, mocking her, drags her away by the hair; but the blind old king intervenes, restores Draupadi, and decides that they must throw another main, the losers to leave Hastināpura, go away into the forest, and let no one know their names for 13 years. Again the Pāndavas lose the throw. As they depart, Draupadi unbinds her long hair and vows never to bind it up again until the hands of Bhima, the strong man among the Pāndavas, are red with the blood of the Kauravas.

After long adventures in the jungle, which are described in full, the Pāndavas in disguise enter the service of King Virāta. Draupadi becomes the handmaid of the queen, Arjuna is disguised as a eunuch, Bhima becomes the palace wrestler, the twins Nakula and Sahadeva, with Yudhishtira the king, acting as herdsmen and attendants, their adventures being most dramatic and absorbing.

The Kauravas, suspecting the presence of their cousins, attack Virāta, but Arjuna victoriously repulses them with his awful bow Gāndiva. Virāta thus discovering the princely

nature of the Pândavas, a council of war is held at which it is decided to demand restitution of the Kauravas, or make war upon them in the event of a refusal. Both Arjuna and Duryodhana seek the aid of the god Krishna, who, hearing their petitions, offers to place his vast army at the service of one, and himself be counsellor to the other. Duryodhana selecting the army, Arjuna has the best of the bargain by having the assistance of Krishna himself. Then a great deal of negotiation goes on, Draupadi meanwhile vehemently protesting, and crying: "War! War! No Peace! Peace is to me a war!" Krishna comforts her and assures her of the approaching end of the Kauravas.

The Kauravas deciding upon war, the plain of Kurukshetra is selected as the scene of conflict, the whole chivalry of India, upwards of two millions of warriors in full panoply of war, being engaged. It is here, at the commencement of the fight, that the interlude of the *Bhagavad Gîtâ*, "The Song Celestial," occurs. Indeed, during the eighteen days of the fighting, interruptions and episodes lengthy, eloquent, and philosophic, are constantly interjected. Essays on laws, morals, and the sciences are grafted on the most important parts with lavish indifference to the continuous flow of the narrative; but there is, notwithstanding, "enough of solid and tremendous fighting to pale even the crimson pages of the Greek Iliad." The field glitters with the enormous hosts; with kings and princes in gorgeous array of gold and jewels, who engage in mighty and varied combats until the earth swims in blood and the heavens themselves are obscured with the dust and flying weapons. One by one the Kaurava chiefs are slain, Arjuna and his party are completely victorious, and Yudhishtira is proclaimed king.

The martial strain soon softens. The dead have to be duly buried and the living reconciled to their new lords.

Then follows the magnificent "Sacrifice of the Horse," of which Arnold says: "It is difficult to raise the thoughts of a modern Western public to the solemnity, majesty, and marvel of this ancient Oriental rite." We must, however, refrain from any description of this great ceremony, merely mentioning that it includes a whole year of marvelous romantic or mystic adventures among dazzling Amazons, terrible Snake-people, and the like, at the end of which the host returns with a vast train of vanquished monarchs and great treasure.

The great Saint Vyâsa now reveals to the Pândava princes the souls of the dead in the invisible world. In this terrible revelation, the madness of war and the folly of all earthly things is shown to them. This brings us to the last two *parvas*, the most wonderful and beautiful of the whole series of epics constituting this marvelous poem. Arnold describes these concluding portions of the *Mahâbhârata*, which, as said, he has translated in full into English verse, as:

One of the noblest religious apologues not only of this great epic but of any creed; a beautiful fable of faithful love which may be contrasted to the advantage of the Hindû teaching with any Scriptural representation of Death, and of Love "which is stronger than Death."

One would willingly linger over these beautiful episodes as given in Arnold's fluent verse; but the very briefest account must suffice.

These two concluding *parvas* deal with the renunciation by King Yudhishtira and his brethren of all earthly glories and affairs, and their journey with Draupadi (followed by the weeping people until the king dismisses them), to the sacred Mount Meru. On the way, the god Agni, who afterwards conducts them for a part of their journey, demands the return to the gods of the holy bow Gândiva with its inexhaustible quiver, now that the purpose for which it was lent is accomplished. Arjuna accordingly casts it in the sea. Then, passing round "a main loud-thundering on its shores," they reach the last stage of their journey, "a wide waste of sand, dreadful as death." One by one the princes fall in the toilsome progress, until at last Yudhishtira, accompanied only by a faithful hound, stands before the gates of Paradise.

Finding that he must leave his lowly companion and enter heaven alone, the king refuses to abandon the poor creature, who has no other friend left. The heavenly watchman asks the king why he lingers for a mere brute, since he had never faltered or stayed when one by one his brethren had fallen in the sandy waste. To this the king replies that they had died in the quest and would reap their reward, and that he could not have helped them by staying; but to abandon the helpless hound would be the direst of sins. The utmost arguments are urged, but in vain; the king remains firm, and finally the dog turns into Dharmâ, the Lord of Justice, who had thus tried the perfect king even to the uttermost, as it would seem.

But greater heights of compassion and renunciation are possible to this peerless monarch, the human soul crowned with its divinity. Entering heaven, whose beauties are described in glowing Eastern imagery, Yudhishtira sees his ancient foe Duryodhana enthroned among the high gods. He passes on, searching for his brothers who had fallen at his side on the last, long, and difficult ascent. Everything is done to make him rest content with the bliss he has won, "where none shall sit above thee"; but he demands ever to be led to his brothers in arms, for without them what were Paradise itself and even the company of the Gods?

A shining messenger is appointed to lead the king to his comrades. Passing out of the pearly gates, turning to the left, downhill, they pass along through nameless and unimaginable horrors whose depths of woe can only be suggested by the most frightful images of gloom, torture, and stench. Even the unconquerable Yudhishtira almost quails amid the throbbing agonies of the hells. His guide offers to lead him back to the gods and the king turns his face heavenward. The hells ring again with the piteous cries of the tortured souls praying the king to linger a little while, for cooling breezes blew and the agonies of hell were assuaged while his presence shone in the gloom. Asking who were they, who chained in deepest hell, implored his aid, the king doubts if he is crazed with woe as the voices of his brothers and Draupadi fall upon his amazed soul. "Burning terrible with tenderness," Yudhishtira bids his angel guide, return to those who sent him, saying:

"Tell them I come not thither. Say I stand
Here in the throat of Hell, and here will bide—
Nay, if I perish—while my well-belov'd
Win ease and peace by any pains of mine."

When the messenger returns with the tid-

ings of this matchless resolve, the whole shining cohorts of heaven, each Splendid Presence in his place, led by Sakra chief of the gods, are fain to quit Paradise, shall we say in homage to this divinely human compassion? Leaving heaven they gather smiling around the steadfast king in hell; they show him how the demands of the Law must be fulfilled and the souls whose perfection is not flawless must be assailed by a sojourn in hell; that he may lay his "loving wrath" aside, for "*even they who sorely sin and suffer quit their debt at last.*"

At the presence of the assembled gods, saints, and heroes, hell itself is transformed and fades away like the baseless fabric of a vision; and the gods, Yudhishtira, his brothers, and the peerless Draupadi, together with all the warriors who had lived and fought and died for the king, return to heaven, where, putting off the mortal body for celestial robes, hand in hand with brother-gods, the glorified king, heralded by sweetest strains of unknown music, passed on forevermore with all his lovers.

Future Cities

A BOSTON architect, looking forward forty years, thinks he sees New York with a population of 20,000,000 and lesser cities correspondingly teeming. How will these people be housed? Cities cannot grow sideways to cover counties; they must grow upward. The problem is that of the skyscraper. Can these structures be made wall-in deep Cañons of still and putrid air threaded by unlit and poisoned people?

His plan, of which he gives a sketch, is the tower principle. Huge square towers will arise, covering at their bases the entirety of great blocks. At the height of about 100 feet "the wall of the next section of the building would be set back thirty or forty feet, forming a broad, sunny, asphalted promenade, free from dust or noise of traffic, possibly partly sheltered by arcades or glass canopies, bordered by fine shops or cafes," and ornamented by trees in tubs, statuary, kiosks, etc. At the height of another 100 or 150 feet there would be a second similar promenade, the tower converging to its apex and white marbled all over. All wheel traffic would be done below, none of it on the promenades, and horses would be obsolete. The lower stories would be devoted to business, and would be little if at all darker than now; the upper to dwelling.

Here is a solution of the difficulty—of a sort. But many things may happen in forty years. With perfected means of communication, running as far ahead of modern telephony as this of telegraphy, country life may reassert its claims. With perfected means of transit, lateral instead of vertical growth of cities may please us better; and other changes may make this possible. In fine, you cannot now confidently draw lines into the future from the past. Any day they may get bent in surprising fashion and the beginnings of entirely new ones appear in replacement of old.

The fallacy underlying the vertical proposition is sufficiently proven in great cities where the business quarters are deserted at night. And, but for the gambling fever, close proximity of business quarters would be needless. Low buildings, wide spaces, phones, rapid transit—health! Such may be part of the general program ahead.

The Jailer and the Gillyflower

(From "Picciola" prize story by Joseph Xavier Boniface, a French writer, better known as "Saintine," born 1707.)

A LESSON for those who plead duty as an excuse for unkindness or as an obstacle to humanity; and an illustration of how an individual of fine character may communicate the heart-touch, even in the most adverse relationships. This rough jailer, by his touch of gold, turns the Count's prison into a palace; and if every man and woman who boast an individuality did their duty like him, there would be no need of prisons. **STUDENT**

The Count, who is in prison for a political cause, and is not allowed books or paper to beguile his solitude, has found one little green plant growing up between the paving-stones of the prison-yard in which he is allowed to walk. He watches it from day to day, marks the opening of the leaves and buds, and soon loves it as a friend. In dread lest the jailer, who seems a rough man, should crush it with his foot, he resolves to ask him to be careful of it; and this is the conversation they have on the subject:

"As to your gillyflower"—

"Is it a gillyflower?" asked the Count.

"Upon my word," said the jailer, "I know nothing about it, Sir Count; all flowers are gillyflowers to me. But as you mention the subject, I must tell you, you are rather late in recommending it to my mercy. I should have trodden on it long ago, without any ill-will to you or it, had I not remarked the tender interest you take in it, the little beauty!"

"Oh, my interest," said the Count, "is nothing out of the common."

"Oh! it's all very well; I know all about it," replied the jailer, trying to wink with a knowing look; "a man must have occupation—he must take to something—and poor prisoners have not much choice. You see, Sir Count, we have among our inmates men who doubtless were formerly important people; men who had brains—for it is not small-fry that they bring here; well now, they occupy and amuse themselves at very little cost I assure you. One catches flies—there's no

harm in that; another carves figures on his deal table, without remembering that I am responsible for the furniture of the place."

The Count would have spoken, but he went on:

"Some breed canaries and goldfinches; others, little white mice. For my part, I respect their tastes to such a point, that I am

replied the Count, feeling uneasy that he should be thought capable of caring for such trifles; "but this plant is for me more than an amusement."

"Never mind, if it only recalls the green boughs under which your mother nursed you in your infancy, it may overshadow half the court. Besides, my orders say nothing about it, so I shall be blind on that side. If it should grow to a tree, and be capable of assisting you in scaling the wall, that would be quite another thing. But we have time enough to think of that; have we not?" added he with a loud laugh. "Oh, if you tried to escape from the fortress!"

"What would you do?"

"What would I do? I would stop you, though you might kill me; or I would have you fired at by the sentinel, with as little pity as though you were a rabbit! That is the order. But touch a leaf of your gillyflower! no, no; or put my foot on it! never! I always thought that man a perfect rascal, unworthy to be a jailer, who wickedly crushed the spider of a poor prisoner; that was a wicked action—it was a crime!"

The Count was touched and surprised. "My dear jailer," said he, "I thank you for your kindness. Yes, I confess it, this plant is to me a source of much interesting study."

"Well then, Sir Count, if your plant has done you such good service," said the jailer, preparing to leave the cell, "you ought to be more grateful and water it sometimes; for if I had not taken care, when bringing you your allowance of water, to moisten it from time to time, the poor little flower would have died of thirst."

"One moment, my good friend," cried the Count, more and more struck at discovering so much natural delicacy under so rough an outside; "what, you have been so thoughtful of my pleasures, and yet you never said a word about it? Pray, accept this little present, in remembrance of my gratitude;" and he held out his silver drinking-cup.

The jailer took the cup in his hand, looking at it with a sort of curiosity. "Plants only want water, Sir Count," he said; "and one

ALBRECHT DÜRER

happy to gratify them. I had a beautiful, large Angora cat with long white fur. He would leap and gambol in the prettiest way in the world, and when he rolled himself up to go to sleep, you would have said it was a sleeping muff. My wife made a great pet of him, so did I. Well, I gave him away, for the birds and mice might have tempted him, and all the cats in the world are not worth a poor prisoner's mouse."

"That was very kind of you, Mr. Jailer,"

To live to benefit mankind is the first step; to practise the six glorious virtues is the second.—*Voice of the Silence*

The Mighty Army

WE sometimes think of Right and Wrong as opposing armies. There is but one: the army of Right, "a body of men enlisted, brought together, drilled and armed for warfare."

Opposing the mighty army is an armed force: the Wrong; but it is no real army. It is an undrilled, grotesque, heterogeneous body, at war not only with the army of Right, but also with itself, and each unit within it is at sword's point with all the rest. Were it possible for this force, as a whole, to take possession of the earth, there would be no victory and no rest from warfare, so long as spoils remained to be divided and subdivided.

The mighty army moves toward peace, triumphant at every step, and assured of victory from the beginning of the conflict. Each unit there knows himself to be invincible, through the united fighting strength of his unconquerable brothers. There the protective swords of loyal warriors, great and lowly, flash like flames around the daring, rescuing, ever-victorious general, venturing at times across the line of battle.

All along the line are determined individuals, sure of *their* invincibility, in various stages of stepping out, preparing for re-enlistment, drilling, recalling forgotten rules of noble warfare, and at last re-entering the ranks of the army of Right. Around these the hottest battles are fought. Long association with the forces of Wrong makes the struggle of separation fierce and bitter; but kinship with the princes of the mighty army draws them more strongly than all that long living-together with foes.

After all, it is only the mighty army that really knows that it is fighting. Within the other body there are janglings, resentments, hatreds, killings, and oppositions of many names; but of real warrior's work there is not any. Triumphant joy possesses the army of Right after each conquest, each coming

From THE FRIEND'S BURIAL

O SWEET, calm face that seemed to wear
The look of sins forgiven!
O voice of prayer that seemed to bear
Our own needs up to heaven!

How reverent in our midst she stood,
Or knelt in grateful praise!
What grace of Christian womanhood
Was in her household ways!

For still her holy living meant
No duty left undone;
The heavenly and the human blent
Their kindred loves in one.

And if her life small leisure found
For feasting ear and eye,
And Pleasure, on her daily round,
She passed unpausing by,

Yet with her went a secret sense
Of all things sweet and fair,
And Beauty's gracious providence
Refreshed her unaware.

She kept her line of rectitude
With love's unconscious ease;
Her kindly instincts understood
All gentle courtesies.

An inborn charm of graciousness
Made sweet her smile and tone
And glorified her farm wife dress
With beauty not its own.

The dear Lord's best interpreters
Are humble human souls;
The Gospel of a life like hers
Is more than books or scrolls.

From scheme and creed the light goes out,
The saintly fact survives;
The blessed Master none can doubt
Revealed in holy lives.

John Greenleaf Whittier

back into place of old-time comrades, and over in the disordered ranks of the enemy, there is merely a little less to quarrel about; there is a gap that will never be filled. The victory of the mighty army is for all. STUDENT

What Can We Know?

IN the eyes of the children when they begin to question us about life and death we read our own ignorance; but, when we consider how for ages these questions have been evaded or answered incompetently, it is a reasonable conclusion that *sometime, somehow*, there must be satisfactory replies to be made to them, that, in fact, the persistence and the recurrence of this interrogating of parents argues the existence of the *power* to know. The most vital points are those usually dwelt upon by the little ones. It would seem that long ago we might have guessed that their questions were asked because they can be answered, and should be answered satisfactorily. If we had had the knowledge Theosophy has brought us we should long ago have realized that children, not being new souls, but old souls returning to earth-life fresh from a glorious consciousness where divinity was felt and known, really are better able to tell what we ought to know than are we, who have passed beyond the age of childhood without retaining the belief in the higher nature, which is one with all knowledge and godhood. The little ones are challenging us to tell them what we ought to know and ought to be able to impart to them in such a way that what the Soul knew before birth may not be lost to the mind when the coats of flesh once more imprison the reincarnating Ego.

It is a humiliating thought that we have so long had a set of phrases that have done duty in checking the natural wonder of children and so diverting their minds from the realities involved in their questions to some conventional idea incomprehensible to them, that they quickly realize their parents' ignorance, cease their interrogations, gradually cease to wonder, and settle down to a limited conception of the powers and possibilities of human beings. Nobody for so long knew anything about God, or man, or the universe, or life, or death, great and true enough for a child to under-

stand. It is terrible to think of — this gradual contraction and belittling — the natural expansiveness of childhood given nothing to enable this quality to remain with the child. When it has gone the mind may search and comprehend, but the power of the Soul to include and to shed the radiance of its wisdom upon all subjects has receded.

Even knowledge of Theosophy, which explains all the vital points inevitably brought up by children in their questions, will not suffice, unless those who know something of these great teachings are endeavoring to live in accordance with them. The mind cannot answer the Soul; and it is often the very Soul of the little one that leads him to seek in some one in the new environment he has entered, an explanation of it. If he be answered by one awake to soul-wisdom and alert in mind, a step in his education has been taken; he is being adjusted to the conditions of earth-life by one who knows its place in the cycle of development; his mind remains open to the light from above: the true relation of parent and child, or teacher and child, is realized. But this is seldom the case. The majority of parents are themselves living in a way they would not care to explain to their children, and what they are not *living* they lack the proper illustrations to explain — for it is the life that counts, and beyond what they are making a power in their own lives they can not *lead* their children. The power of the parent or educator is limited by his or her own achievement in self-conquest and the resulting self-knowledge.

When Theosophy is being studied by parents and children both, and applied earnestly to their lives, a new era opens for the family. The questions:— *Who am I? Where did I come from? What am I here for? Where is God? Do you know God? Why did I come to you? Where are people after they die?* having been satisfactorily answered to the parents, the children profit by their knowledge, and the understanding of life it has brought them. Thus the truths of Theosophy, so grand and comprehensive, so inclusive of all that the Soul aspires to, are spread before the young minds, fostering wonder and reverence, belief in the divinity and immortality of the Soul, and exhibiting a harmony with all that the child loves in Nature's realm. The restoration of unity — of the ideal and the growing realization of unity, which is effected where Theosophy, with its teaching of compassion and brotherhood, and its survey of all life, is being daily applied — is the keynote in an environment that fosters the higher human powers; and this unity awakens the power to *know*, so

long heralded by the pleading for knowledge.

The wide scope offered to human beings by the teachings of Theosophy is quickly verified as actually existing, awaiting their recognition of it and their assumption of compassionate powers, which can be exercised in full vigor only when these grand conceptions of life and destiny are reached. To see children growing up unhampered by petty conceptions of life and its purpose, and expanding by a kind of rhythmical progression as they grow and learn life's opportunities: to see children question-

Jottings and Doings

(From a Student's Note-Book)

NEW avenues for earning a living seem to be constantly opening up for the blind, and blind girls and women are eagerly entering them. Two of the latest are type-writing and telephony. Many are earning a competence at the type-writer, the work being given them either by dictation or through the medium of a phonograph, and their work is noted for its neatness and accuracy. Stenography is also possible to them by means of a stenographic machine, and recently an Eastern association organized for the aid of the blind has been successfully teaching blind girls to operate telephone switchboards, a number of such operators being now regularly employed in New York City.

In Lynn, Mass., is a blind librarian who not only attends to the duties of her position but, outside of hours, spends her time in teaching others as unfortunate as herself to read books for the blind.

THE following, from an editorial in a contemporary, certainly has its application today and is most Theosophical in tone, for as H. P. Blavatsky so insistently reminded us: "Theosophy is the quintessence of duty," and she said the great ideal was "to do one's whole duty by every duty."

Save in very exceptional cases no public service by a woman who is wife, mother, or either, is comparable in importance with her duty to her family, and while no enlightened person in this age and country advocates the woman burying herself in the home and restricting her activities wholly to it, there is a giving to each its due which it is most desirable in this day of urgent appeals for social service that she should appreciate. The doctrine of universal brotherhood is a beautiful ideal, but it can never be realized, or its day of general acceptance hastened, by neglect of obligations that lie nearest at hand. Nor is there any merit in spending time and substance helping to spread the gospel of good fellowship at the expense of nearer claims.

Jailer and Gillyflower

(CONCLUDED FROM PAGE 13)

can treat them to a drink without ruining oneself. If this one amuses you, if it does you good in any way, that is quite enough;" and he went and put the cup back in its place.

The Count advanced toward the jailer, and held out his hand. "Oh, no, no!" said the latter, moving back respectfully as he spoke; "hands are only given to equals or to friends." "Well then, be my friend."

"No, no, that can not be, sir. One must look ahead, so as to do always tomorrow as well as today one's duty conscientiously. If you were my friend, and you attempted to escape, should I then have the courage to call out to the sentinel. 'Fire!'? No; I am only your keeper, your jailer, and your humble servant."

OUR YOUNG FOLK

Jean-François Millet

JOAN OF ARC, the young girl who was made general of the armies of France, and led them on to victory, thus saving her country, was a French peasant. So was Jean-François Millet the great French artist of the 19th century, who painted so many noble and true pictures of peasant life.

Peasants are those people who for hundreds of years have lived in the country, far away from cities. They till the soil, raise the crops, and tend the flocks of sheep and herds of cattle. Their life is quiet and simple, and filled with hard work in the fields. It is also very beautiful to those whose hearts know its true meaning.

Jean-François Millet knew this true meaning. Until he was twenty years old he lived in his little peasant home in the north of France, near the seaport of Cherbourg. He had an honorable, hardworking father, who taught him to admire what was good and true. He had a mother in whose family there was wit and intelligence; and a dear grandmother, who had taken care of him when he was a tiny boy, while his mother worked in the fields. She was strong and loving and watchful. She was Jean-François' best friend. He also had several brothers. There was an uncle, too, on his mother's side, who was a *curé* or priest. He was simple and true hearted, like the rest of the family, and he took a great interest in little Jean-François. He taught him to read, to write, and to think. He taught him Latin so that he could read and understand the Roman poet Virgil. He also let him see books with fine engravings in them and look at the pictures all by himself. Happy Jean-François! Those wonderful pictures were the gateway to a new world. As he looked at them, he felt in his heart that he could make pictures too. So he tried to copy faithfully those in the books, and, little boy though he was, he succeeded.

But life could not be all picture-making to a son of the poor hardworking Millet family. Jean-François helped to drive the plow, to sow the seed, and to gather in the harvest. From the fields he could look out over the sea that washes the northern coast of France.

In his free time the boy taught himself to paint. All his family encouraged him, especially the old grandmother, who had always felt that some day this grandchild would be a great man. Sometimes Jean-François would go to the art gallery in the nearby city of Cherbourg to copy the pictures there. In Cherbourg he gained a good friend, who advised him to go to Paris to study art. The Millets were very poor; but the mother and grandmother gathered together all their little savings and gave them to Jean-François so that he might go to Paris to study. He also received some help

From the MAHÂBHÂRATA

BE master of thyself, if thou wilt be
Servant of Duty. Such as thou shalt see
Not self-subduing, do no deeds of good
In youth or age, in household or in wood.
But wise men know that virtue is best bliss,
And all by some one way may reach to this.
It needs not men should pass through orders four
To come to knowledge: doing right is more
Than any learning; therefore sages say
Best and most excellent is Virtue's way.

from the city of Cherbourg through the influence of his friend.

Millet, the true son of Mother Earth and the great open country, never grew to love Paris, the great city of men. All alone he wandered through the picture galleries of the Louvre. Here he found his real teachers. They were the pictures of the old Spanish masters, especially the great master Velásquez. From these he learned much. At first he tried to paint what would please people, but his honest heart soon told him that this was not right. Then he began to paint his dear Mother Earth and the simple peasant people who lived so close to her. As he painted the life

that he knew so well, all those deep thoughts came back to him that had filled his heart, when, as a boy, he tilled the soil and looked out over the sea.

Millet married, and had a happy family of children. One day, he and his wife and all the children arrived at the little village of Barbizon near the Forest of Fontainebleau. Here Millet took up again the peasant life he had lived as a boy. Like his peasant neighbors, he dug, and toiled, and sowed. Between times he painted the life that he lived. He painted one picture of a Sower, sowing a field. As you look at the man, striding over the curving earth, and watch his strong arm as it flings the seed far and wide, it makes you think of all the great and good men and women who have sowed the precious seeds of their thoughts and deeds. You think of Madame Blavatsky, the great Teacher, who sowed the seeds of brotherhood all over the earth. Millet also painted that beloved picture known as *The Angelus*. As you look at the man and woman, standing there with heads bowed in silent gratitude, as the bell of the Angelus rings, you feel all the deep peace that enters their hearts, because their day's work is well done. *The Gleaners* and *The Shepherdess* also show life in the fields painted by one who saw the real spirit of it.

The pictures of Jean-François Millet make people feel how noble it is to work hard and do one's duty faithfully.
STUDENT

Contrary Winds

SAILORS show their best skill, and the real ability of their ships, by using the winds that blow against them. And lives can learn to go forward by the forces which would pull them backward, or upward by the forces which would draw them down. Demosthenes' oratory was the better because he had to overcome the difficulty of a faltering speech. The surpassing marvel of Beethoven's music was in part due to the fact that he had to overcome what would have been to many the insurmountable difficulty of his deafness. When the way is easy there is more danger of loitering than when it is hard. It is the providence and wisdom of God that sends many obstacles. We may look most confidently for our guardian angel in the things which seem adverse. Many wise men have proved their strength, like Samson of old, by carrying off the gates that were locked against them.—*Selected*

TAME GEESE IN THE MEADOW

The Strange Story of Nils and the Goosey-gander

DEAR CHILDREN: If you have read, or have had read to you, the story of the adventures of Nils, I am sure you will not be able to look at the geese in the picture without trying to find among them a white goosey-gander, and imagining yourself sailing off through the air on gooseback to have adventures like those of little Swedish Nils.

Strange to say, this most interesting story was written to be used as a school book; but surely never before was there such a fascinating way of studying the geography and natural history of a country, as by following Nils all over his native land with his mother's tame gander and the flock of wild geese. It was a teacher who wrote it, and her name is Selma Lagerlöf. She must love children very much and understand them very well, to write such a wonderful story book for them.

How Nils got turned into an elf, a tiny creature a few inches high, who could understand bird and animal talk and ride on a goose's back, you must read in the book sometime. I fear Nils is not the only little boy who has deserved to be turned into an elf, and I wish that all those like him might have the chance he had, to learn better ways. Perhaps companionship with birds and squirrels and looking out for wily creatures like Smirre Fox might teach others to be kind and merciful, if they have not yet learned. But this does not apply to Râja Yogas, of course, who love all the things that live and never injure any of them.

Imagine riding along through the air, looking down on the earth and seeing so much of it at a time that the bare fields, the grassy places, and the forests, look like differently colored squares in a checked cloth. Hither and thither Nils rode, as the flock of geese

went all over Sweden, visiting their old haunts and finding good feeding-places. It was a delightful way of traveling, when one had been turned into an elf and could sit comfortably on gooseback and nestle cosily under a wing on cold nights. It was lucky for Nils that he had done so much to mend his ways and win the love and respect of the great Akka, leader of the flock of wild geese, so that she decided to take him along. How very happy Nils must have been too, when he learned the joy of helping the animals in a friendly way, instead of teasing them. There is the pretty story of the way he brought the baby squirrels to their poor mother, who had been caught and caged, and thus won the friendship of the animals and birds in the woods. The bullfinch sang a song in honor of him, telling him that henceforth his friends in the wood would always supply him with nuts for food, would send him warning if danger were near, and quick runners to carry him far from it.

You will see how friendly all the animals became towards Nils when you hear that he was permitted to go to their great play-meeting, held every spring at Kullaberg. He rode there on the stork's back. That was a ride! The stork flew round in circles, then struck downward suddenly, and did many other tricks. Nils, however, was accustomed to flying by this time, and only enjoyed it all. At Kullaberg, the birds and animals were all arranged in their proper places — foxes on one little rise of ground, stags on another, hares here, grouse there, birds and animals of all kinds in groups, in nice order. You have all been to see sports, but never such sports as these at Kullaberg. Can you imagine a hares' race, a crows' flying dance (I should have put this first as the program always opens with the crows), musical contests for grouse, wrestling matches for the stags, and

last of all the magical stork dance, which closed the exercises? No one transgressed the rule of the day, which was that no animal should harm another — except Smirre Fox, and he was outlawed there and then.

Though Nils, or Thumbietot, as he was always called while he was an elf, could understand bird and animal talk, he did not forget human speech; and many, many a lesson did he have, and many, many a story and legend did he hear, as he waited for the geese while they ate or slept. And what pleasant experiences he had learning about the friendship of the animals and birds. There is a great deal going on in the world, which boys and girls have not learned to see and hear. It was this that Nils learned besides many facts about the country and its history. When one is an elf and rides a goosey-gander, one can get to places and see things in a very different way from the usual one, and learn much more. All this is put down in the book.

But when, one day, Thumbietot looked down and saw that the geese were flying over the very place where he used to live, he suddenly wished to see his home. Akka, the old leader of the flock, came to him and asked him if he would not like to visit it; so down he went on the goosey-gander's back. Mayrose, the cow in the barn recognized him and was glad to see him. She told him that his father and mother did not know that he had learned to do so much better; and then the little elf did wish to be a boy again, and show his parents, as he had the birds and animals, that he knew better now. The goosey-gander was glad to be at home too. His mistress recognized him. When Thumbietot spoke to his mother he found that he was once more a boy. He bade good-by to the geese, but I do not believe he has ever forgotten the lessons he learned while he shared their flight.

High Intelligence of Primitive Man Science a Convert to Theosophical Teachings

ONCE more attention is called to the increasing frequency with which views that Theosophists have fought for during years against a weight of contrary opinion, are now boldly and openly expressed by the representatives of current thought. In H. P. Blavatsky's works it is contended that the accepted scientific notion about the descent of man is contrary to both reason and fact; and many articles in support of that point, illustrated by quotations from *The Secret Doctrine*, have appeared in the CENTURY PATH. Now we find, in *Records of the Past*, a long article on "The High Intellectual Character of Primeval Man," contending for the same point. The following is a brief abstract of it.

Comparative anatomy can tell us but little; it merely deals with the lower part of man.

The mental and moral faculties have to be examined, and from these we conclude that man has a spiritual nature and had a spiritual origin.

We are told that the revelations of science have changed this and proved that man is only an improved ape, and that his distant ancestors were purely bestial. From this state he slowly raised himself by a long struggle with nature. The savages now on earth, it is said, represent a comparatively early stage in this ascent, and are devoid of the high qualities of civilized man.

But why are we to suppose that the present savages represent the earliest men? If they do, why have they not raised themselves? Why have they fallen behind? By hypothesis, they have lived longest on earth, and therefore they ought to be more advanced instead of stationary.

Two great facts show that these savages are as truly men as their more civilized brethren: first, they have the power of improvement; second, it is certain that degradation has for a long time affected them.

The Australians are so intellectual that in Queensland they have been taught to become excellent police; they have been taught to play chess, and the children learn quickly in English schools. Their rock paintings show real artistic powers.

The Bushmen of South Africa are fond of music and singing, and very skilful in painting and drawing.

The Fuegians are thought to be the lowest representatives of humanity; but what are the real facts? They have been reclaimed, taught

to read and write, and instructed in the arts of civilization. Darwin himself admitted that the progress of Fuegia was the most wonderful thing he had ever heard of.

The Esquimaux have been taught to manage English sailing vessels and to play musical instruments so as to develop correct tunes, reading note-music at sight.

The Mincopies, the "black" dwarfs of the Andaman Islands, are now proved to have been slandered; de Quatrefages has collected a mass of information leading him to the conclusion that their mental and moral characteristics are of a superior order.

Most modern savages show unmistakably that their ancestors were once in a far higher state of development. One sign of this is language. Mr. Horatio Hale, in a paper before the Royal Society of Canada, maintained, from the complex nature of their language, that the Australian aborigines originated in the cultured races of the Dravidians of India [?]; and the languages of many of the American aborigines prove their descent from cultured ancestors. Mr. Hale summed up as follows:

The result of our inquiries—a result deduced alike from the evidence of language and that of history—is that a state of barbarism does not imply any inferiority in intellectual power. It simply indicates that the barbarous people have been compelled to live amid surroundings which rendered any advance in culture impossible. . . .

This naturally leads us to consider some of the theories which have lately been put forth in regard to the condition and character of primitive man. Strange to say, the modern representatives of this unknown individual have been looked for in places where, by the common consent of all physiologists, he could not possibly have come into being—in Australia, in South Africa, in the Pacific Islands, and in America. Many works have been put forth in which speculations . . . have represented the earliest men as sunk in the lowest debasement of mind and morals. . . . But . . . all these peculiar usages of barbarous tribes are simply the efforts of men pressed down by hard conditions below their natural stage, to keep themselves from sinking lower, and to preserve as far as possible the higher level of intellectual, moral, and social life to which their innate faculties tended to exalt them. . . .

A child who should assume that the primitive canary could only flutter for the distance of a few yards, would be as wise in its inference as the philosopher who regards the Australians and the Fuegians as representatives of primitive man.

Dr. A. R. Wallace comes to a similar conclusion. In a recent paper in the *Fortnightly Review* he maintains that the progress of modern civilization does not prove the mental superiority of the men of the present day

Modern Civilization No Proof of Mental Superiority

over the men of the earliest ages. He says: Our intellectual and moral nature has not advanced in any perceptible degree. . . . [Savages,] when sympathetically studied, are found to resemble ourselves in their inherent intellectual powers, [which is proved by their] complex language, their elaborate social regulations, and often by an innate nobility of character.

And he says that this shows the necessity of *moral evolution*, and development of *character*, which is the true human nature, as opposed to mere materialistic knowledge.

It is in this moral nature, too, that is found the secret of that degeneration which, coupled with adverse physical conditions, has brought so many races into their present state of degeneration. We see *individuals* thus sink from culture, by yielding to their baser instincts and ignoring the voice of conscience. And so it is with the *race*. It perishes in the "struggle for existence," because it has thus weakened itself. The late Duke of Argyll enumerated three causes of race degeneration: Yielding to animal passions; internecine conflict; and adverse conditions. Hugh Miller asks:

Man Responsible For His Own Degeneration

If man, in at least the more degraded varieties of the race, be so palpably *not* what the Creator originally made him, by whom, then, was he made the poor lost creature which in these races we find him to be? He was made what he is, I reply, by man himself; and this, in many instances, by a process which we may see every day taking place among ourselves. Man . . . is free either to resign himself to the indulgence and self-indulgence so natural to the species; or "spurning delights, to live laborious days," etc.

The rude stone weapons found in old strata do not prove the degraded nature of their users, because the same weapons, and even worse ones, are used today by those very races whose innate capacity has just been vindicated. Again, the alleged migrations of Palaeolithic men—to and from Britain, for instance, before and after the Ice Age—implies a great deal of intelligence and ability in them; while the fact that they should have migrated at all, from the warm shores of the Mediterranean to an inhospitable climate, shows that there were more civilized races which compelled them to do so.

Past Conquests Imply Past Intelligence

A further evidence of the high intelligence of primeval man is found in the manner in which he maintained himself against the swarms of monstrous and ferocious beasts by which he was surrounded. Not only did he hold his own against them, but even, so we are told, he actually exterminated many of them. We must remember also that man achieved this astounding victory over these mighty animals by means of *stone* weapons, which were of the *rudest* possible character. His triumph, therefore, was solely due to his wonderful intelligence.

So much for the summary of the article in *Records of the Past*. The writer elaborates his last point considerably; but one is reminded of the following remarks in *The Secret Doctrine*. After describing the huge animals with which geologists say man was contemporary, H. P. Blavatsky continues:

All these were co-existent with man, most probably attacked man, as man attacked them; and we are asked to believe that the said man was no larger than he is now! Is it possible to conceive that, surrounded in Nature with such monstrous crea-

tures, man, unless himself a colossal giant, could have survived, while all his foes have perished? Is it with his stone hatchet that he had the best of a Sivatherium or a gigantic flying saurian?—(Vol. II, p. 219)

The Secret Doctrine

Palaeolithic man must have been endowed in his day with thrice Herculean force and magic invulnerability, or else the lion was as weak as a lamb at that period, for both to share the same dwelling.—(*Ibid.*, p. 722)

There is very much more evidence given in *The Secret Doctrine* than the writer of the article has adduced, and that book was published 21 years ago. H. P. Blavatsky also declared that the present century would witness the admission of many of her contentions by that very science which was so deriding them while she wrote. And have we not here a fulfilment of that prophecy? In a prominent archaeological magazine the views of science are assailed on the very grounds which H. P. Blavatsky took. It is shown that modern savages are not primitive man but survivals, and that scientific men have coolly garbled the evidence in order to support a pet theory. The doctrine of "survival of the fittest" is given a moral meaning: the "fittest" being no longer the one with the biggest stone axe or the biggest bump of destructiveness, but the one with the Magician's Wand of Knowledge and Will. As for the unfavorable physical conditions, one would assign them as an effect rather than a cause; it was the lapse from duty that brought about those conditions or at least caused them to prevail against the man.

Nature Enforces Moral Fitness

But what does all this lead to? Where shall we arrive if we follow up the clue and trace these admissions to their logical conclusion? We shall have to admit that high culture and civilization are of great antiquity upon earth, and this will upset all current notions founded on the contrary idea and will lead to an admission of the postulates of the Secret Doctrine. Where did man get his culture, his lofty moral motives? It all means that man is first and foremost a product of Spiritual evolution. To be clearer, one should say Spiritual *involution*; for the law is that Spirit descends into Matter, becoming itself thereby obscured, but elevating Matter. Should we not therefore look for the Spiritual ancestry of mankind, rather than for his physical ancestry? And since the testimony of antiquity is being quoted, we may as well remember that antiquity is unanimous in claiming descent from "Gods" and "Heroes." It is one of the teachings of the Secret Doctrine that such races of Divine Men have existed. The Dzayan Commentaries say:

Man's Spiritual Ancestry

Then man appealed to the superior Fathers. The Nirmānakāya of the Nāgas, the wise Serpents and Dragons of Light came, and the precursors of the Enlightened. Divine Kings descended and taught men sciences and arts, for man could live no longer in the first land.

Then the point about degeneration being due to moral lapses should not be missed. It means that any one individual *may* degenerate (through successive incarnations) towards a semblance of the alleged pithecoïd ancestor. And it means that he may *rise*—rise to undreamed-of heights, by the opposite process of being true to his own best. TRAVERS

Modernizing Rome

OUR duties with respect to the past are twofold: first to profit by what is useful in it; second to cast off our ties with what is harmful. Archaeological relics may be piously preserved as reminders of the ancestral prowess which we must emulate, and as witnesses against those narrow-minded views of human history by which so many false views of life are buttressed. The other side of the question relates to our duty in clearing away relics that may help to bind us to mouldy traditions and prevent expansion and progress. Sometimes there is a conflict between these two duties and a difficulty in judging which is the greater. The question whether to submerge the lower part of the temples on Philae in order that Egypt might be irrigated from the Nile barrages was of this kind, and was settled in favor of the more urgent practical need. Another such question arises in connexion with what follows.

Rome is agitated about the modernization of the whole city. Many think that the zeal of the renovators is carrying them too far, and that their plans are being hustled through by an unsympathetic municipal authority. It is purposed to pull down a great many houses in the very heart of the city. In some of the sites where it is purposed to build new suburbs, catacombs exist; and these, it is said, must either disappear or, by a caving-in, cause the suburbs to disappear. It is purposed to cut the historic passage uniting the Vatican with the Castle of St. Angelo; to drive a tunnel from the Piazza di Spagna to the Villa Borghese beneath the Villa Medici, involving probably the sacrifice of part of the Medici Garden; to destroy the Church of the Crociferi or Crutched Friars; and to modernize the Via dei Coronari.

One sympathizes with the reverent Romans to the extent of being able to understand the pain of severing old ties and leaving old haunts. Yet the pain of partings is an affliction which everyone may be called upon to endure in the interests of some greater duty or necessity. No doubt there are in Rome many old relics of the kind that could be spared; and, when one reflects on certain mouldering institutions in the realm of thought, of which Rome is the visible symbol, one can not but feel a thrill of joy at the thought that the modern progressive spirit is cleaving its way through the old stones, cutting passages, driving tunnels, turning catacombs into mains for water and electricity, and otherwise disturbing the bats and specters.

And for one who believes in the intimate connexion between event and symbol, between symbol and event, the significance is even greater. Open up, let in the light, good Romans; naught that is healthful fears the day; and may the catacombs of our minds, where lie the corpses of dead ideas, be cleared out. E.

Aerology

SYSTEMATIC observations of the upper air by kites or balloons are now made at Trappes, France; Uccle, Belgium; Utrecht, Holland; Brighton, and Manchester, England; Pavia Italy; Guadalajara, Spain; Zurich, Switzerland; Strassburg, etc., etc., Germany; Vienna, Austria; Tiflis, Baku, etc., Russia; Helwan, Egypt; Blue Hill, Mass., Mount Weather, Va., U. S. A.—on "international days." J.

Some Views on XXth Century Problems

The Workings of Law

IN some of his recently published letters Beethoven shows us what he felt as he found that deafness was steadily creeping in upon him. He, who lived in hearing, was now to hear no more! The malignity of fate seemed to have no further possibility.

But was it malignity? Or was the outer sense closed only that the inner might hear and record the more perfectly? Those who can listen with full understanding to the works he composed after the supervention of total deafness know that he was trying to express inspirations that were beyond the capacities of any instrument or combination of instruments. The listening must be beyond and through and around the rendering to get the full meaning. We cannot imagine the intensity of his own feeling during the act of composition. Even Handel said that in composing the *Hallelujah Chorus* it seemed to him that "all Heaven was opened" to him.

That, we may say, was Beethoven's compensation. Doubtless at the very end of his life, after the end as we should count it, he saw that the compensation was more than complete.

But that view, after all, is a little superficial. One way of conceiving the soul, at least in part, is to think of these great creators. For the soul, the immortal, is that which does the creating. Outside the soul is the personal layer living the life that all of us live, only so much of this being immortal as connects itself with the soul, as thinks thoughts and does acts and develops feelings that can correspond with the divinity within it.

So the deafness was the soul's opportunity, a step to its freedom to feel and create and express. It could press in nearer to its own place and catch harmonies not possible for it while the outer hearing was subject to the million appeals of the world.

The man passed on, the richer for his deafness; and we too the richer for his fuller message. For the greater souls are conscious of a message to the rest. That which passed on, returns, reincarnates, clothes itself anew in the vesture and apparatus and consciousness of the common life. Once more the musician, now visibly blest by that which when it came seemed a malign curse.

Suppose that when the deafness came he had fallen into utter despondency, thinking that the whole possibilities of life were closed, refusing to press them and thus find them greater than ever they were before. He might have done that; it is only what men too often do in like case. But he was strong and stayed on the field of action.

His case was no exception; the Law which showed itself so beneficent in its ultimate work for him, is just as beneficent for the rest of us. It is not blind, not purposeless. It is at work for the soul of every other man as it was at work for his. Whatever happens, we need only to trust, and then push. We shall find some door yielding and from that may know what the Law, Karma, was about. It is the servant of souls, not of outer personalities. To the latter, if they will not trust it, it may seem

hard enough. There is a creative soul in each of us, and the Law is trying to free it for its work. In the case of the genius, it has begun to succeed.

We know as yet of only a few kinds of genius, perhaps a dozen. But as we evolve into closer touch with nature, with forces of which as yet we know nothing, there will be a thousand others. And as the poet makes better poetry for the music of the musician, and the latter better music for the poetry of the poet, so all men, when their souls are awake, will give — each of his special light — to all the rest. That is what brotherhood finally comes to. Men are separate and they are one; the separateness ultimately enriches the unity, and the unity shows its wealth in the separateness. But each of us can only come to his fuller self by developing his unity with the rest and by determining to deliver to and for them what is in him to deliver. And the Law will help him; that is its work.

STUDENT

Starved Ideals

"YOUTH, the time of ideals," says the pessimist of later life, "disillusioned" as he puts it, and never staying to ask himself why he has his ideals no longer. They need spiritual vitality for their maintenance and for the fruition in conduct, character, thought; or perhaps in poetry or art.

"Burning the candle at both ends," is a figure that needs care in its use. Sensuality and ideality can live together in the same person for a time. But the former is a consuming flame; the latter is another sort, one that renews and purifies. When sensuality has consumed the superfluous vital cash, so to speak, of youth, it begins to draw upon spiritual reserves. And then the ideals must grow pale and die.

We think a great deal of our systems of education. But in truth we do not educate at all in the deeper sense. We teach the child nothing whatever of the secrets of its own life. And thus for one poet and thinker who succeeds as such in breaking through into stable manhood, a dozen as such fail. There is the manhood, but unensouled by poethood, thinkerhood. There is foliage but no flower. The vital essence that would be needed for efflorescence in genius is gone in gluttony, sensuality of many kinds or every kind; been frittered away in nothings, unnoticed, unknown of, untaught of. The child's and youth's attention has never been called to the divine flame within. Its light is the ideals of youth, but their spiritual physiology, and the relations of their physiology to animal life, are never explained.

Genius is natural. But now, only its intensest degrees can survive the years of our uneducating education, and then but faint to what they might be. For a hundred generations we have considered genius as abnormal, inexplicable, mysteriously sporadic, not to be prepared for or expected, out of all relation to ordinary vitality. It is only all this because we have made it so, and it will take time, the

demonstrations of Theosophy, and new belief, to alter it.

We should expect genius as we expect health, and adopt and enforce a regimen for the one as we do for the other. Genius is the working of the soul into ordinary consciousness and Katherine Tingley's "Râja Yoga" is the safeguarding of the latter. Ordinary education does not safeguard it, merely fills it with facts, and disciplines it mechanically, unhelpfully, unexpectedly. STUDENT

Indices of Civilization

THE word civilization, standing alone, means such diverse things in diverse mouths that it may be said to have no meaning at all. With one man it may mean the progress of human consciousness towards higher and nobler being. With another it may mean the progress of human consciousness towards more cash. The latter is the more usual meaning. *The Literary Digest* for example has just remarked, under heading "Inventions and Civilization": "That our age is the age of invention is another way of saying that civilization is advancing." Similarly *Umschau* says:

The demand for patents may be taken as giving the measure of a nation's advancement; the more patents demanded from a government, the greater the civilization of the country concerned.

A nation of acute fiends might surpass us all in the number of patents it registered over the signature of its presidential devil, and would be correspondingly more civilized. The philosophy that appears to be most rapidly growing in popularity is that of Nietzsche, and it is one precisely competent in practice to produce that kind of nation.

To our thinking the index of civilization is the ratio between the altruistic and the purely self-seeking as motors of conduct. Civilized men are men whose sole aim is to contribute something from hour to hour to human welfare. To that end they invent, compose, paint, think, culture their bodies to perfect health, weed, harrow, study and write. The unjarred peace of mind that comes of such a life generates finer senses, larger perceptions, and clear and easy knowledge concerning those problems upon which other men must fretfully and fruitlessly speculate.

There are such men, a few, harbingers and seed-holders of a real civilization which will be that of the Golden Age again and much more. STUDENT

Health in Age

PROFESSOR WILEY, the respected Chief of the U. S. Bureau of Chemistry, has been asked by a contemporary to summarize his views on the attainment of a happy and healthy old age. A summary of his summarization would be: *Eat less*. When a man has done growing he naturally needs less food than whilst growing. In defiance of what is believed to be appetite, food should therefore be much diminished. "I should say that an average man of sixty does not need much more than half as much food as he did at twenty-five, or even at twenty." STUDENT

An Astronomer on Stonehenge

IN conjecturing the origin and use of Stonehenge and other circles and alignments, Sir Norman Lockyer goes further than many theorists, but even he goes but a small way. He has recognized one of their uses, at all events, — that of establishing on the earth fixed directions so that the relative movements between the earth on the one hand and the celestial sphere and moving orbs on the other might be observed and recorded. And by this he has calculated a date for the stone monuments in Britain, which he sets at from 1400 to 2200 B. C. But so far his idea seems to be that the work was undertaken by untaught people, ignorant of the length of the year, who thus sought to supply their lack of calendars and other chronological facilities. Thus his conjectures are still haunted by the prehistoric barbarian fetish. To people, however, whose conjectures are not fettered by such a limitation, it will seem strange that a people so uncultured as to lack the simpler means should have resorted to the less simple; especially in view of the fact that barbarians, as known to history and to the present day, do not usually construct vast buildings the like of which has not been equalled by civilized races. And again, if we are to consider the erection of such structures as a preliminary and tentative stage in the acquisition of astronomical and chronological knowledge, then surely we must either have gone through that stage ourselves or have borrowed our knowledge from people who have.

The fact is, as will later on be more generally admitted, that there are far more important chronological data than the length of the year to be recorded by these buildings; and indeed one of these data is actually suggested in the fact that Sir Norman has been able to assign a date of construction. This also gives the reason why the structures were so massive, when, for the purpose he alleges, a much slighter erection would have sufficed. They were intended to last through the ages and form a record of *greater* astronomical cycles such as are not completed save in many centuries. A knowledge of these larger cycles not only afforded a key by which the mechanism of the heavens could be reduced to an orderly mathematical science, but, through the law of correspondences between things natural and things spiritual, it constituted one of the most important keys of that ancient science which comprised the whole domain of knowledge, both of Nature and of Man.

Sir Norman thinks the Egyptians must have gotten the idea of their temples from these reputed barbarians, and sees in those temples but the same astronomical purpose fulfilled with greater elaboration but not greater efficiency.

Any one who has read *The Secret Doctrine* by H. P. Blavatsky will see that the data to

Lomaland Photo. and Engraving Dept.

A JAPANESE TEMPLE

be taken into account in speculations like these are much more numerous and varied; and that, until we take a more comprehensive view of universal history, our conclusions can only be tentative and incomplete, besides varying with each particular theorist and his particular field.

Darwin on the Evolution of Man

FOR those who want to know what Darwin did say, the following, from the end of *The Descent of Man*, may be of service.

The main conclusion arrived at in this work, namely, that man is descended from some lowly organized form, will, I regret to think, be highly distasteful to many. But there can hardly be a doubt that we are descended from barbarians.

Such a statement is neither true nor false, but only misleading. Barbarians have contributed a strain of blood to the formation of new stocks. Barbarians can never ascend into anything higher without the influx of some inspiring Spiritual power. Barbarians have themselves descended from civilized races. In short, barbarians are by-products, though they may also be raw materials. Darwin continues:

The astonishment which I felt on first seeing a party of Fuegians on a wild and broken shore will never be forgotten by me, for the reflection at once rushed into my mind—such were our ancestors. These men were absolutely naked and daubed with paint, their long hair was tangled, their mouths frothed with excitement, and their expression was wild, startled, and distrustful. They possessed hard-

ly any arts, and, like wild animals, lived on what they could catch; they had no government, and were merciless to every one not of their own small tribe.

He adds that he would rather be descended from a monkey than from such men, hinting at the ape idea in the following words:

He who has seen a savage in his native land will not feel much shame if forced to acknowledge that the blood of some more humble creature flows in his veins.

The following is also curious:

Man may be excused for feeling some pride at having risen, though not through his own exertions, to the very summit of the organic scale; and the very fact of his having thus risen, instead of having been aboriginally placed there, may give him hope for a still higher destiny in the distant future.

What is implied by the phrase, "though not through his own exertions"—especially in connexion with the hope of future development? Does he mean that present man rose through the exertions of past man, and that future man will rise through the exertions of present man? At all events there is implied the existence and working of some independent power, in man or outside of him. Darwin does not deny this; in fact he says:

We are not here concerned with hopes or fears, only with the truth as far as our reason permits us to discover it; and I have given the evidence to best of my ability.

The study of the Divinity in man did not enter into his province.

He concludes by remarking that man, in his debasing passions, still bears the indelible stamp of his lowly origin. Yes, man certainly derives some of his elements from the animal kingdom; but he derives some from the vegetable kingdom and some from the mineral. And there are other kingdoms from which he derives part of his nature; does he not equally bear the indelible stamp of his Divine origin? T.

Dinosaur 3,000,000 Years Old

IT is announced that in Wyoming a dinosaur has been found whose very skin is preserved, and that the Museum of Natural History has acquired it. The animal must have been mummified by the sun and sand and then buried before the skin could decay. According to a moderate estimate of geologic time, this was 3,000,000 years ago. Geology is generous of time, compared with other branches of science. Anthropologists are comparatively very stingy, and historians worse. To allow that a skin has been preserved for thirty hundred millenniums is to allow a great deal surely. If this can be so, why make such a fuss about admitting other possibilities not nearly so wonderful? Why cannot man have lived and flourished—say, to be modest, one million years ago? E.

✻ The Trend of Twentieth Century Science ✻

Subjective Evolution

BIOLOGISTS do not ordinarily consider intelligence as one of the *factors* in nature; it is as much as their imaginations can do, as a rule, to consider it as one of her products. Even so, they place its appearance as far up the scale as they possibly can. But it will ultimately have to be taken not only as both factor and product but as having a corresponding *double* evolution. When we consider the intelligence of, for example, the Kallima butterfly, we consider it as a product. *But the intelligence which modified that insect* so as to bring it to a perfect resemblance to a dead leaf, though perhaps *in* is not of the insect; *this* is intelligence as factor. It works through and in the germ plasm and though the source of the intelligence whereby the insect guides its own daily life, is much greater than that. At the death of the insect the latter doubtless merges into the former, not having yet separated out its consciousness as a unit from the larger consciousness.

Change of form in response to environment, even so radical as to constitute a new species, is not necessarily evolution. The whiteness of a bear's coat, to correspond with snow, is not in itself an advance in evolution upon the brownness of the original coat. That which evolved in the change was the underlying factor-intelligence, advancing as everything else advances—through exercise. Underlying *formal* evolution is the evolution of the guiding intelligence in speed, delicacy and complexity of work. If the theologians had not insisted that nature was under the minutal and immediate guidance of God, there would never have been the reaction that made her blind, mechanical, and unconscious. She would have been allowed consciousness and intelligence; her *mistakes* would have been an evidence both of intelligence and of its evolution.

STUDENT

Variation Purposeful and Purposeless

SOME modern biologists are already proposing to classify variations into two groups: those that—as *all* are usually supposed to be—are accidental and in every direction; and those that are in a definite direction and as it were mean business. The latter have a fixed nature-purpose behind them, either to bring the species into closer relation with its environment, or to carry it evolutionarily higher. These latter will tend to be permanent, and to be accentuated through successive generations. The former will not be naturally permanent, may not appear any more, and can only be artificially fixed with extreme difficulty or not at all.

Dr. Raymond Pearl, of the University of Maine, has just given us an example of the latter case and attempt. He tried for nine years to evolve high egg-production in a strain of fowl, but without any success. Selecting some accidentally two hundred-egg hens, he found that their daughters did not even give so high an average of eggs as those of hens whose production was less than two hundred. Continuing to select accidental two hundred-egg appearances in successive generations, he

found that the tendency towards the two-hundred standard grew no stronger for the continuous selection.

In other words this was an accidental and not a purposive variation, and it *could* not therefore be made permanent. There was no soul in it.

STUDENT

Solid Tides

FLAMMARION'S discovery or assertion that there is a daily double tide or undulation in the earth's crust comparable to the oceanic tides and having the same cause, does not seem to have been everywhere received in an entirely friendly spirit. "*That's nothing; we can do better than that!*" comes from South Africa. Kenilworth Observatory, it appears, makes a specialty of crustal movements and comments thus:

There is a daily tide over the whole crust, not two of them. It is much more intensive than Flammarion's eight inches. It is not due to the moon, but may be due to the sun. And it occupies the entire twenty-four hours in its cycle.

In addition to this daily tide there is, at any rate so far as concerns South Africa, an annual one, tilting the subcontinent to the east in summer and to the west in winter.

But South Africa must not become vain over her annual tide. Without doubt it belongs, like the daily one, to the whole crust. And it seems exceedingly likely than in addition to the main daily one, Flammarion was right in asserting a small bi-diurnal one corresponding to those of the waters. A geology book of a hundred years hence would be very perplexing reading if it should happen to drop back into our own day. It might even read more like physiology than geology.

STUDENT

The Next Plane for Chemistry

MODERN chemistry makes it probable that the elements we now find on earth have had two periods of generation. The most recent researches trace back the lighter ones to the heavier, suggesting that the former are degeneration products of the latter: helium, for example, of radium; radium of uranium; lithium, perhaps, of copper; carbon, perhaps again, of thorium. The last terms of the degeneration, chemistry now supposes to be hydrogen—this was taught by H. P. Blavatsky many years ago in her *Secret Doctrine*—and electrons. In a recent address, Sir William Ramsay gave his support to the theory of Egerton, "that the atoms of the other elements are composed of some number of atoms of hydrogen plus or minus some number of groups of electrons."

As, in pre-geological time, these integration processes produced the elements, finally ending with the heaviest: and as, in our own time, we find these heaviest giving birth by disintegration to the lighter ones, it would follow that there may be two periods during which the elements now on earth were formed. There was a time in the integration process when carbon for example was produced. Further integrations of some of this mass of carbon resulted in, let us say, thorium. Is the

bulk of the carbon now on earth that much of the mass which did *not* go on to thorium, persisting since that period? Or did it all go on, so that that which we now find has come into being by the undoing of thorium?

The questions are of course very crudely put and merely by way of example of the principle at issue. There can be little doubt of the answer that must be given. The mass of the elements we have, date from the formative period. And from that it would follow that we must have in our midst, so far too subtle to detect, products of formative periods antecedent to those which produced the subtlest matters known and studied by modern chemistry. They exist in the human make-up, and, says Theosophy, compose those subtler vehicles of consciousness that lie within the physical one. Science has yet to enter upon the chemistry of the astral body—*post mortem*, the spook—to say nothing of yet finer vestures.

STUDENT

An Electric Gun

IF we could only learn how to shoot electricity from some sort of gun, thinks M. Gustave Le Bon, we could bring war to an end.

Conscience seems to be subtly at work in this sort of speculation. The scientist who sights a new principle in physics or subjugates force in some new way, hypnotized by the spirit of the time immediately considers in what way his principle or force can be utilized in war. This makes him interiorly uneasy; but he allays his uneasiness by the consideration that his new and still deadlier weapon will by its very deadliness bring about the cessation of wars.

Hertzian waves are ether waves generated by the passage of an electric spark. They radiate in all directions from the spark somewhat as ripples radiate over a sheet of water from a stone thrown into it. It is these that constitute the transmitting agents in wireless telegraphy. M. Le Bon finds that they will pass through three feet of stone but that they are stopped by the thinnest of sheets of tin. The aperture made by the point of a needle is however sufficient for their passage through the sheet.

Considering these facts, M. Le Bon thinks we may somehow sometime succeed in getting parallel Hertzian waves from spherically radiating ones.

Meeting an obstacle, such as a ship or a powder magazine, these electric radiations would "charge" the whole metallic portion of the object thus met with. The metallic framework would splutter with the electric sparks discharged. The network of metallic wires on ships, torpedo boats, etc., would provoke an atmosphere of sparks which would cause the magazine or the shells to explode.

I am convinced that this is not mere fancy. Our grandchildren will see its realization.

But he does not reflect that by the time "our grandchildren" will have ceased to use magazines and shells which can be exploded by sparks. Every new invention in destructives carries with it its own reply. War will only end by the development of its antagonistic spirit, friendliness.

Studies

The Senses of Insects

A STUDY of Theosophy will help every investigator, whatever his chosen field, because it will familiarize him with certain general principles of universal application; it is, in fact, a master-key; or, again, it may be compared to the ascending of an eminence wherefrom we can survey the country outstretched below and trace its deviating paths for a long distance.

In studying the question of the senses of insects, science finds considerable difficulty, owing to its custom of reasoning from familiar human analogies; and this method, in the case of a kingdom so far removed from man as the insect kingdom, is not very reliable. For example, it is considered necessary to search in insects for the same five senses so familiar in the higher kingdoms; yet, so different is insect structure, that it would seem more reasonable to expect an equally great difference in the equipment of senses. But now consider the Theosophical teachings with regard to the senses. They are all modifications or subdivisions of one sense; a fact which science has recognized so far as to speak of a single tactile sense and to describe the other senses as local and functional variations thereof. Further, sensory perception is an offshoot of another and more refined kind of perception, which may be called "mental perception"; or, in other words, the senses proceed from and are developed by the mind. Within every conscious being there is the "Knower." In its essence the Knower is the perceptive aspect of the Universal Mind, Divine Intelligence; but it is manifested in Nature in various grades. In Man its highest function is Spiritual Intelligence; and in his mind it takes various forms, ranging from the most refined aesthetic appreciations down to the coarsest animal tastes. For purposes of physical life, the inner organism of Man develops physical senses, which co-ordinate the mind with physical Nature, but at the same time limit and restrict the functions of the mind. These senses are, in general, five, but by no means limited to that number. In animals we find evidence of the possession of senses which tell them where their home is situated, when bad weather is coming, etc. In man, we find occasional instances, now becoming more frequent, of the possession of unusual senses.

The sense of hearing in insects is considered in an article in the *Scientific American Supple-*

ment, taken from *Prometheus*. Insects do not possess ears at all like those of mammals, but organs are found which are perhaps used for hearing. Insects which make noises usually have such organs well developed: the antennae of crickets and grasshoppers are an instance. The antennae of insects are apparently used chiefly as organs of smell; but the microscope has revealed in them sense-organs of various forms. Hence it is concluded that they serve simultaneously as organs of smell, hearing and touch. One observer found inside the bodies of insects a kind of stretched strings which seem constructed for hearing, though they are so deeply imbedded in the body that it is not easy to see how sound-waves could reach them. As far as observation tells us anything about the responsiveness of insects to sounds, we may conclude that they are deaf to many sounds which we hear, and perceptive of many sounds outside the range of our hearing.

However the case may stand in regard to what is ordinarily defined as "hearing," the obvious fact is that every creature has the power of perceiving that which it needs to perceive. But, when we get down to a definition of the exact meaning of specific senses, we find that the character of the external organ is really far less important than the character of the mind which uses it. And what can we possibly tell about the nature of an insect's

mind? This mind, whatever it may be, receives telegraphic messages from various parts of the body, and interprets them — who can say how? Is not the impression of the external world which we obtain from our senses an idea, dependent on education, reflection, and sundry other factors? And what sort of a picture does the insect form in its mind as a result of the impressions it receives? STUDENT

Scientific Ice

HYDROGEN monoxide is a colorless substance, occurring in hexagonal crystals which liquefy at 0°C . Owing to the ordinary temperatures of this earth being above 0°C ., the monoxide is usually found in its liquid form and is popularly known as "water." It is used for drinking, washing, and many other purposes. As large deposits of this mineral exist in all parts of the earth, it occurs abundantly in cold countries in its solid form, the crystals coagulating together into a glassy mass which is called by the common people "ice."

The crystals of hydrogen monoxide are hexagonal prisms and exhibit double refraction in every direction but that of the principal axis, as also interference figures and colored bands with the Nicol prisms. When solidification takes place directly from the vaporous condition, the most gorgeous and varied hexagonal crystals are formed. E.

From PERSONAL TALK

“YET life,” you say, “is life; we have seen and see,

And with a living pleasure we describe;
And fits of sprightly malice do but bribe
The languid mind into activity.
Sound sense, and love itself, and mirth and glee
Are fostered by the comment and the gibe.”
Even be it so; yet still among your tribe,
Our daily world's true worldlings, rank not me!
Children are blest, and powerful; their world lies
More justly balanced; partly at their feet,
And part far from them; sweetest melodies
Are those that are by distance made more sweet;
Whose mind is but the mind of his own eyes,
He is a slave; the meanest we can meet!

William Wordsworth

Some Defects of Modern Education

He who knows not and knows not that he knows not,
is simple: teach him.
He who knows not and knows that he knows not,
is a fool: shun him.
He who knows and knows not that he knows, is
asleep: wake him.
He who knows and knows that he knows, is wise:
follow him.

THE old Persian proverb has never been more aptly illustrated than in those magnificent schools of learning that were the glory of ancient Greece when at the zenith of her greatness. The splendid mental wealth of the great teachers of those days, teachers whose names will ever be associated with the finest systems of imparting knowledge the world, as known, to history, has ever seen, did not stand alone, but was coupled with a physical and moral poise that is rarely seen today, and it these combined that are the true factors, the keynote of success in the art of teaching. The ancient teachers knew, and knowing that they knew, they were able to infuse into their students that absolute confidence which enabled them to rise to heights of intellectual attainment and rounded-out character that is reached in these days only by the very few.

No one who has given attention to the question of education as now carried on can fail to notice that in spite of all of the achievements of the day, there remains much to be desired. The truly marvelous monuments reared in the cause of education, of minds crammed with a mass of facts and detail, raise the question whether after all such a system, when not balanced by the poise that comes from the true study of life, is not calculated to turn a man into a mere intellectual machine, valuable indeed, in so far as his mental capacity is enlarged and made retentive, but lacking the power of the heart-life which is absolutely necessary to make his influence of permanent good to the world. The man of the world, with short time and no great inclination to investigate, is asking whether the ex-

tensive curriculum of today does not result in a mass of mental pabulum of problematical value in after life through having been badly digested. How many who have had a good education can remember a fraction of what they were taught?—an evidence that most of it was not assimilated; and mental food improperly digested is of about the same value as some physical food swallowed without mastication. All this is bad when dealing with grown up people, but with the plastic mind of a child (weakened in many cases by wrong dietetic ideas rampant in the land today), it is nothing short of criminal.

The zeal of teachers often outruns reason; more particularly is this the case in private schools where those pupils who show more than usual aptitude for learning are seized upon as good advertising material and crammed in a manner akin to the wretched geese in France for the making of that epicurean delicacy “pâté de fois gras.” It goes without saying that the young mind in a great number of cases is unable to retain all this mass of cramming, and like bad mortar used in a building dries and crumbles away. The marvelous solidity, even at this remote date, of the Roman walls and Egyptian masonry, are fitting similes of the lasting material used in those ancient days, and we have good reason to believe that the basis of the learning of those days was equally well established.

A defect in modern education is that there are far too many subjects attempted in the ordinary curriculum of the day; better far a few, well considered, well studied, and inwardly digested. Much that is crammed into children of tender years should be left until later on in life when the assimilative power of the brain is greater. Quality is what is wanted—not quantity. The student who was once asked to go and meditate for a week on a single lesson, emerged therefrom with far greater strength than one in these days who could be set to study half a dozen or more subjects a day.

But a still greater defect of our modern system is the competitive spirit that has seized hold of education and reduced it to a mere struggle where the survival of the fittest is uppermost—where the strong struggle over the weak, the more aggressive over the timid, likening it to the wildness of Rugby Football. And the result of all this struggling is not far to seek—in place of that brotherliness of which we hear so much in pulpit and lecture hall and see so little outside, there grows around the child a spirit of isolation, of selfishness in its wider signification, a “what is there in it for me” attitude, which smothers feelings of brotherhood that should be uppermost in the mind and heart.

It has been well said that “no man liveth to himself,” but the present system points not in that direction; rather does it draw the youth to regard life as for himself alone and in place of a warm solicitude for his mentally weaker brethren, one finds a system of competition that stifles the gentler feelings and applauds him who by favorable endowments, is enabled to get ahead of his companions, arousing thereby that wild spirit of indifference for the weak and bringing in its wake the false deduction that education is not so much for enriching the mind as for passing examinations and attaining to that eminence

where the shouts of the populace ring pleasingly on the ear.

But the greatest of all defects in modern education is beyond question the abandonment of those spiritual ideals which have been and will always remain the greatest of all blessings to a nation. In the older days it was not thought singular that spiritual exercises should form an essential part of education, with the result that the students of the palmy days of Egypt and Greece associated spiritual things with their daily life. Well did they realize in those days that while Geometry had a value as a basis of logic, its greater value lies in the conception that “God geometrizes.” History to them was more than a mere picture of the world's happenings in the past; it was a panorama of the rise and fall of the nations on the world's stage, following the evolutionary plan of the gods. Religious rites, with their sublime mysteries were not regarded as mere subterranean peep-shows (as some masonic writers have imagined), but were sacred dramas wherein the candidates were made actually to experience various trials and ordeals, hints of which remain to this day in Masonic ceremonies.

No system of education will give success that does not keep in view the psychological fact that learning is not to “hammer in” but to “draw out.” Some philosophies teach that the human mind is latent with power, knowledge, and understanding, and that it only requires the fit environment to call them forth. To accomplish this the broadest possible viewpoint should be aimed at; for it is easier to descend from the wide plane of generals to particulars than to rise inversely. The consideration of problems of whatever nature from Cause to Effect is a method that will eventually find its way into Occidental teaching; and when it has found its home among us, then education will have received an impetus that will make the present systems seem laborious and truly out of date. For the ultimate of it all is to bring knowledge to the growing men and women so that they will echo and make their own through life that sublime outburst of the Psalmist:

Happy is the man that findeth Wisdom and the
man that getteth Understanding:
For the merchandise of it is finer than the merchandise
of silver and the gain thereof than fine gold.
F. W. P.

THE truest and fairest thing of all, as regards education, is to attract the mind of the pupil to the fact that the immortal self is ever seeking to bring the whole being into a state of perfection. The real secret of the Rāja Yoga system is rather to evolve the child's character than to overtax the child's mind; it is to bring out, rather than to bring to, the faculties of the child. The greater part is from within.

The teacher evokes the ideals and fosters them; he points to the path so that the day comes in time when the child finds its place, following instinctively first, afterwards intuitively. A teacher may be familiar with Rāja Yoga methods, but never can he become the true guide to the child until his intuition is sufficiently awakened to apply the Rāja Yoga methods to the individual needs of each pupil. Consequently it happens that of the teachers, many are called but few are chosen.—*Katherine Tingley* (“Some Notes on Point Loma”)

THE SHELL

UPON a mountain height far from the sea
I found a shell,
And to my listening ear this lonely thing
Ever a song of ocean seemed to sing,
Ever a tale of ocean seemed to tell.

How came this shell upon the mountain height?
Ah, who can say
Whether there dropped by some too careless hand—
Whether there cast when oceans swept the land,
Ere the Eternal had ordained the Day?

Strange, was it not? Far from its native deep,
One song it sang:
Sang of the awful mysteries of the tide—
Sang of the misty sea, profound and wide—
Ever with echoes of the ocean rang.

And, as the shell from the mountain height
Sang of the sea,
So do I ever—leagues and leagues away—
So do I ever—wandering where I may—
Sing, O my home! sing, O my home! of thee!
Eugene Field (Selected)

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question What answer would you give to the statement: "So far as I know, I was never asked to come into the world and I shall not be asked to go out." What light does Theosophy throw upon this?

Answer Justice rules the world, and we are here for some good purpose; our manhood demands that we should posit so much. The belief in virtue is more innate than the passions, and only vanishes when the passions have been allowed to reign and ruin. If it were not true that there is some foundation and decent order in the universe, it would still be for us to live as if there were; it would cost no more, and we should come out the cleaner. Until we have fouled life, and botched up all its springs and delicate workings we do see some virtue and worth in good, clean manhood. Supposing there were not one jot of philosophy to be found anywhere, and all life a bottomless, ridiculous jumble of fortuities, as some of us suppose it; we ought still to stick to a few things such as courage and clean living; because, no one need argue about it, a clean, brave man is better than a worn-out debauchee. There we have one solid axiom at least, on which we may build up our philosophy. Virtue is virtue, never mind who condemns himself by denying it. A dogma? One, then, which you may safely live and die by; all history proclaims it, and it has never been found wanting.

There are wild stories afloat of an ape-like club-bearer in the forest, supposed to be the first man; but the picture is untrue to all our instincts, experiences, and racial memories. History shows us that the course of things was always the opposite of this. Races of heroes descended into the plains, waxed fat, and wasted their virtue in riotous living, and then—evolved subtle pessimisms out of their ailments, and invented theories of their descent from apes. Imagination could do no better; it had spoiled itself planning ignoble delights. Your misanthrope was ever a sensualist at one time.

Such debauched general imagination is responsible for all these whining doctrines. *I never asked to be born*, says the worn-out, not brave enough to face the stern remedy (for

pain is that, would he but recognize it). *Let me never rise to being a man; let me find a scape-goat; blame fate; sit down and bewail my hardships; anything but own I was wrong; anything but face round and forge my way upward. I am not responsible. I am a poor mean victim, cruelly and unjustly used. The limp shirker is the best man: it is well to steal what sweets we may and sneak down to the grave by the easiest roads.* This, in plain language is the creed of him.

Have we no right to demand a little manhood of each other? Have we no duty to take up a manly doctrine, and hold manly ideas? You never asked to come into the world! What? You never held a desire that could only be gratified in this physical life? Never hankered after sense pleasure; ate unwisely or overmuch; experienced or obeyed passion? Then how came you by that disordered liver, or those jangled nerves, which lie at the root of your pessimism? Tush, man; you cannot be at the same time hungry and overfed!

There should be a little clue for you here, as to whether you ever asked or not. You cannot dismiss yourself with a few paltry phrases—*I am, I do not desire to be*, and so forth. What is it that you are? Existence, the uneraseable thing; by nothing can your essence be dissolved. That meager *I*, when we examine it, becomes infinitely complicated and extensive; there is a world within you, with its gravitation and all natural laws; a world, a paradise, and the unfathomable pit. You spin your fate out of yourself; nothing comes to you, except what was desired and demanded. Do we not grow up to our ideals? "As a man thinks, so he is"; what he desires to be, he inevitably becomes. What battalions of forces there are in a man, that must have play in this world. Capacities, possibilities, designs, imaginings—why, he may build a nation, open up waste continents, do heaven knows what or what not—and is there no energy stored in advance to accomplish it all? Was Napoleon, or Mahomed, a thing that started into life at one birth, and before was not; not accumulating, not preparing, not being molded by long experience and exertion of will?

Each one of us came into the world with intricate potentialities; with a character of some sort, and degrees of fitness or unfitness for use. *A* came with a propensity for drink; *B* with all the attributes of a hero. Do not attempt mystification with the answer that their respective ancestors, or some of them, were so given; what has that to do with *A* or *B*? So-and-So, with a clean mind, has a clean body, or will soon make his body clean; So-and-So, foul-minded, is going to shatter and corrupt *his* body. It was you yourself who evolved and carried the desires; nobody can build your character now; but you yourself must do it; and nobody provided the character with which you started life. You made it; you were alive when you made it. You desired then, and have come now upon the fruit of your desires. Blame no one if it be Dead Sea fruit.

But Theosophy does not end there; or it would be mere spitefulness and no more manly than the creed it condemns.

Unto each his handiwork, unto each his crown
The just fate gives
Whoso takes his burden up, and will not lay it down,
He, so dying, lives.

And he, so living, lightens the load of the whole world; and undoes the mistakes of his past. What a glorious thing is life, in the light of this teaching. Every event that you meet, you may unload from it bright destinies; every sorrow shall be for you what contact with the earth was for Antaeus of old. Is your life a kind of hell? Then remember that the Gods are raiding hell; and that you are also of the Immortal Kindred. The spoils are imperishable treasure; wisdom, compassion, ever-growing bravery. The world is to be made perfect; all life is to be flawless and divine. Who will not covet his share of the glorious work? K. M.

Answer II. A great deal is contained in this "so far as I know," and it is quite pertinent to ask *who* or *what* is this *I* that is speaking and how far does its knowledge extend. Speaking of the average humanity, our knowledge does not extend very far, does it? And this present brain-mind person who asks the question and demands some explanation, some reason, for its existence, appears to have, and in fact does have, a very limited range of vision and recollection. He can remember only a very few isolated circumstances in the earlier years of his life, say before he was 3 or 4 years old, and many have no positive recollection of those earlier years at all. In fact this brain-mind person had no existence as such before this present life, and as most people live today we might ask, how much is there in their lives really worthy of a place in the eternities?

If then this person, as he shows himself ordinarily, and which usually he thinks himself to be, had no existence before birth—of course he could not be asked to be born. The question from this standpoint is absurd. But once we grant that the brain-mind person is not the whole man, nor yet the principal part, though seemingly he fills most of the present narrow horizon of life, and the question is an entirely different matter. To assume that one could be asked to be born assumes pre-existence, and assumes another nature than the personal transitory nature. And here Theosophy can shed great light. It teaches that back of the personal man, the brain-mind person as we have called him, is the higher divine nature, the spiritual person, or individuality, the real Ego; and that this Ego is immortal. Furthermore, it teaches that it is not only in the Law that this Ego shall incarnate again and again, but also that it is will and desire of the Ego to do so and to fulfil the Law.

To assume that we were not asked to be born, to put it in plainer language, that we were born against our will appears very much like an excuse for shirking the responsibility of life. It is unmanly, unwomanly, to whine thus. That we are here is a fact, and that we have duties to perform, aye, and obstacles and difficulties to overcome, should stir the manhood in us "To strive, to seek, to find, and not to yield."

And if one will study Theosophy, he will find there the explanation of that which perplexes him so much; he will find the true teaching regarding himself, his place in life, his duties—performance of which is the only true Joy—and the glorious destiny awaiting everyone who finds *himself*. STUDENT

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unites the philosophic Orient with the practical West

Apollonius of Tyana

ALIFE of Apollonius, by Dr. F. W. Groves Campbell, is briefly reviewed in the *New York Times Saturday Review*. Berwick's version of the *Life of Apollonius*, by Philostratus, is extremely rare, and few save Greek scholars are able to form an independent opinion based on the only known authoritative account of him; but the above-named review thinks that it is open to question whether the work of Philostratus is a genuine transcription and enlargement of the earlier manuscripts left by Damis and Maximus of Aegae or whether it is largely or entirely fabulous; and that J. A. Froude, who adjudged Apollonius "a blackguard and an impostor," had an illustrious predecessor in St. Chrysostom. By setting up Apollonius as a sort of Antichrist, continues the review, the real beauty and value of his work and life have been overshadowed; he was the fine flower of Hellenic paganism. His birth occurred in or about the same year as that of Jesus, and is reported to have been attended by signs and portents befitting a son of Apollo and a mortal woman; and he performed various miracles paralleling those of the Christian Gospels. His teaching was far removed from Christianity; he practised asceticism and healing and led an eremitic existence for some years; later he traveled extensively, and became an adept in the mysticism of India; and was received in Egypt with acclaim, and bore the reputation of a seer, saint, and philosopher. His thought was largely Pythagorean; he repudiated the materialism of current religious activity, and would seem to have arrived at some conception of a glorious unity in all life, in which the gods were identified with one supreme power; and birth, growth, death, and decay, were merely manifestations of the continuity of life. If the sayings attributed to him are authentic, his doctrine becomes a high and noble expression of all that was uplifting in later Paganism. He lacked the element of love and tenderness which marks Christianity [!], and was too finely Greek to have opened his heart to humanity in its sin and suffering. It was a purely masculine philosophy, sublimated beyond the reach of all but those whose minds dwell on austere heights. He was, however, greatly loved, had a remarkably attractive personality, and drew many loyal followers. He lived to a great age.

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

So much for this review. From the *Encyclopaedia Britannica* we learn that Apollonius, while yet a youth, renounced the ordinary pleasures of life, abjured flesh and wine, lived on the fruits of the soil, wore only linen, and slept on the hard ground. He observed the Pythagorean five years' silence and suffered painful trials without a murmur. He awed an excited populace to silence by a wave of his hand, performed "miracles" with a word, and knew all tongues without having learned them. He traveled over Assyria, Persia, and India, conversing with Magi, Brahmins, and priests, preaching a purer religion than what he found, and being received with reverence everywhere. On his return the greatest reverence was shown him by the Grecian priests and oracles; and he visited many other countries with the same results.

Justin Martyr inquires in dismay:

How is it that the talismans of Apollonius have power, for they prevent, as we see, the fury of the waves, and the violence of the winds, and the attacks of wild beasts; and whilst our Lord's miracles are preserved by tradition alone, those of Apollonius are most numerous and actually manifested in present facts (*Quaest.* xxiv).

But this power is easier to understand when we remember that Apollonius went to India, having left behind all his disciples, and accompanied only by Damis, whom he met on the way, and was initiated by the "Sages" beyond the Hindû Kush.

Ralston Skinner, in *The Source of Measures*, notices the remarkable similarity between the account of Apollonius and that of Jesus, as though one of them were copied from the other, and regards them both as allegories representing a symbolical drama used in the Mysteries. It cannot be exactly defined to what extent such narratives are historical and to what extent allegorical, because those who constructed the mystic dramas had a way of using as their *dramatis personae* and *mise-en-scène* actual personages and events. In the case of the Christian Gospels, it seems pretty clear that such a mystery-drama was woven

around the personality of an alleged Teacher, for whose actual existence we can find little or no evidence, but whose life may well have been made up out of incidents taken from the life of some Teacher or Teachers.

It is noteworthy that even prejudiced writers are obliged to concede so much regarding the merits of Apollonius. They

sniff, of course, at his miracles; yet those miracles are better attested than those of Jesus; so there remains no reasonable choice but to reject Jesus' miracles also *a fortiori*.

To a Theosophist, who does not believe in miracles, but who does believe that man can develop in himself a power of command over Nature far superior to that possessed by average humanity, the claims made about Apollonius will not even seem in need of denial. Apollonius, we are told, underwent the purifications and initiations necessary to such attainment. He was a Sage, and there seems to be little doubt that his function was to keep alive, in an age of declining faith in man's divinity, the knowledge of the Ancient Wisdom-Religion, which comprises the knowledge of that essential Divinity. In view of the cyclic period at which he appeared, he may be compared to a setting sun, ushering in the night, but promising a future golden dawn.

One cannot let pass without comment the remark that Apollonius "lacked the element of love and tenderness which marks Christianity, and was too finely Greek to have opened his heart to humanity in its sin and suffering"; because such a criticism comes with an ill grace from the mouth of a civilization like ours, where the sin and suffering of humanity are so rife and so little heeded. We can scarcely afford to criticize Apollonius from our present pedestal; and the real question is whether the sin and suffering of humanity would be worse if we were now living under the light of Apollonius' lofty philosophy instead of under the travesty of Christianity under which we are actually living. H. P. Blavatsky, in *Isis Unveiled*, says that Apollonius inculcated the same quintessence of spirituality and the same high moral truths as Jesus. She adds that he confined his teachings too closely, perhaps, to the higher classes of society. But she could better afford to criticize. When we have succeeded in living up to the ideals of mercy and compassion for

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

A VERY interesting and instructive paper on Theosophy and Darwinism was read at Isis Theater last Sunday evening by Professor C. J. Ryan. After referring to the Darwin centenary which is celebrated this year, he spoke of the work of the great scientist as being as revolutionary in the world of thought as the invention of the steam engine or the telegraph in the world of action. Charles Darwin was a liberator, replacing the dogmatic literal interpretation of the Hebrew scriptures by a broad conception of natural law.

The importance of the subject of evolution is very plain, for its study compels a man to choose between the materialistic and the spiritual interpretations of Nature and Life. In Oriental philosophies the belief in the unfoldment of all separate existences from an Eternal Divine Unity has always been held, and highly complex theories of evolution have been given to the world by the ancient Indian, Persian and other teachers, veiled in allegory.

The conflict today is not so much between the theory of instantaneous creation of all things in six days and the broad idea of evolution, as between the opposing principles of materialism and spirituality in the interpretation of evolution. Theosophy has no quarrel with the general principle of evolution, but it regards the scientific theories as gravely deficient in several vital points.

In Darwinism a purely mechanical explanation is offered for the marvels of the organic world; there is no suggestion that the variations tend in an upward direction; it is supposed that all kinds of changes take place, good, bad, and indifferent, the so-called "Selection" being merely the survival of the possessors of those changes which happened to give them a momentary advantage.

Theosophy, on the contrary, sees a guiding tendency, an intelligent force behind, as the "moving spring." It should be said, however, that a large number of modern evolutionists are not satisfied that the blind force theory explains anything, and it is being seriously doubted whether Natural Selection and the Survival of the Fittest, taken alone, have really a leading part in the production of the wide distinctions between the main types of living forms. Some are suspecting that there must have been a design, after all, which produced variations leading to a definite object.

The first difficulty the Theosophical student meets in Darwinism, is the incredible suggestion that the vast complexity of form and function, the exquisite perfection of species, and especially that man "with his moral consciousness, his genius, his religious aspirations, and the feeling of his immortal nature," should be the outcome of nothing but the fortuitous struggle of blind force and material atoms. Is it not infinitely more thinkable, as Theosophy teaches, to believe that there has been a distinct aim in the Universal Mind towards an ideal Man—a perfect type? Theosophy sees One Life consciously evolving under innumerable forms, struggling with Itself, we may say, to reach higher and ever higher expressions. In short, the main contrast between Darwinism and Theosophy lies in the fact that the latter regards the *vis a tergo* as the chief factor in evolution.

STUDENT

Apollonius of Tyana

(CONCLUDED FROM PAGE 10)

the lowly which we profess as being those inculcated by our Master, we also may be in a position to criticize Apollonius, but not before.

It is a noteworthy sign of the times that so favorable a view of this great Sage should have been taken; and it illustrates the fact that our opinions of the great characters of the past improve in proportion to our own capacity to appreciate them. We have lately come more to believe in the perfectibility of man and are more ready to accept the possibility that perfected men may have existed; and our respect for ancient civilization deepens with each new archaeological discovery. Let us accept this recognition of the greatness of the past as a token of the greatness of the future, and remember that as man has fallen, so he may rise again. But the conditions need to be prepared; for, such is the narrow personalism of the age, that we regard higher powers in the light of personal acquisitions, to minister to personal pride or love of power. A single human being endowed with great powers like Apollonius or Jesus, would not be able to manifest himself openly today, but would have to come in disguise. So it is necessary for men to make a collective effort to realize more of their higher possibilities and to cultivate the Christian virtues, and then it may be possible for a Teacher to come among them and teach them.

STUDENT

Some Cults and Cranks

Ultra-Violet Rays for the Soul

"THE Soul's Response to the Ultra-Violet Ray" was the subject of a lecture given by a lady at a club. The desire to do something which seems to be impossible is due to the vibrations of this ray; the slang expression, "Wouldn't that jar you?" refers to the lower vibrations of ordinary life which impinge upon our souls and harry them.

It seems likely that those rays of the spectrum which do not impress us physically operate more directly on the finer substance of our corporeal nature; but to call the part thus affected the "soul" is misleading in view of the other meanings for which that much-abused word has to do duty. It cannot be anything higher than the *linga sarira*, or subtle inner body, which is interwoven with our physical body, and which is (as it would seem) disintegrated by the rays proceeding from radium and affected by ultra-violet rays. In fact, having in view its susceptibility to actinic rays, we may aptly compare this "soul" with a photographic negative, which it resembles both in its negativity and its power of receiving impressions.

Babism in America

BABAISM or Babism would seem, according to a press report, to be among the new cults making way in this country. Reference to current sources of information will tell the inquirer that Babism originated with Seyed Mohammed Ali, born at Shiraz, Persia, about 1824 or 1814; that in 1843, on his return from a pilgrimage to Mecca, and after a long meditation, he presented himself in his native city with a journal of his pilgrimage and a new commentary on the Korân; that the clergy were exasperated by his doctrines and his criticisms of their lives, and forbade him to

preach in public; that he thereupon instructed his disciples secretly; that as his teachings advanced, he claimed to be the herald of a new dispensation and the focus in which all previous revelations converged; that eventually the new sect led to civil war, in which the founder was executed; that it continued after his death under a new leader, and prevails widely under the surface in Persia as one of the signs of the incompatibility between an Aryan people and a Semitic religion.

According to a newspaper account, Abdul Baha, the son of the founder, who was confined in a state prison at Acre, is now free, but still resides at Acre, which has become the Mecca of the cult. It is by his direct command that the first important temple, the Mashrak-el-Azcar, is to be erected—in Chicago (!). The cult has been growing silently in America for more than a decade, and includes believers from Persia, Japan, Russia, India, China, South America, Turkey, and the Philippines. They believe that the founder was the latest and greatest prophet of God; and claim that he has left books of sacred writings more numerous than those of all other prophets combined, and that Abdul Baha is the true interpreter of them. The teachings seem to be "Love" and universal toleration subject to the proviso that their religion is the culminating one; otherwise the tenets are vague, or at least vaguely expressed.

Mere Arid Ethics

A PAPER, writing on "New Religions," mentions the case of a clergyman who urges Christians to get rid of doctrinal survivals, old customs, and rituals; and then refers to an Ethical Culture Society, which is suffering from a lack of these accessories. This ethical society lacks color, and is therefore losing its hold on the young, especially young women. "Mere arid ethics" will not hold the congregation; so the leaders are going to see what stained windows, mural decorations, and an organ will do. Thus, says the paper, when men do get rid of old forms, they have to invent new ones.

This comes of restricting the scope of "ethics" to that which is "arid." Ruskin wrote on the ethics of the dust; his gospel was that art and morals were indissoluble. Nothing ugly or barren can really be ethical. You cannot feed a man by cutting off essential parts of his diet because they are not of the best; you must replace what you take away by something better.

Ritual is not essentially wrong; but it almost infallibly becomes perverted. It should be regenerated, not extirpated. Doctrinal teachings, however erroneous, are usually derivatives or imitations of doctrines that were right and good. Ethics and morals cannot rest on mere sentiment; they must have their roots extending in all directions; they need an intellectual basis; they must find a sanction in the canons of true being; in every relation of life, an apprehension of true laws and an endeavor to apply them, must constitute what we mean by ethics.

Ethical societies may be compared with composite photographs. A composite photograph is made by combining a number of portraits in such a way that all the individual traits of the different persons are eliminated, and there remains only that which is common to all. The result is an utterly characterless face. So

in purely ethical societies all sectarian features are dropped, and what remains is that which is common to all sects — very little.

And so we are obliged to invent new doctrines and rites to take the place of the old ones. For the Light from within, which illumines man, is a twin ray — *Pistis-Sophia*, — Inner Illumination and Knowledge; the former of the two representing devotion, aspiration, and the sense of moral obligation; the latter representing wisdom, knowledge, balance. We cannot hold humanity by a religion composed of the former element alone; its intelligence demands to be appealed to also. Yet we have divided the program between religion and science, so-called; religion looking after the devotional side, and science after the intellectual, and the two being mutually opposed instead of complementary. In ancient times there was a "Gnosis," or Sacred Knowledge; the ancient books of India and other countries show that religion and science were one, and *not* separate. There have been in our day various wild attempts to create such a system; but they have not succeeded in establishing their title to a general acceptance. That title depends on the question of efficiency and on nothing else; when humanity finds what it needs, it will embrace it. Consequently we await the power that can prove itself able to satisfy such needs, and that can only be a revival of the ancient Gnosis, such as the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY aims to bring about. H. T. E.

God and the Aeroplane

THERE is a wonderful ceremony which takes place in France on occasion. It is named the ceremony of St. Hubert. This is the gentleman, it will be remembered, who in the good old days, from a hunting squire became a bishop. As a huntsman he was probably courageous enough, but when a stag bearing a crucifix met him and threatened him with eternal perdition if he did not cease to neglect his religious duties for the pleasures of the chase, he entered a cloister. Which is not surprising, under the circumstances. Nor is it entirely surprising that being the son of the Duke of Aquitaine and cousin of King Pepin, he found the path of religious promotion none too difficult. He became bishop of Liege and the apostle of Ardennes and Brabant and finally, since promotion in the church does not seem to be inhibited by death, this worthy country gentleman was elevated to the rank of a saint. This is a rank, we understand, that calls for no fees to be paid to the College of Heralds or its ecclesiastical equivalent, nor have there been any known instances of refusal of the title, not even when the Gentle Breezes became, under their Latin name, two distinct Saints, Saint Gentle and Saint Breezes (*Cf. Isis Unveiled*). In that day there was more demand for Saints than for an intelligent acquaintance with Latin.

The ceremony of Saint Hubert is still extant and has been quite recently carried out with all due solemnity. The hounds are blessed by Bishop or Priest in full canonicals and sprinkled with holy water before going to the hunt. The central idea seems to be that by this a ceremony-loving god will be coaxed into seeing that the canines do not turn and rend their masters when no more suitable quarry should be forthcoming, as they are reported

to have done on an occasion when they were kept fasting to make them more savage.

But this is fast becoming one of the picturesque ceremonies of the past, as hunting yields to civilization. We cannot tell whether the comments in the CENTURY PATH as to the churches following where they do not know enough to lead, have been taken seriously, but there seems to be justification for the belief that they are making a strenuous effort to keep pace with the times in the past few months. The Deus ex Machina is now invoked for something more up-to-date than a mere pack of hounds. The Deus extra Machinam is called upon to do nothing less than see that aviators do not break their necks pending the time when some ecclesiastical Burbank shall evoke once more the pristine race of humans before the fall — which seems to have resulted largely from their loss of wings.

We read that in "the year of our Lord" nineteen hundred and nine — 1909 — 1909 (no less) — the Archbishop of Paris, at Juvisy, solemnly blessed a new aerodrome and two aeroplanes. Received at the entrance of the aerodrome by the committee, the Archbishop with his clergy was escorted to a gilt throne on a raised, covered stand. There was a score of clergy in surplices and stoles, as well as numerous choirboys. The aeroplanes were decorated with tricolor ribbons and placed in front of the stand.

This would sound like a picturesque old ceremony, but we are assured that "five hundred fashionably dressed people were present" (*London Globe*, April 2, 1909).

Then the Archbishop delivered his address, in which he said:

Man by his original fall lost the sovereignty of the air, but the present inventions permit it to be hoped that man may be allowed by Divine grace to regain some small fragment of his original sovereignty. The Church is therefore happy to bless these machines destined to soar through space and conquer realms hitherto beyond man's domination.

The crowd then bared their heads and the Archbishop offered a short prayer that no accidents might happen to those using the aeroplanes. "May we, like aeronauts in aeroplanes," he added, "rise above the earth and lift up our souls in gratitude to the Divine Author of all inventions." The machines were then sprinkled with holy water and the blessing was pronounced.

This ceremony deserves to be put on record for future ages to marvel at. Think how interesting it would be had we the authentic records of the inauguration of many such a ceremony whose beginning has been lost in the dim vistas of the past.

Let us emphasize the date therefore — 1st of April, 1909. P. A. M.

The Opium Trade

TO discuss whether commerce is good or bad is like discussing whether a man is good or bad; he may be either. To discuss whether the extension of commerce and the promotion of industry are good is just the same. A man may be infectious or a bad character; but if we shun him it does not mean that we shun humanity.

So with trade. If one is often obliged to disparage it and to question the advantage of extending it, the objection is not to trade in itself but to trade as it often is. Hence if

trade wants to get a good name it had better clear its character.

And there is likely soon to be a pretty definite issue between injurious forms of commerce and industry and the awakening sense of duty and responsibility in the nations. The opium traffic is one point about which it seems to be centering. It would seem that recent international efforts to come to a decision with regard to its suppression in the interests of China have proved practically abortive; and there is no escape from the conclusion that it is commercial interests that have been the obstacle — commercial interests interwoven with governmental ones. For we can hardly be expected to take seriously the pronouncement that "the practice of smoking opium when indulged in with moderation is relatively harmless." It is true, of course, but hopelessly irrelevant; and the qualifications make it absurd. It is admitted that even moderate smoking is harmful — for what else can "relatively harmless" mean? And of course immoderate smoking must be still more harmful. So we cannot take this as a serious reason for not stopping the opium trade.

Then think of the humor of going on with the cultivation and exportation while at the same time issuing recommendations to authorities to use legislative and police restrictions to prevent the use of opium derivatives like morphine; and other amiable advice. And still more, what are we to think of the proposal that scientific men shall investigate the effects of opium and find out to what extent it is injurious? Shall we be blamed for calling this *cant*, and very capital *cant*? Does the world need convincing? Are the Chinese perhaps mistaken in their belief that opium is injurious?

The outcome of this effort is proof that the civilized nations are not yet strong enough to stop a maleficent commerce in the interests of humanity; and the reason is lack of union and lack of faith in the might of right. Is this the kind of trade which is to be promoted by making new unions of nations, or by opening up new countries? If so, we had better think twice before going into heroics over these grand schemes. And even if the intentions are good, how do we propose to prevent this kind of trade from getting in its foot? The only power that can stop such things is the resistless power of a body of people of all nations, united in the great Cause of Truth, Light, and Liberation, and willing to sink all personal and sectional differences. STUDENT

The Diurnal Air-Waves

AT 10 a. m. and 10 p. m. apparent time, there is an increase of air-pressure at any station on the earth. Assuming for the sake of simplicity that increased pressure means locally increased atmospheric height, it might be represented by superposing on the equipotential spheroid an ellipsoid with its longest axis on the equator pointing permanently 30° west of the sun, having its shortest axis also in the equator, and its middle axis along the polar axis — the spheroid rotating within the ellipsoid. Yet why should the ellipsoid of the air remain fixed at a constant angle ahead of the sun? At St. Helena a diurnal variation of the trade-wind has been observed, at 10 a. m. and 10 p. m., corresponding to a north-east component of one mile per hour. J.

Okina fukuro ni nani ga are
[or freely rendered in deference to the metre:]
Little ant, little ant, where are you going?
What are you carrying in that big sack?

THE old familiar dactylic hendecasyllable yet can it be possible? on a page whose syllabics write themselves down not horizontally but in lines as vertical as the obelisk of Thotmes III, in a script so antipodal to our Roman type that it mostly suggests to the mind some stately and very straight processional of baby ducks, their tiny toes well blackened for "toe-print" impressions, and in a book whose (to us) last leaf is the first and which, if we read it at all, demands that we begin at the right hand side of the page! Stranger yet, in a tongue whose grammatical construction is at once simple and inconceivably difficult and a little study of which leaves one wondering what a verb really is and whether the Greeks and Latins have not been wasting a deal of time for us all these centuries by bequeathing to us those "rules"! And yet there is the same old music in the lines that we find in our Horace, or Virgil, or Swinburne, or Longfellow, or Lowell, and strip away these outer differences—these sheaths which hide the soul of things as well as of people—and we see that the mind is the same, the heart-life the same, and human nature is the same, the world around.

It is only a child's little paper, a magazine published in Japan for Japanese children, that lies upon the desk. Yet what a charm do its pages hold! What living proof that though seas divide and men speak diverse tongues, though manners, customs, dress, and institutions may differ as do the inner and the outer of a vase, yet the same ideals take root and grow like fair flowers in the heart-life of all. And we grow a bit in humility, turning the pages of the little book, reflecting how some who seem least to care for the feverish hopes and pains of European "civilization" are, somehow, so close to nature! For there are all the evidences—pictures, and also stories in meandering Hiragana and the more proper and merciful Kana, all witnessing a closeness to nature and to the simplicity of life that very few children's magazines of Europe and America can detail so well. It has something, much indeed, of the Râja Yoga import and

heart-touch shining for us out of its pages.

For here they are, the old familiar types that interest little children so much and so for ever and ever—tiny tot "helping" mother to cut out paper dollies, the two little boys who go out on a hill one dark night and there see a comet, the big green ogre who comes in when you aren't looking and sends your papers a-scurrying to the floor or blows the light out for you, the hunter (who does not succeed, says the story, in snaring the little bird perched so amazingly near), stories of how the rice grows, of the grapes that hang over the arbor, of the wise old crow who (one can never say "which" about the nature-life in Japanese books), very much thirsting for some water at the bottom of a jar, be-thought herself for a moment and then promptly filled the jar with stones! But how

and that and who blows and blows and nobody can see him, of the busy ant and the lazy little grasshopper—all these are as tales of genii, gnomes, sylphs, fairies. They open before the little budding mind and heart wonders to which those of Aladdin's palace would be the refuse of an attic store-room. All things are so irradiant of that Divinity from which the child so lately emerged, the viewless flower of which he is guarding, albeit unconsciously, in his heart of heart. And really the child is right—these things so common are never commonplace except to ourselves who, with blue glasses and wrinkled brows, think we ought to proclaim them so.

Kore wa ine de ari masu watakushi tachi ga mainichi taberu gohan wo . . . and so on through the simple little tale that unfolds all the miracle of the seed and its cyclic life-

journey, of how the farmer cares for the young rice and all about its little life so far as the outer sense can know it. Simple? Yes, but we do not put *Hamlet* or *Macbeth* into the pages of our own books for children, so let us not be captious that the Japanese tales, often so dramatic, are not those of Bakin, or Chikamatsu, or Motoôri. The pictures are full of charm, not expressing the very highest of Japanese art, to be sure, but as full of living joy, of spirited strength

and of naïveté, in their own way, as the best of Hokusai or Harunobu. Indeed something in one or two pages, much as there is to be desired from the standpoint of pure art, makes us feel as though it were not an impossible reach to Chosun, that master of the color-print, whose own picture-books are almost the loveliest things in the world. It is the *spirit* of Japan that we feel, that inner something which speaks though the technique be not perfected, which the traveler often perceives in the pottery of the humblest Japanese home, for instance, as well as in Japan's priceless heritage from the kilns of Arita, Kyoto, or Owari.

One cannot help dreaming ahead of things just a few years. With East and West clasping hands, heart appealing to heart, with little children on both sides of the Pacific serving the same ancient and honored truths, loving the same principles, growing like flowers beneath the same sky of hope and in the sunshine of eternal ideals—who shall say what dreams a little time may not bring into the land of work and patient actual doing? STUDENT

Lomaland Photo. and Engraving Dept.

THE FAMOUS AND VENERABLE NIKKO SHRINE

ÂTMÂ . . . is neither your Spirit nor mine, but like sunlight shines on all. It is the universally diffused *Divine Principle*, and is inseparable from its one and absolute *Meta-Spirit*, as the sunbeam is inseparable from sunlight.

Helena Petrovna Blavatsky

did the Japanese get that tale? From ourselves, or we from the Orient? When folklorists and archaeologists are through perhaps we shall no longer write "mine" and "thine," but in chastened humility, "*ours*."

Yes, childhood is in essence the same the world around. And how this unity of love and life shines out through these simple—so very simple—little nature-tales, descriptions and wonder-fables that children everywhere love with all their hearts. For—and we really shouldn't forget it so often—the world is so big and so very very new to the outer eyes of a little child that the story of the growth of a blade of grass, of the nesting of birds, of the wind-giant who sweeps things this way

Bienaventurados los misericordiosos: porque ellos alcanzarán misericordia.

San Mateo, v:10

Doña Marta Abreu de Estévez

IT is easy to pronounce a eulogium upon Mrs. Tingley. She has been the Marta Abreu of two cities of the republic, Santiago, and Pinar del Rio. Can anything more than this be said? Or anything more just? She has taken the Râja Yoga teaching to those two extremes of our country. How could we do otherwise than receive her with an affectionate welcome! The aphorism of Don José de la Luz: "To educate is not only to fit for a life career, but to attune the soul to life," is the motto and device of Mrs. Tingley.

We have made great progress in the political world; we are independent, but that is not sufficient. With a soil rich enough to make our country progress by itself, just as a body launched into space and subjected to the laws of inertia only needs for its advance the condition that none shall hinder it in its career, so we ourselves go from progress to progress. The soil is rich, and hunger and misery are unknown here in normal times. But, how are we progressing morally? The evil of the century pervades and enervates us. Old branches of an old tree, we need new sap for our shoots. We lack a support, an ideal, a new teaching: a belief and a faith to serve as a basis for our progress—the belief in the high destiny of humanity, the faith that we can fulfil it by our effort. Mrs. Tingley has the magic wand in her hands, she will cure our sickness with her schools.

The above translation from the Spanish is part of an article published in one of the leading papers of Santa Clara, Cuba, *El Demócrata*, Dec. 12, 1908, upon the occasion of Katherine Tingley's visit to that city for the purpose of establishing a Râja Yoga School and Academy. It will be recalled by readers of the CENTURY PATH that Mrs. Tingley visited Santa Clara in response to an urgent invitation from the Mayor and Councilmen of the city, and that her few days' sojourn there was really of the nature of an educational festival in which the whole city joined, so enthusiastic had the citizens become over reports of the success of the Râja Yoga system in the cities of Santiago and Pinar del Rio. During her stay the phrases, "She has been the Marta Abreu of two cities" and "She has come to carry forward to perfection the work which Doña Marta began," were heard on many lips.

Á MI MADRE

MADRE augusta, constante protectora
de un pueblo agradecido que te aclama,
excelso corazón que el bien derrama,
ángel de caridad, luz bienhechora.

¿Por qué mi pecho que tu nombre adora
no ha de cantar tu merecida fama,
si mi gloria eres tú, si eres la llama
que ilumina mi mente soñadora?

¡Ah! Quién pudiera en atrevido vuelo,
persiguiendo de Dios las sacras huellas,
batir las alas, remontarse al cielo,
Y con la misma luz de las estrellas,
dejar tu nombre para siempre escrito
en la bóveda azul del infinito.

Pedro Estévez y Abreu

TO MY MOTHER

(Translation by a Student)

MOTHER magnificent, steadfast protector!
In gratitude a city sings thy praise.
Thou heart exalted in compassion's ways,
Angel of charity, our benefactor!

Tell thou me, wherefore shall my heart decline,
Adoring thee, to sing thy true-earned fame,
Thou who my glory art, the sacred flame
That lighteth every vision of my mind?

Ah, that I dared in bold and upward flight,
Following the sacred footsteps of our Lord,
Mount ever winging toward th' eternal light;
And with star-flame, as 'twere some shining sword,
Leave thy sweet name imperishably graven
High on the very vaulted blue of heaven.

Doña Marta Abreu de Estévez is known and loved by the inhabitants of Santa Clara as one of Cuba's greatest workers for the common good. A woman of culture and wealth, happily married, and her life filled with the duties belonging to home and motherhood, she might have been considered worthy of esteem had she confined her interests to the narrow circle

of her personal life. Yet her heart went out to the suffering poor about her, to those deprived of educational advantages, as many necessarily were owing to the stress and strain of Cuba's struggle for independence, and to the city as a whole. Outside of private charities, mostly unknown except to the recipients, she, in this case aided by her two sisters, has for years supported two schools and also an asylum for the needy poor, where not only refuge and care are freely given but medical attention as well. During the long war, with its successive ups and downs, Doña Marta Abreu called together upon one occasion all the Cuban residents of Paris, started a subscription which she herself headed with a large sum, and raised an unprecedentedly large amount for the help of the Cuban patriots.

Santa Clara boasts of many memorials of Doña Marta, as she is affectionately called, in the shape of municipal improvements donated by her, not to mention many to which she generously contributed. Among these are public monuments to earlier workers for humanity, though when the citizens wished to honor her with a statue she declined the honor, begging them to give the money instead to the poor. In 1888 Doña Marta gave to the city four large and perfectly fitted-out public laundries, the only condition being that they be kept up for the free use of the poor. In 1894 she established and opened "El Amparo," a dispensary for poor children, where they may daily receive medical advice and treatment free of all cost. Upon the staff of this dispensary are prominent physicians and the whole is under a Medical Governing Board.

Some years before this she built a commodious theater which she christened "La Caridad," the object being to provide for the people dramatic art of a high order, all profits therefrom to be given to the city's poor. Rarely, indeed, have educational and philanthropic purposes been so graciously united. "Teatro la Caridad" is one of the most beautiful build-

ings in the city, splendidly constructed and elaborately decorated inside. Over the door is a stone whose inscription reads:

*"Erigido por Da. Marta Abreu de Estévez.
Para socorrer, en memoria de sus padres, á los
pobres de Santa Clara."*

(Erected by Doña Marta Abreu de Estévez, in memory of her parents, for the relief of the poor of Santa Clara.)

As if this were not enough, the generous benefactress a few years ago gave to the city an electric lighting plant, turning Santa Clara at night into a place of light and beauty; and also an Astronomical and Meteorological Observatory.

In 1894 the Mayor and Councilmen of Santa Clara, in general session, appointed a committee to publish a memorial of Doña Marta Abreu's work, this to be entitled "Homenaje de Villaclara á su predilecta hija Marta Abreu de Estévez," the text of which should consist of brief accounts of her various charities, of articles and poems by those who desired thus to express their gratitude to a city's benefactress, of photo-engravings of the various institutions founded and supported by her, and portraits of herself, her husband Dr. Luis Estévez y Romero, her son Don Pedro Estévez y Abreu, her sisters Doñas Rosa G. Abreu de Grancher and Rosalía Abreu de Sánchez Toledo, of her father, Don Pedro Nolasco Abreu y Jiménez, and her mother, Doña Rosalía Aren-cibia de Abreu. The entire family, it might be added, are known for charitable works although less widely than Doña Marta herself.

A copy of this memorial recently found its way to the editor's desk and from it we publish the dedicatory sonnet written by Doña Marta's son, the young Don Pedro Estévez y Abreu, though doubting if any translation can write down quite so simply, purely, and spontaneously as the flower-like tendriled Castilian the warm and tender outpourings of a son's heart. Loving Doña Marta as a mother he adores and understands her as a worker for humankind, and the flowing syllabics of his native tongue enwreath this word-picture of a compassionate soul as jasmine and laurel might enwreath the bust or statue. We give also translations of excerpts from two of the articles, as follows:

There are privileged souls, pure radiations of divinity, who write the history of a city, as noble sentiments write and govern the life of a man, bestowing upon all that light which is universal. And the noble mother-soul whom Santa Clara honors today with the spontaneous acclaim of a thousand grateful hearts is one of these souls chosen of God, set apart, an honor to humanity: a soul like that of the sublime Martyr of Golgotha, who gave His all for humanity's sake.

As Demosthenes wrote large his name upon Greek eloquence, and Cicero upon that of Rome: as poesy herself is oft named Virgil, Dante, or Victor Hugo; patriotism, Garibaldi, Daoiz, and Leonidas; terror, Torquemada; treachery, Fernando VII; the Castilian tongue, Cervantes; martyrdom, Jesus of Nazareth; democracy, Cayo Graco; and honor, Lucretia of old Rome, so today we write "La Caridad" (Charity) as synonymous with Marta Abreu.

Hail, noblest of matrons, an honor to your sex, a glory to your country! Better than upon marble tablets or even in books, is graven your name upon the hearts of a grateful people, who will transmit it, a precious legacy, from father to son, as a tribute to that religion which is higher than all dogmas, that religion which makes of all men doers of good deeds: the religion of *universal love*.

A land which boasts of sons and daughters of like nobility can never perish. Its future is assured, its greatness is written in the hearts of its children, and the God of Justice who alone possesses the key to these hearts willeth that the sun shall cease to light the worlds before works so meritorious shall fail of reward in gratitude. LUIS RONCORONI.

Charity, sacred word! Christianity's basic virtue! In the derivation of the word itself lies the essence of its meaning, for Charity cometh from the heart. The Latin *caritas*, itself derived from the Greek *χάρις* (*charis*), implies that Charity is the heart's most perfect fruit, for it means all that is born of goodness, affection, and love. Many indeed are the virtues treasured by humanity, but Charity is the mother of them all. And so plain is this: for Charity is virtue itself by antonomasia; it is the very heart; so high and pure is its character that it takes the name, even, of the center and fountain of our physical life. Where there is no charity there

Lomaland Photo. and Engraving Dept.

DOÑA MARTA ABREU DE ESTÉVEZ

LA gloria mayor que puede una mujer alcanzar en la tierra consiste en que el pueblo que la vió nacer, en vez de llamarla mi hija, la titule mi madre.

Rafael F. de Rojas

(Translation)

THE greatest glory that can come to any woman is that the city which gave her birth should say not *my daughter*, but *my mother*.

is no heart: for Charity is love of God, love for humankind, love of country, of family, of the home and its sacred life; it is love for that which perisheth not, love for the infinite, love for all that bears the sign and seal of Divinity. If blind faith be the virtue of ignorance and hope a mirage on the horizon of happiness, verily from our heart of heart do we write down Charity as the warmth and sunlight of life, ever seeking the good of all beings. There is none disinherited, saith Charity, and in blessed season doth she wipe away the tears of the poor, she supports wavering virtue, rouses to effort the discouraged soul of genius, and breathes unto the soul of a dying patriotism, courage and will.

If the saving of peoples is a work worthy of human effort such as we recognize in a Gaspar Melchor de Jovellanos, a George Washington, and a Simon Bolívar. Charity, such as that of L'Epée, San Vicente de Paul, and MARTA ABREU DE ESTÉVEZ,

Santa Clara's generous benefactress, is in its own way a labor of redemption. Time, in its predestined and dizzy march, will bring to pass the happenings of tomorrow, calm, smiling, radiant with purest beauty. Yet while all these will vanish, never will time blot out the memory of MARTA ABREU, that illustrious Cuban who is herself the living symbol of Charity, bestowing broadcast the blessing of her alms, the while, inspired by all that is good, she erects temples to art, founds asylums and opens schools, that the riches of intellect may be freely given to all who ask.

All that is beautiful, all that is good, all that is sublime, has its own appropriate symbol. Here we would symbolize Charity in the person of this woman, refined and queenly, wrapped in the holy vesture of purity. . . . Without Charity there can be no love; without love none of the celestial fortunes of the home with its deep-rooted happiness, neither the inspiration of patriotism nor that of philanthropy.

Blessed are the compassionate for theirs is the boon of the gentler emotions.

Blessed are those who give freely, for their hearts are nourished in the atmosphere of universal wellbeing.

Blessed are those who wipe away tears, who share with the widow and the orphan the sacred bread of tenderness and compassion, for to such is the kingdom of boundless gratitude.

M. F. LEDÓN

The above translations are but excerpts, as said, from two out of perhaps a hundred similar tributes offered to this loved benefactress, fair flowers from that fragrant garden which the heart-life of a grateful people always must be. All speak as spontaneously as birds awaken or roses bloom, and indeed in reading them over one loses sight of the printed page and sees only sweet blossoms of trust and tenderness, buds of purest gratitude and of compassion and a divine yearning to serve and suffer, if need be, likewise, for the greater good. In many of them, with all the poesy and charm that is innate in the Latin mind, is combined the robust thanksgiving and sternly appreciative qualities of the Teuton. Some of the lyrics and sonnets are literary gems — and all this from a people even then racked and tortured with the strain of a long war. If the finer qualities of literary craftsmanship and the aroma of soul-life — for what is gratitude but the soul's very voice? — cannot be wholly killed out under such conditions as those, what may we not expect of Cuba in the future?

If doubt existed in any mind at this late day as to the wisdom of Katherine Tingley in extending help to Cuba, first with material benefits and now with the bread of mental and soul-life, a cursory glance over the pages of this "Homenaje" were sufficient to dispel it. Her prophetic words uttered more than a decade ago come to the mind:

The Cubans have rare qualities, at present hidden because of the strain and unbalance in their lives and in the nation; but under proper conditions and with guidance, there could be developed a great love of the higher things of life, of art and music, of poetry and particularly of the higher drama. More than that, if the Cubans can once be given some insight into their own natures and can learn to work together harmoniously, they will show a gratitude that very few are capable of today in the deeper sense. For gratitude is one of the signs of soul-life.

It is easy to understand the eager welcome given to Mrs. Tingley by the enthusiastic Villaclareños. One who accompanied her on that journey said later that the very air seemed to whisper, "Behold, the materials are ready: let the architect appear." H.

OUR YOUNG FOLK

The Girlhood of H. P. Blavatsky

TO make a picture of Helena P. Blavatsky's girlhood, we must let our thoughts travel far away to the southern part of Russia, where, on the banks of the River Volga, in the province of Saratow, this part of her life was passed.

Helena Hahn was Madame Blavatsky's maiden name, and her father was a military man, Colonel Hahn. Her mother, whose name was also Helena and who was a well-known writer, died when her daughter was still very young. For a time little Helena stayed with her father, moving with him from post to post, but this military kind of life was hardly suitable for a little girl, and so she was sent to live with her grandparents at Saratow, where her grandfather was governor. She had here an English governess, a Swiss tutor, and a French governess, and for five years went on with her education.

The house in which they lived was very old and very, very large, in fact it is said to have looked much like a medieval castle; and around it was a park beyond which rose a dense forest. Here, among the moss-grown thickets, were Helena's favorite haunts, the loneliness of the place having no horrors for her, who never knew fear. Her grandmother was a profound student of natural history, and in the old house was a museum for which she had collected specimens of all kinds. This also was a favorite haunt of Helena's and she was soon on as familiar terms with all the minerals and the stuffed animals there as she was with the birds and trees in the forests. She used to say that each one told her his own story; for she insisted that every thing had a voice of its own and that she could hear it. What wonderful things she must have learned in this way! She would often be found, surrounded by hundreds of birds, laughing, and listening to the cooing or chirping sounds, and evidently as much at home with them as they were with her.

With her young companions Helena went on many an expedition collecting specimens, and great was the delight of the others when she would pick up some relic of the living things in the sea that long before had covered part of that region, and describe, just as if she saw it before her, the life at the seabottom. They listened to her entranced. It did not occur to them to wonder about her gifts as much as the older people did. Before they had seen her many times they all *knew* that Helena was entirely different from every one else; and all the marvelous stories she told them of what she saw they could not help believing, as a matter of course; for they had found out that she was nearer to Nature than any one else and that her eyes looked into Nature's realm and saw what others only feel dimly.

If there were anything Helena Hahn loved

HELENA PETROVNA BLAVATSKY

FROM THE WRITINGS OF H. P. BLAVATSKY

Be humble if thou wouldst attain to wisdom.

If thou wouldst reap sweet peace and rest, disciple, sow with the seeds of merit, the fields of future harvests.

Learn that no efforts, not the smallest—whether in right or wrong direction—can vanish from the world of causes.

Inaction in a deed of mercy becomes an action in a deadly sin.

Children should above all be taught self-reliance, love for all men, altruism, mutual charity.

Try to realize that progress is made step by step, and each step gained by heroic effort.

Thou shalt not let thy senses make a playground of thy mind.

The one terrible and only cause of the disturbance of harmony is selfishness in some form or other.

more than the birds and the trees it was the legends told her by the old people who had stored in their memories a wealth of such tales. All young people love legends; but they cannot see as she could, the inner meaning of every one, and the grain of wisdom there was in them for anyone who knew the value of them. A very wise old man, respected by all the people far and near, because of his knowledge of the healing powers of plants, was a special friend of hers; and he recognized that she was wonderfully near to Nature's heart, and said that she would be a great help to the whole world.

Indeed all who were associated with H. P.

Blavatsky when she was a young girl, felt that here was one whose eyes were open to more of life than other people's. It was no use for people to pretend or hide things when she was by. She saw everything; she knew the dual nature of everything and everyone. It was a fortunate thing for her that she belonged to a heroic and princely family who, ever since the time of Rurik, the first ruler of Russia, and one of H. P. B's ancestors, have been famous for their courage and their independence. This noble heredity helped her to be strong and fearless. She was not afraid to find out about everything, even if it made her sad and sorry for humanity. Perhaps she felt even then, when she was so young, that in her own heart was something which would help the world. From the very beginning of her life too, there had been a protecting influence over her, sometimes saving her just as some danger threatened; as when her horse bolted and she would have been thrown and hurt, had not some strong unseen power held her up. It must have been that seeing so much more than other people did, and feeling her life guided and protected, she came to have a *great trust* and that this grew in her heart until she was ready to be trained to be a Teacher and Helper.

Helena dearly loved her father, and you can imagine her delight when he took her with him to Paris and London, when she was fourteen years old. She had, of course, had music lessons, and she had learned to play so well on the piano that while they were in London she had lessons from one of the great musicians there and was recognized as a very talented pianist.

All through H. P. Blavatsky's girlhood, which, as you see, was passed in luxurious surroundings, and with every advantage of education and culture, she had a strong sympathy for people in poor circumstances or in a humbler station of life. She would often be found speaking with ragged children on the street. People said about her too, that her warm-heartedness and her affectionate ways made everybody know that evil feelings had no place in her. She never was resentful or unkind. She had the daring and the true nobility of nature that belong to a descendant of brave and high-born families. But her own mighty heart gave her the last touch of greatness that enabled her to grow out of her girlhood into the woman who brought a new hope to humanity by restoring Theosophy to the world.

A RĀJA YOGA STUDENT

If you speak of Theosophy, I answer that, as it has existed eternally, throughout the endless cycles and cycles of the Past, so it will ever exist throughout the infinitudes of the Future, because Theosophy is synonymous with Everlasting Truth.—H. P. Blavatsky, in *The Key to Theosophy*

THE CHILDREN'S HOUR

A Tribute to H. P. Blavatsky

It is early morning at Lomaland. The shadows are still long; only the tree-tops, hill-tops, the Academy and Temple domes, are flooded with golden sunlight. The ocean lies still, resting after the rumble of the night. The wild hills are clothed in their spring dresses of purple, gold, and white, and the least breeze carries their morning-greeting of herby fragrance.

A rabbit is sitting on his haunches and pricking up his ears, listening. What do you hear, little rabbit? What is coming? Happy voices are ringing over the hills, merry laughter, sound of running feet. Swift as the wind they are advancing. Ah! the Brownies are coming! Be still, and you will see what they are doing.

The wild daisies and buttercups are glad that they are awake. They and the Brownies certainly must understand each other, for whenever a flower stretches up its head and smiles, which means, "Take me," instantly is a Brownie there to take it in his hand. So the play goes on until one cannot tell which is Brownies or which blossoming hillocks. Then a call from the captain, and the whole band disappears as swiftly as it came.

We are watching from another corner. The Brownies are coming, loaded with wildflowers. The flowers are carefully packed in boxes; the big grey horses are stamping their feet, waiting to take them to the city of San Diego across the bay. The Brownies have disappeared.

It is night. The big Isis Theater is full of people from the city, and strangers from all parts of the world. They are listening to the beautiful teachings which Madame Blavatsky brought back to the world, and many hearts are filled with new hope.

And there — the flowers which the Brownies have gathered are smiling in the hands of every visitor in the big theater. They hold the sunshine of free nature; they hold the happiness of the little boys, the Râja Yoga "Brownies," who live close to its heart and whose play and delight, work, study, and plans for "when I grow up" are for making the world and its people happier, stronger, and truer in all that is light and good. They are a tribute to H. P. Blavatsky.

YLVA

A Letter to the Children for White Lotus Day

DEAR CHILDREN: None of you are too young to learn that May 8th is a day held sacred to Madame Blavatsky, the great Teacher of Humanity. It is called White Lotus Day.

"H. P. B.," as those who love her call her, came to tell the whole world about the Soul and Brotherhood. It will soon be thirty-five years since she came to America to begin her work. People had forgotten the teachings of wisdom, and had many wrong ideas about the Soul, and few wished to try to live Brotherhood. H. P. B. had to be very brave and very strong to go on teaching the truth, as so

Lomaland Photo. and Engraving Dept.

LOTUS BUDS IN LOMALAND

many enemies of Humanity tried to stop her.

The knowledge she came to bring back to the world is very old. H. P. B. had to search in many countries to find the sacred places where there are records of it. She had to be a student first, before she was a Teacher. She had to learn to understand languages much older than any the world knows of and the symbols she found in old, old, temples far away. Much of this ancient wisdom is expressed in texts or maxims, like the "quotations" read by the Lotus children. H. P. B. learned books full of these texts by heart; and when she became a Teacher she wrote down from memory a large number of them, and made a book of them. She called it *The Voice of the Silence*.

When H. P. B. did this, she did a great service for the whole world, but especially for the children; for in simple, beautiful words, not too long or hard for little folk, she gave the wonderful teachings of the Soul and Brotherhood.

A very wise thing for Lotus Buds and Blossoms to do, would be to learn by heart these golden sayings, to say them so often and so

earnestly that sometimes when there is a moment of temptation to be selfish or to give up trying, the words will ring in your ears and put you on guard again. How can any little boy or girl be content to think of himself or herself alone, and forget all about the happiness of others, if *To live to benefit mankind is the first step* has been learned and taken into the heart? Besides, if you cannot quite make up your mind whether to wish to have everything for yourself, or share with someone else, there is *Step out of sunlight into shade to make more room for others*, to remind you; and *Sow kindly acts and thou shalt reap their fruition*. Then there is *The way to final freedom is within thyself*, to point you to the divinity within; and *Guard thou the lower lest it soil the higher*, to warn you to be vigilant always, because though you are a Soul, you have a lower nature to conquer. *Strive with thy thoughts unclean before they overpower thee* will help you to keep from having the wrong thoughts that lead to naughty deeds. These golden words are living; take them into your hearts, as H. P. B. did, and you will learn to serve Humanity. G.

A Theory of Gravitation

THERE is a long article in the *English Mechanic*, in which the writer attempts an explanation of the gravitational force. He regards the luminiferous ether as being the agent by which this force is transmitted throughout space and brought to bear upon matter; but, so far as can be made out, he does not indicate the origin of the force thus transmitted by the ether. Hence, if we accept his hypothesis, we have still to answer this question. He imagines that the ether may have longitudinal vibrations, apart from and independent of its transverse and light-carrying vibrations, and that it is by these longitudinal vibrations that the gravitational force is conveyed through space. Regarding all the terrestrial matter in its totality as a sphere, he suggests that the vibration transmitted by the ether may exercise a compressive effect on that sphere, thus driving its parts together.

There have been many theories more or less like this, and some of them are mentioned by the writer. One is that of Le Sage, who imagined space filled with rushing particles which impinged on matter and pushed it; two bodies near to each other would shelter each other on the leeward side and so the impulse on the other sides would preponderate and drive them together.

In the introduction the writer says that if we deny "action at a distance," we must accept the only alternative—that the exercise of force must come through "actual contact." One must be pardoned for pausing to ask What is "actual contact"? It is a thing of which the usual atomic theories provide us with no conception; since, according to them, no two particles can ever come into contact. In fact it has been shown over and over again by logical reasoners who have argued from the data provided them by scientists themselves, that a push is as difficult to explain as a pull, and that action at a distance, however inexplicable and untenable, is nevertheless the only kind of action possible according to physical theories. Let the reader consult *Concepts of Modern Physics*, by Stallo,

Action in Distance a Necessary Conclusion

or refer to the quotations from Stallo, Butlerof, and other critics of modern physics, in *The Secret Doctrine*, by H. P. Blavatsky.

As has been so frequently pointed out, it is absurd to make so much fuss about gravitation in particular, as though it were a special case and something more than ordinarily puzzling and inexplicable. The phenomena of

gravitation present one case of attraction; but there are many other cases of attraction, all equally inexplicable. There are electric attractions, magnetic attractions, molecular attractions, etc. We cannot provide a satisfactory dynamical explanation of any of them, for the fundamental difficulty of explaining the transmission of force through substances stated to be composed of isolated particles is the same in every case. In gravitation we have the phenomena of the physical and chemical laboratories repeated on a larger scale. As atoms attract each other and cohere and react on each other in the test-tube, so do larger bodies behave on the surface of the earth, and still larger bodies in planetary space.

Gravitation a Phenomenon of Attraction

A stick is, according to the current hypothesis, a row of particles, isolated from each other; yet, if one end be pushed, the whole stick moves. To explain this, we postulate an ether, and the same difficulty recurs as to the constitution of this ether; for, if we attempt to evade it by making this ether "continuous" or unparticled, we are met with the same objections as originally forbade us to imagine physical matter to be continuous and unparticled—the kinetic properties assigned to the ether can not be accounted for on such a hypothesis as to its constitution; a continuous medium can not exhibit any dynamical properties such as we are constrained to assign to it.

The only way out of this fundamental difficulty is to bear in mind that physical space is, as it were, only a thought-form—a projection (to borrow a term from practical geometry), which represents in a distorted and imperfect manner the reality behind, as a picture thrown on the screen of our five sense consciousness. We can no more obtain a perfect representation of the truth under such a limitation than we can draw a perfect map of the earth on a flat sheet of paper.

To take another illustration. When we view the universe from this standpoint, it is as though we were watching the building of a house by architects emitting only ultra-violet rays and consequently invisible to us. Imagine the hypotheses we should invent to account for the facts, and you will have an analogy with the hypotheses devised to account for physical facts. The bricks move; what moves them? Is it a force inherent in the bricks themselves, or are the bricks surrounded by an invisible ether which propels them?

Everywhere in the universe we perceive Life, appearing under two main aspects according to the way we look at it—motion and

matter. The nearest physical conception to that of life is what is called "energy," which is regarded as a product of matter (or mass) and motion; but we have to assume both the mass and the motion. We find this energy everywhere; its origin we can not determine. The only case

Conscious Life-
Force Underlies
All Action

in which we can trace an origin for energy is that of our own organism; here we see energy coming forth as a consequence of *thought*. Inferentially the same process takes place in the animal kingdom; and why not also in the vegetable and mineral kingdoms?

The only road to knowledge is the old one recognized by ancient wisdom—that of refining the faculties by which the mind perceives, and of using higher faculties than the physical senses. Thus we might come to know that physical "space" is like an image on a screen, in which the effects appear but not the causes; and that the reality lies behind the screen, where, to our physical senses, all is darkness. But that darkness is not impenetrable; like the chrysalis in the old symbol, we can hatch out to a higher life, when we have outgrown the limitations which error and desire impose upon our faculties. Only let the

ambitious remember that no man enters that domain without the passport of *purity*; failing this, his rash attempt lands him in backwaters of delusion and error worse than those from which he sought to escape—as has been so frequently illustrated in the case of those who have tried to make Theosophy subservient to personal ends. STUDENT

The Seven Races

THE *Nineteenth Century and After* contains a long account of the famous lake of Nemi in Italy, famous for its beauty, for the galleys of Caligula still lying at the bottom of its clear waters, and for the neighboring grove and temple of Diana.

In 1885 Lord Savile began excavations in the grove and at once was rewarded by abundant finds, chiefly bronze and *terra cotta* votive offerings to the goddess. Says Mr. St. Clair Baddely's account:

In some other openings, however, but little removed from this first excavation, were found remains of several *male* terra cotta statuettes. . . . One thing was evident, these could have had nothing to do with the essentially feminine cult of Diana Taurica. One of these figures wears round his chest a thong, or fascia, such as were worn by charioteers. With these was found a fine votive vase, upon the body, or bowl, of which is represented, in full action, a horse race, with the "meta" (or goal) and the "ova" (eggs) representing the customary seven rounds of the circus race. Further (and that is an interesting point), four of the "ova" are displayed fallen, showing that three more rounds of the race have yet to be run. The riders are nude, and two griffons (for Nemesis) are seen seizing a stumbling horse, and tearing it. But what would such a vase be doing in the precincts of Diana? How can we explain the presence of these distinctly masculine offerings within a precinct peculiarly sacred to a feminine cult?

Another divinity, a male one, was worshiped at this place, Virbius, to whom the oak and mistletoe were sacred.

Now considering that in several ancient systems the moon was sometimes *male*, and that the mistletoe is a lunar plant getting its life from the solar oak, it seems possible that

Virbius was the male aspect of the moon, who, as such, was the life-giver to humanity.

The molding on the vase is extremely suggestive. According to Theosophy, man lives on earth through seven great races successively. Of these our Aryan is the fifth, the Atlantean being the fourth and the Lemurian the third. Four of these "rounds" in the great "race" are run, symbolized by the four eggs that have fallen; one, our own, is in progress; two remain to follow. Nemesis, Karma, is destroying a fallen *subrace*, one of the many of which every great race consists, "falling" one after another as the new one begins to show its first types.

In Theosophical terminology, Virbius may symbolize *prâna*, the vital essence, solar, working upon the physical body through the "lunar" astral essence and hence in this bit of symbolism the *male* moon. STUDENT

The Garbled Gospels

A RECENT book, *The Teaching of Jesus About the Future*, by Professor Sharman, of the University of Chicago Divinity School, already noticed in these pages, is exciting much interest. One paper says:

Professor Sharman, in an exhaustive consideration of the Gospels of Matthew, Mark, and Luke, reduces much of the contents of these books to what he considers garbled reports of Christ's sayings, false interpretations of Christ's views by outside influences, false messages concerning future life and future punishment and unauthentic tales of Christ's life. He casts doubt on the chief tenets of the orthodox church, which he regards as the products of wrong interpretation of the New Testament.

That Jesus did not preach the doctrine of "heaven" and "hell" and the "day of judgment," and did not commission His disciples to preach the gospel are among the professor's assertions. He divides the material of synoptic gospels into "what Jesus probably said," "what the earliest editors of the gospels thought He said, or would like to represent Him as saying," and "what later editors thought it best to represent Him as saying."

Christians should reflect upon these points; for it is incumbent upon everybody in this advancing age to reflect. The representative classes of modern culture have now outgrown the notion that man is a delicate nursling of the Almighty, to be fed on easy cut-and-dried doctrines that require no exercise of the faculties. They have come round to the view that man is actually himself endowed with Divine faculties to discern the true from the false, and that it is his *duty*, and his *necessity*, to use them. In these Gospels are found many teachings which appeal at once to our innate sense of right, as being both true and practicable. It matters not who said them; they are the words of a Master; they form part and parcel of a universal and eternal gospel. If our mere intellect cannot always discern the true from the false, we have enough teaching to enable us to set our footsteps on the path that leads to enlightenment. We all understand what is meant by the life of purity and unselfishness; and we are taught that a following of it will lead to an awakening of the Soul's eyes so that we may discern the truth. This will give us enough to do for the present. All of value in the teachings of Jesus are found almost verbatim in much older teachings; while the "miraculous" and other events surrounding the story are faithful echoes from the life of other sages of earlier times in the world's history. STUDENT

Relic-Hunting and Vandalism

THE Mexican Government has taken active steps to prevent further despoliation of her archaeological treasures by relic-hunting Americans; and orders have been issued to border customs officials to prevent such articles from leaving the country. This action seems well-timed.

The *Journal* of the American Asiatic Association published a letter from a correspondent in Peking, saying that since 1906 a great increase in vandalism has taken place in China, especially North China. Some of the most celebrated and valuable monuments are threatened with destruction. At the Ming Tombs, north of Peking, the statues in the famous avenue of stone images have been defaced, and depredations of carvings, etc., by visitors are increasing. In 1907 a foreigner, otherwise respected (says the letter), financed an expedition to Sian-fu in the province of Shensi, and the head of the expedition afterwards asserted that its primary object was to filch the Nestorian tablet and carry it away by river; but the object was frustrated. Recently one of the government boards called the attention of the throne to foreign vandalism in the Temple of Heaven enclosure at Peking; and about the same time the depredations of foreigners caused the temple Ta-Kao-K'ien in Peking to be closed to visitors. The destruction of the carvings around the base of the famous marble tope in the Yellow Temple, begun before 1900, has continued. Other instances are given, and the increase of railway communication is held to have increased the acts of destruction.

The instinct to pillage and destroy still lingers in the blood of the descendants of barbarian hordes, covered over with the varnish of civilization. This fact may help us to define the difference between different kinds of civilization—the kind that purifies and the kind that merely lacquers. According to one sense of the word, the Indian who said, "Goods plenty safe; no white man in a hundred miles of here," was more civilized than the owners of the goods.

We have to bear in mind that the people of our civilization are not yet fit to use liberty properly; and though no one desires a return of parental government or restrictive despotism, there needs to be some kind of government. That government must be evolved from the people themselves, and will come about when there is sufficient unanimity and union among the good to coerce the evil; in other words, when the public conscience has become able to manifest itself as a corporate organism.

Mixed with the desire to possess and the desire to gratify vanity is the instinctive veneration for antiques, by which we recognize dimly and intuitively that such objects carry with them an influence from the past. But the instinct is not sure enough to escape deception; and there is in various parts of the world quite a thriving business in the manufacture of spurious antiques wherewith the relic-hunters may gratify their instincts.

Were there true international co-operation among archaeological societies, and a deeper respect for the immense antiquity of *civilized* man, there would be far less destruction of old records, and a door might open. H. T. E.

Some Views on XXth Century Problems

The Planes of Consciousness

IN the very last system of philosophy, *A Theory of Mind*, by Professor John Lewis Marsh, mind and matter are once more viewed as one. But it is matter which is mind. "Matter to itself is mind; mind as it reveals itself to another mind is matter." An atom is really a little speck or monad of mind; seeing it from outside it, you regard it as matter. It, to itself, is mind. This little mind is of course very rudimentary, chiefly an impulse to combine with others or another. When it has so combined and a molecule results, the new mind which results from the fusion is not only more complex than the mind of the atomic unit but different in quality, just as water is different from the oxygen and hydrogen which combined to compose it. Molecules unite into cells, again resulting in a higher order of mind; these into organs with a still higher result; these into a body such as that of man or an animal, now possessing the highest synthetic consciousness. This is the "body-mind," made up of, but different from, the minds of all the millions of millions of atoms that go to it. It is supposed to be the human mind, is credited with having evolved this conception, and, we presume, with adverse criticisms of the same.

But it is only a part of the field of human consciousness. Suppose a musician who lived over a musical instrument factory, were to descend to the workshops. He has been composing and his inner ear is filled with his born and nascent harmonies.

Multitudes of men are at work upon various kinds of instruments, many of them trying the tone of those they have completed. In the din the composer instantly loses all hearing of the fine sound within him, and moreover his interest is soon entirely absorbed in the work of the men. They are separate men with separate minds, but the small groups concerned with each instrument are to that extent unified and thinking together. And the whole lot are also unified as workers in one factory, to that extent with a similar interest in its working, to that extent again of one mind.

The musician comes to share the interest of each group in its instrument, and of the whole in their common welfare as resting on the welfare of the entire factory.

Your philosopher will now observe the aggregation of the men and the absorption of the musician in their work, and he will theorize that the consciousness of the musician is *made up* of the consciousness of the men. He does not note that at any moment the musician may detach himself and become a spectator; that he may then *guide* the men and so control their work as to cause them to make the instruments he wants for the expression of the inner harmony which he has again begun to hear; that he may even train them to play it on the completed instruments.

In all this the elements are: the self or ego of the musician; and *two* minds both of which he can guide and of the contents of both of which he is spectator. Clothed with the higher, full of its harmonies, he descends

into (incarnates in) the material factory (the body) full of activities, noises, groups (organs), and single entities (cells). Assimilating all this and interesting himself therein, it gives rise to or becomes another mind. It is *this* mind, the animal or body-mind, that the philosophy in question alone considers. Of the higher mind it makes no account; of the self none; nor of that super-region of the self, its absolutely subjective meta-consciousness, a little of which finds semi-objective expression in the inner harmonies born at the creative moments. Theosophy is the philosophy of all these planes of being in their interaction, both human and cosmic.

STUDENT

The Tide of Insanity

ILLINOIS is not unnaturally getting worried about its insane. The biennial report of the board of charities is just out, comparing the numbers of insane today with those of thirty years ago. Since 1878 the population has increased 89 per cent.; the insane have increased 369 per cent. There are now 12,000 persons in the asylums; there were but 2500. The proportion of insane was but one in 1152; it is now one in 465.

Now must it be supposed from this that the other 464 are absolutely sane? There is no such line as that. The figures mean that the whole population is about three times less sane than it was; that there are only one-third as many absolutely sane people. The point comes home to every average individual: that he is three times as liable to an insane delusion as his father, that his present view of the world and of life is correspondingly less valid than his father's.

The situation is of course peculiar neither to Illinois nor to America.

Inviting the reader to assure himself that he at least is one of the remaining absolutely sane ones, we can invite him also to consider the case of the less fortunate average. When an idea comes up into their minds they are less able than he to pass judgment upon it; even when they *have* passed adverse judgment upon it, decided that it is erroneous or foolish, they are less able than he to *expel* it, more liable than he to be finally conquered by it, compelled to accept it and act upon it. Is not that what insanity means, failure of judgment, or overwhelming of it, inability to control the mind?

The root of the trouble is in an education which does not educate. Education in its highest sense is a leading forth of the soul that there may be judgment passed (by it) upon every thought, every intended act, every mental and physical tendency. But if the child is not made to feel itself a soul-ego, capable of standing apart, of looking on, and of ruling: then its state of consciousness is one with the mind; every thought, every impulse, appears to come from itself, to be itself, therefore not judged or ruled, instinctively permitted and acted upon.

Now consider what this non-criticism of thoughts and impulses by an ego self-held sep-

arate, comes to in extreme cases. For everything moderately present or absent in the average man is extremely and overwhelmingly present or absent in a few, in this case the insane.

Permitted — because not criticized — ideas grow in strength and number. The idea, for instance, that people smile a little or look unfriendly as one passes along the street, becomes the insane delusion of a general conspiracy. Couple this in the same case with that *slavery* to the prevailing mood which develops at last out of the life-long permission of any mood that happened to be coloring the day or hour; and, if this mood now happens to be despondency, the "conspiracy" will be evaded by suicide; if rage, by murder.

The education which will put an end to insanity is that which calls out soul-consciousness, spiritual egotism, as eternal critic and guide of action, thought and feeling. Then soul, instead of impulse, becomes the originator of every act.

STUDENT

Natural Design

THE old question, *Is there design in nature?* for a long time lapsed, seems to have suddenly taken a more fruitful shape — *What is the design of or in nature?*

A philosophic writer, Mr. T. W. Rolleston, in *Parallel Paths*, answers it in two words, *more life*, that there may be more life. Considering protoplasm, he sees that the essential of its life is response to stimulus. Deeper, this response to the external rests on an inner response to "the life impulse," "the vital force." This life impulse, life itself, wants to be more, more in intensity, in complexity, in quantity. This is the open secret of the motive force in evolution. In man too it is at work; it becomes in him the impulse to be, do, know, become.

From here the writer tries to develop an ethical aspect.

Right action in itself is simply the action which best subserves the central purpose of nature. . . . Nature does not directly want pleasure at all, but is resolved, at the cost of pleasure and everything else, to have life. . . . The ultimate question as regards the abstract morality of any act or class of acts must be, Does it make for life?

But nothing ethical will be gotten out of this question unless man is recognized to have another life than the physical or the mental. He must amass, while in the body, a sort of life that will still be his when the body is gone. If he has lived only mentally and physically, he will have done none of that amassing. He has begun to amass when he has found in his heart something higher than mind, and begins to work with that. He has begun to amass when he has found that the spirit of brotherhood gives life to him who has it as well as to him who receives of its acts. If man elects to live permanently by the *animal* law of struggle, he must die by it, no more of him surviving than survives of the animal. If he stands in close to his really *human* nature and becomes a ceaseless benefactor, he is co-worker with nature and has all her immortality individualized in himself.

The Truckee Rocking Stone

THE famous Truckee Rocking Stone, illustrated herewith, is of great interest to Americans, not merely as a curious sight, but as an evidence of the races of men from whom they have inherited the land. For there can be no doubt that this curiosity is of human origin. The subject was discussed in some articles and correspondence in the *Truckee Republican*, April, 1893 which are referred to in the description and remarks following.

The stone stands on the brow of the hill overlooking the Truckee Basin. The rock which forms the base is 30 feet high on the lower side, and 15 on the upper; the top is almost a true circle, about 20 feet in diameter; it is nearly level and has been hewn off across the grain, as may be seen from the cracks in the sides. The Rocking Stone is poised exactly in the center of this circular floor; it is 7 feet long, 6 wide, and 5 high, and is estimated to weigh 16 tons. It rests in perfect equipoise upon two points, and a six-year-old child can rock it.

In discussing its origin let it be freely admitted that there are certain perched blocks and erratic boulders due to glacial action and to weathering. But at the same time, let us guard against the argument that because some blocks are natural, therefore all are natural. There are in fact two kinds, the differences between which are so marked as to make it as sure that the one kind was not made by natural agencies as that the other was. It will be shown that the Truckee Stone belongs to the former class.

The writer in the *Republican* takes for comparison an example of the latter class (as it is deemed) — the Congo Stone. This was found by engineers surveying for the Congo Railroad. It bore a striking resemblance to those found in France and England, used as altars by the Druids, but made by their predecessors; but an eminent geologist concluded it could not be a dolmen. We have no proof, said he, of the existence, among the people of the Lower Congo or their ancestors, of a civilization equal to the erection of dolmens. Moreover there are in this part of West Africa a number of tottering rocks which, as they are composed partly of soft mica schist and partly of hard quartz and gneiss, may well have been caused by unequal erosion. Students of Theosophy, however, will be ready to admit the possibility of dolmen-builders, even in Africa.

But the Truckee Stone comes under a different head. It is a solid granite boulder and shows no signs of weathering, being well preserved and uncracked. There is the theory that it was deposited by a glacier. But the lower stone shows no signs of glacial action. If it had been smoothed off by a glacier, it ought to be quite smooth and grooved with the familiar parallel striations; but it is rough and not perfectly level. If we ask whether the glaciation was so long ago that the marks have been obliterated by weathering, the answer is that in the center stands the rocking stone, which would have protected the part beneath it from such weathering; whereas the part beneath is in the same condition as the rest. Moreover the country round shows no trace indicating that a glacier could have come anywhere near. Nor could an avalanche have deposited it, for there is no mountain from which the avalanche could have come; and there could have been no mountain if the alleged glacier had been sweeping over the site. In short, no combination of natural forces could have accomplished the double marvel of smoothing off the lower stone across the grain, and on it depositing in perfect poise the other granite boulder.

On the other hand the Truckee Stone resembles the European rocking stones, used by the Druids for religious purposes (as is said). Two points come

Lomaland Photo. and Engraving Dept.

THE TRUCKEE ROCKING STONE, CALIFORNIA

up in connexion with this. One is the existence of giants who erected these monuments; the other is the magical properties attributed to stones in ancient science. The writer in the *Republican* has evidently read *The Secret Doctrine*, by H. P. Blavatsky, to some purpose, for he quotes both from her and from the authors whom she quotes. H. P. Blavatsky brings forward a great deal of evidence for the existence of these giants, and the huge stones form one item of this evidence. In France there are whole forests of them, of colossal size, set up in mathematical positions. Most of them are the relics of the last Atlanteans. Enormous blocks of granite strewn over Southern Russia and Siberia lie where there are no mountains nor rocks, and must have been brought immense distances and with prodigious efforts. Some of the stones of Stonehenge, according to Flinders Petrie, have been brought from a distance, probably the North of Ireland. Every race has traditions about these giants. We find them in our Bible. The Greeks had a similar story about the war between the Titans and the Olympians. All these giants of ancient tradition were the Lemurians, Atlanteans, or the early Fifth Race.

With respect to the Truckee Stone in particular, we have the giant fossil footprints of Carson, Nevada (see *CENTURY PATH*, vol. xi, no. 2); and the writer surmises that the stone was erected by the same giants.

As for the purposes of such stone erections, modern science is lost in a maze of conjectures, being able to imagine only purposes familiar to modern experience, such as sepulture, temples, and fortification. Some have been found to have an astronomical bearing. But the great Races preceding our own Fifth Race had passed through all their seven cycles, and were therefore further advanced in science than we are as yet. So it is difficult to say what may have been the purposes for which the stones were used. Much information is given in *The Secret Doctrine* about magic stones, some of which the writer quotes. There were serpent-stones, star-stones, animated stones and speaking stones. But this belongs to a branch of science not yet re-discovered by our civilization; therefore it will doubtless be scoffed at until more

is found out. The *Republican* quotes H. P. Blavatsky as follows:

The rocking, or Logan, stones bear various names. The Celts had their *clacha-brath*, the "Destiny or judgment-stone"; the *divining-stone*, or "stone of the ordeal" and the oracle stone; the moving or animated stone of the Phoenicians; the rumbling stone of the Irish. Brittany has its "*pierres branlantes*" at Huelgoat. They are found in the Old and the New Worlds: in the British Islands, France, Spain, Italy, Russia, Germany, etc., as in North America. . . . Pliny speaks of several in Asia. . . . and Apollonius Rhodius expatiates on the rocking stones, and says that they are "stones placed on the apex of a tumulus, and so sensitive as to be movable by the mind" — referring no doubt to the ancient priests who moved such stones by will-power and from a distance. (*The Secret Doctrine*, II, 342)

STUDENT

Modern Cave-Dwellers

IN connexion with the theory that cave-dwelling indicates a certain primitive stage in the history of mankind, the *CENTURY PATH* has often remarked that the existence of cave-dwellers at a given time and place does not prove that there was no civilization there at that time. Cave-dwelling goes on at the present day in the midst of civilization. The modern troglodytes of the volcanic tracts in Asia Minor have been described; there are also cave-dwellers in France — no fewer than 2,000,000 of them, says a traveler. North, south, east, and west are found these imitations of the homes of "primitive man." They stretch for 70 miles along the valley of the Loire, from Blois to Saumur. The occupiers are well-to-do peasants, perhaps owners of the neighboring vineyards; and the interiors are clean and well furnished, cool in summer, easily warmed in winter. These dwellings were made incidentally in the quarrying of stone for building. Now let us try to imagine what some archaeologist of the future might say on discovering them, at a date when all the comfortable furniture would have decayed and only the bones and oyster-shells be left. Were the so-called primitive cave-dwellers well-to-do peasants in the midst of civilization? STUDENT

The Trend of Twentieth Century Science

The Law that Failed

DR. JOHN TORREY has recently been trying to encourage us. He gives reasons for supposing that during, say, the seventeenth and eighteenth centuries, the death-rate was anywhere between fifty and eighty per thousand. Now, even in great cities like London and New York, it is at most nineteen.

This great decrease he attributes to the protection against infectious diseases which we now afford to children under five years of age. He does not suggest that it is due to increase in vitality.

We now turn to biology and the law of survival of the fittest. There we learn that in the animal world when certain conditions have existed a long time, an adaptation to them is reached, those individuals that cannot adapt themselves being weeded out. The conditions surrounding the *human* animal for many many centuries were, among others, the bacteria to which the infectious diseases are due. By the high death-rate of those centuries, that is, by the weeding out of individuals that could not withstand the bacteria, the survivors should at last have reached immunity. But that they have not done so is proved by the low death-rate itself, since its lowness is due to the protection which we have found it necessary to give, and have learned how to give, to the children. How about that biological law? If it be true for the human animal, why are the children not by this time immune? And are we not doing the race an injury by protecting them and thus hindering the law?

Since it has evidently failed to work in the case of the human animal: Why? Does it not not look as if there had been a steadily lowering standard of vitality, a faster lowering than the eliminating process could keep up with?

In practice we neglect the law, and we are perfectly right in doing so. It will take care of itself. Our business is to protect, and to look for, the leakage of vitality. Under the head of protection come the ordinary laws of hygiene. The search for the leak is for the individuals to undertake, searching in their own lives for the ways in which they waste vitality and allow their children to do so. The digestion of a pound of candy is a waste; the digestion of an unnecessary ounce of food is a waste. A bad temper is a chronic waste. Discontent and ambition are wastes. We need to create ourselves into health and sustain ourselves there; yet we are nearly bankrupt of the creative and sustaining essence that ought to be available. STUDENT

The Lessons of Helium

HOW long is it since the sedimentary rocks began to be deposited? This is another way of asking how long there has been organic life upon the earth. The scientific answers cover an extraordinary range. They have run as high as five hundred million. But their progressive tendency is to be less and less; finally we had Professor Sollas', which allowed no more than twenty million.

Professor Strutt has gone about the work

in a new way. Taking the last discovery of the new chemistry as his basis—that the element helium is the final product of radioactive changes—he thinks that the amount of that element in any given rock will be a measure of that rock's age. Selecting samples of a number of rocks of different ages, all containing uranium (the ancestor of helium by way of radium and some other intermediaries) he estimated the relative proportions of grandchild and grandsire, of helium and uranium. The larger the proportion of the first to the second, the older the rock.

Thus calculating, he gets 225,000 years for the late Tertiary; 3,080,000 for the upper Cretaceous of the Secondary; and 141,000,000 for the upper Carboniferous of the Primary. It will be remembered that geology counts five successive periods: Primordial, Primary, Secondary, Tertiary and Quaternary.

In these last figures he is very close to those given by Theosophy. Theosophy reckons 320,000,000 years since the beginnings of sedimentation. Of this period 170,000,000 are assigned to the Primordial period; about 103,000,000 to the Primary; 37,000,000 to the Secondary; 7,000,000 to the Tertiary; and about a million and a half since. Adding together the periods of the *whole* of the Primary, Secondary, Tertiary and later, we get about 148,000,000 millions—not far from Professor Strutt's 141,000,000, especially as in this reckoning he does not include the first part of the Primary. The upper green sand of the Cretaceous, deposited at the very end of the Secondary period, would be according to Theosophy at the least 9 millions of years old; Professor Strutt gives but 3. While his 225,000 for the English Pliocene or late Tertiary, Theosophy will multiply by at any rate six or seven.

But if he will run his line backward from the beginning of his 141,000,000 through the lower Primary into and through the depths of the Primordial, he will find himself, by his own method of reckoning, very close to the total given by Theosophy. STUDENT

The Heat of the Crust

PROFESSOR JOLY'S studies of the Simplon and St. Gothard tunnels certainly support the suggestion that radium is the (or a) cause of the crustal heat.

In sinking shafts it is found, as everybody knows, that the temperature increases with the depth. But the increase is not always the same. And it varied very much at different parts of these two tunnels.

For a length of some seven or eight kilometers the Simplon tunnel lies at a depth of about 1700 meters. At the north end of this stretch the temperature was 55 degrees; at the south end, owing to the cooling effect of water circulation, it was 35. The northern temperature corresponds to a degree for every 31 meters of depth.

The temperature of the central part of the St. Gothard tunnel corresponds to an advance of one degree for every 46 meters of depth; the temperature of its northern end to an ad-

vance of one degree for no more than 20 meters. The southern end, as in the case of the Simplon, was confused as to this issue by the presence of water.

We have then three rapidities with which the temperature advanced with depth: a degree for 20 meters, for 31, and for 46. The amount of radium in the rock bore a clear though not exact relation to this. The mean for the northern end of the St. Gothard tunnel, where advance was swiftest, was 7.7 billionths of a gram of radium per gram of rock; the mean for the Simplon tunnel was 7.1 billionths of a gram; for the central part of the St. Gothard was 3.3 billionths.

The correspondence is very suggestive. The difference between the 3.3 and the 7.1 and 7.7 is very marked. Some other details in Professor Joly's paper, which we have omitted, make it a little less so; but the general relation is quite clear. Should it be finally demonstrated that the whole heat of the crust can be accounted for, as has been already surmised, by the presence of radium, geology will have to do a great deal of reconsideration—and so will astronomy. STUDENT

The Shrinkage of the Back Garden

YOUR back garden may not seem to you to have shrunk much in size during the last couple of thousand years, but there is some evidence that it has actually done so. It is an integral part of the earth's crust, and of course you will not expect that it shall be shown any favoritism and allowed to escape the general law of crustal contraction.

Prometheus reminds us that eight years ago Loerkins got together all the measurements of the earth's quadrant, deduced from the measurement of a degree of latitude, which have been made from antiquity up to now. Here is the list, with the date, the measurer, and his measurement:

	METERS
230 B.C. Eratosthenes	11,562,500
80 B.C. Posidonius	11,100,000
827 A.D. Almanon	10,360,000
1525 A.D. Fernel	10,010,800
1633 A.D. Norwood	10,050,000
1645 A.D. Grimaldi	10,989,642
1669 A.D. Picard	10,009,081
1719 A.D. Muschenbroeck	10,004,000
1792 A.D. Delambre	10,003,248
1801 A.D. Swanberg	10,000,157

The diminution is thus practically progressive and underneath possible small mistakes we can discern the fact for certain. But we need not bother about the back garden, even if we have decided to return to it for the next ten thousand incarnations until the flowers have learned to talk to us and we to understand their talk. We may not assume that a contraction of a million and a half of meters in two thousand years past will mean an equal contraction in the next two thousand. For all we know it may come to be less and less, may perhaps be replaced by a rhythmic expansion. We may finally learn that the earth is or has a heart, with a regular systole and diastole. After all, two thousand years is a very short space of time. C.

Nature

Studies

Going Back to Nature

A PAPER reports the case of a child who was reared in the open air. The adoptive father never allowed it to wear flannel, let it romp in the grass without any clothing in nearly every kind of weather, forbade the use of a hat, and fed it scientifically, with wonderful results.

There is probably little doubt among any people that outdoor life is conducive to robust health and that the wearing of too much clothing is responsible for a good deal of ill health. Peoples that live in the open air are remarkable for hale complexion, bright eyes, and other signs of luxuriant vigor. The adoption of civilized clothing gives consumption to aboriginals. The conditions of civilized life do not allow of proper activity of the skin, proper aeration and elimination, proper communication with the life-currents of Nature; and they breed tenderness and susceptibility.

Perhaps that great and important institution known as "Bed" is responsible for a paramount share of ill-health. Oriental and ancient nations have not and did not have this institution. They merely went to sleep. The luxurious Romans thought that a mere alcove in the side walls of their spacious halls was good enough to sleep in. The complex machinery of sheets and blankets is quite a civilized invention. Sleeping on a mat would probably be more conducive to health; and, if in an airy tent or the open air, so much the better.

But the demands of civilized life are so great, and our individual lives are so interwoven with the life of the whole civilized community that we cannot do much in this line without an invidious prominence as well as an upsetting of general arrangements and conveniences. There are certain marked conditions in our character and aims as a race at this particular stage of our evolution that have made civilized life, with its attendant advantages and drawbacks, desirable and inevitable. What are these?

The answer is that Man has other needs besides those of his physical body, and that these could only be met by a civilized life. What sends the peasant to the towns? It is that he finds in the towns more to his present requirements than he found in the country. The pure air and natural surroundings are of little use to him. And why? Because he is not sufficiently developed in the higher parts of his nature to profit by them. And so he goes to the towns to develop his intelligence and gain new experiences, albeit at the ex-

PONTAMMAN, AMMANFORD, WALES

MAY

THEN came fair May, the fairest maid on ground,
Deck'd all with dainties of her season's pride,
And throwing flowers out of her lap around
Upon two brethren's shoulders she did ride,
The Twins of Leda; which on either side
Supported her like to their sovereign queen:
Lord! how all creatures laugh'd when her they spied,
And leap'd and danc'd as they had ravish'd been!
And Cupid self about her flutter'd all in green.

Chaucer

pense of his physical and hygienic advantages.

It is a pity that Man has not been able so far to develop himself intellectually and culturally without gaining these advantages at the expense of the hygienic advantages; but, so long as we are imperfect and cannot have everything, we must be content to have one thing at a time.

For Man to go back to a natural life before he has reached a certain necessary stage in his civilized development would amount to a retrograde step and turn him into a rustic or gipsy. His exuberant health would not be an unmixed blessing to him, for he could make no more use of it than a gipsy or a boor does. He might be robust and healthy, but at the same time ignorant and clownish.

We cannot therefore go to Nature in the sense of going *backwards* to it. This is proved, apart from theory, by the result of experiments in that direction. Who has not read of "colonies" and "communities" and seen pictures of men and women walking barefoot in the grass, with long hair and loose white robes? And how many desire to imitate them? True, we might avoid the grotesque and merely retire to woodland seclusion with Thoreau; but, like him, we should probably need a civilized public for audience. And, though of course a period of woodland solitude may well occur as a necessary and

destined phase in the evolution of some particular individual life-history, such a retirement, if practised generally, would at best result in a deviation from the line of march and a temporary loss of our opportunities.

No; we must look forward, *through* the present kind of civilization, to a stage beyond it, which, though more natural shall not be the less civilized but the more civilized. Man must have grown so strong that he can dominate Nature, instead of being passive to it. He must rather tame it than let it make him wild. Moreover he must give up drawing that sharp contrast between Art and Nature, by making his art more natural and rendering himself more a part

of Nature. For Man is one of the creative influences at work in the world, and Nature is the work of other creative influences. Therefore what Man does may be considered as natural, in so far as *he* is natural—that is, in so far as he obeys the laws of harmony and does not use his will selfishly to produce inharmonious effects.

In considering the question of treating children in the way described above, one can not of course consider individual cases. Such a procedure might, in an individual case, turn out excellently, being just the thing needed for that particular child. But, if practised generally, this method would hardly be found to afford as much benefit to the strengthening of the child's character as to the strengthening of his body. Some frailties of character are indeed due to ill-health, or are accentuated thereby; but others again are due to a superabundance of uncontrolled energy. We do not want our children to grow up rollicking, wayward, uncontrollable giants, unable to accommodate themselves to the life which, willy-nilly, they will have to lead.

Therefore we must go back to the ancient principle of educating the child in a threefold manner—*morally, mentally, and physically*—and carry on all these three processes in a harmonious and rounded-out way. As we cannot force humanity all at once to change its ways, and as we do not want to become grotesque, we must adopt compromises between ultimate aims and present exigencies. But in this matter there are far more things that we might do and don't than things we want to do and can't. There are other ways of being natural besides living in the open air and wearing special clothing.

With a more brotherly and harmonious way of living, it would be possible for man to unite the advantages of a cultivated life and its conveniences with those of the country. E.

Path

Equalities and Inequalities in Human Life

(Read before the Young Men's Club of Lomaland)

ON thinking of this subject it seems to me that the equalities of life stand out more and more as the realities of life and the inequalities as a kind of illusion — an illusion, however, lasting as long as life itself. Scientists have begun to find in their researches that matter, which has been thought of as the real foundation of inequalities, is in reality built up of one essence when they penetrate beyond the atom. And every philosophy worthy of its name has considered all living things as sprung from one and the same source, from the one Spirit. Both science and philosophy here confirm the Theosophical doctrine, which is expressed by Madame Blavatsky thus:

Every most insignificant atom in the world is moved by *spirit*, which is one in its essence, for the least particle of it represents the whole; and . . . matter is but the concrete copy of the abstract Idea.

Thus we have the two poles, spirit and matter, and the play between these two poles is what we call life. Life is known and experienced through its inequalities, in other words, through relativity. We know that the one light becomes seven rays when it is passed through the prism, and each ray may be considered as again divided into seven. When the one spiritual ray is passed through its prism at the beginning of life it becomes separated into different sets of seven. In the rippled surface of the lake we may find a thousand suns sparkling, but if we lift our eyes we find one sun in the heavens which is the real sun; the reflections and separations are a kind of illusion.

In the lower kingdoms below man the inequalities are not so varied as in human life. In the crystal, for example, we find the highest and the lowest rays meet; we find the most exquisite form and the purest matter; other rays are more or less dormant, latent, in the kingdoms below man. In man they are more alive, and therefore we have more inequalities in the life of man. It seems as if the inequalities do not lie so much in the things themselves as in our attitude towards them. When a question of great importance arises the truth in it can be but one, but we all see it differently and act differently. Real knowledge is one; it depends upon us to take of it as much as possible. The great law is one and the same to us all, but it shows itself under different aspects in each one of us according to our behavior.

Thus we see that it is in and around man that the most inequalities are centered. Each man has, as it were, made his own selection out of the seven rays which focus in him; thus he has built up his character; he has a special place in nature, he has his special work. But man, as he now is, is out of harmony; in

the first place in his own set of seven — he lacks balance and poise, his character is not rounded out; and then too, he is out of harmony with everything around him. When man has reached some harmony in his own life he finds the inequalities take another aspect. Generally we are apt to think of inequalities and disharmony as one and the same thing, but it needs not to be so; the man who has reached some degree of harmony in his own nature finds the inequalities to be the means of reaching different departments of life — to work to bring about the same harmony that he finds in himself. In an orchestra, for example, we have many different instruments and a profusion of the most different sounds; here there is not equality, but all of them blend in one harmony if each one of the players does his duty and uses his instrument rightly.

When such a harmony exists among a body of men as, for instance, in degree, here at the Theosophical Headquarters, the higher influences of the soul can to that degree reach not only the individuals but even the whole Institution, the whole of the individuals. Many of the inequalities disappear of themselves in such an atmosphere of brotherhood, and the whole Institution then takes the place of the individual and it is a means of harmonizing mighty forces in the world. Each one who, as a soul, plays his instruments — his body and all his powers and faculties — rightly, as is his duty, partakes then in the greater harmony and is himself raised by his work. If the inequalities still are there, they are no longer obstacles, fetters, but useful means to bring out the harmonies of the great orchestra of the whole.

In reality life seems to be such a harmonizing process, and man stands at the balance point, able to reach in both directions. In nature we find all colors, all sounds tending towards a grand harmony. And in our human life this same end has to be reached consciously, and here lies our responsibility in that we must become the conscious co-workers with nature. It is in human life that we find the greatest disharmony; and this shows clearly how man has misused his superior knowledge and power, and how it is his duty to harmonize himself in the first place and then all human life around him as far as he can reach. Then also the lower kingdoms will profit by contact with the real man and will reach a higher state of perfection.

Katherine Tingley has said: "Preserve harmony in your own soul and it will flow out to all others." Thus the harmony will become more and more real as life goes on, and the equalities more accentuated until the cycle of life draws near its close when everything will once more withdraw into its source, into the one Spirit.

P. F.

Lomaland

MANY a pilgrim, an earnest aspirant for the "Light on the Path," has worked his way through life's crooked streets, to that wonderful altar and home of Theosophy, Lomaland. Some, perhaps, have for long floundered in the quicksands of doubt. Some, perhaps, have had duties which bound them to certain localities. Others have become enmeshed in the agnosticism of the age. But when the bonds are loosened, when the

call of duty beckons them to Lomaland, how grateful are they to those who have made such a step possible!

And as the pilgrim takes the step, even as he approaches Lomaland he feels on every hand its beneficent influence. The mountains have taken on a grander sweep. The people have seized a greater understanding of life. On every hand among travelers is found an undercurrent of respect at the mention of the pilgrim's destination. Then finally he catches a glimpse from afar of that magnificent "Beacon of Light," the dome of Loma Homestead, and his heart responds as he realizes its power and significance.

And surely one receives here a welcome, cordial in the true sense of the word. For the students on the Hill carry welcome engraved on their features, embosomed in their hearts. One feels as if the glorious "Adonai" of Zanon hovered close overhead. The magnetism of his influence seems to draw one heavenwards. Behold! The veil is lifted a little; much that the pilgrim has struggled through in ignorance is clarified. His relationship to those he has left in his former surroundings assumes a greater significance as he feels rather than hears their unconscious call for help. For the firmer and more erect the pilgrim stands upon his own feet, the greater freedom he has to maintain his balance while stretching out a hand to his fellow-man.

Here Nature herself has contrived an altar to the Supreme Spirit. For the weather and other nature conditions maintain a certain poise. The great promontory of Point Loma stands unique, commanding the elements about; on the one hand the valleys on the mainland running up to the mountains; on the other the infinite ocean. Protection is afforded from the great seas by a breakwater of sea kelp, as if nature had drawn a magical line to withhold the fury of the storm-bent breakers, that they may arrive more gently at the shore. And what a paradise for plants, for the birds. They realize that no rough hand is extended. The flowers are more beautiful; the wild rabbits have a lighter spring; the songsters are more tuneful. The scene truly recalls to mind Coleridge's lines:

He prayeth best who loveth best
All things both great and small;
For the dear God who loveth us,
He made and loveth all.

The key to the loyalty and consequent progress here attained may in part be found in the words of the *Bhagavad Gîtâ*:

Whoever in acting dedicates his actions to the Supreme Spirit and puts aside all selfish interest in their result is untouched by sin, even as the leaf of the lotus is unaffected by the waters.

The students at Lomaland, mightily helped by the unencumbered intuition of Katherine Tingley, the Leader of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, daily strive towards this Spirit. Each is considerate towards his comrade not only in outer associations, but also in control of those subtle reactions between man and man which cause so much anguish in the world. Gradually through the teaching and guidance of the Leader, the student strives to bring his Will into harmony with the Divine Will, that urges all towards perfection in service and devotion that shall at last redeem humanity. V. M.

THOUGHT

WHO hath not

Within him felt some long-forgotten world
Sweep through the corner of his former Self,
Or touch some jutting peak of memory?
Or can we prove a poet's imaginings
Are not the remnants of a higher life,
A thousand times more glorious, lying hid
Within the deepest sea of his great soul,
Till comes the all-searching breath of Poesy
To bid them rise? O Hail! All Hail the hour
When God reveals Himself, and like the Sun
Illumines every epoch of our being,
And through them all the Spirit's path shines clear
From God, through Nature, back to God again.

Hath not

The Soul a hidden story of its own—
A tide of mysteries breaking on a far
And distant shore, where memory was lost
Amid the mighty ruins of a world,
Or worlds, now vanished?

(Translated from the Welsh of *Istwyn*)
From *The Nationalist*.

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question Do you believe in a last judgment, a final judgment day?

Answer Do we believe in yesterday, today, and tomorrow? Every day is the day of judgment; are we not always reaping where we have sown? You go out in the morning, and incessantly there come to you through all the moments of the day, strand upon strand of feeling to weave into the generality of your consciousness; events impinge upon you continually, and mold your being into this form and that; and is not this the judgment?

Our whole path is made up of opportunity; every thing that we do, and every thing that is done to us, is laden with it. Events and duties speak out as they come before us—*Is it to be a building up now, or an undermining of the general work and well-being of the world? Will you pay this gold I bring you, for tribute to the gods or to the demons?* For it is always one way or the other; we are the busiest manufacturers, wonder-workers, magicians; armies and navies are always going out from our minds, inevitably to return. They are our thoughts, and the quality behind our actions; do not think that they can ever be lost.

There is the next duty that has to be done. You may treat it with reverence, finishing it very divinely; you may make it a consummate work of art, dedicate it; you, a divine craftsman, cutting it like a stone for a temple; for duty is truly the one sacrament. You may fill your whole time so, making it entirely sacred and golden; men have the power to do this. By such work you further evolution and make practical and useful sacrifice to the Divine Self of the World.

It is this that we are here to do. We are in the stream of evolution, an embodied part of universal life; and hold a large and responsible place. The law is that all things shall exert their highest faculties to the utmost; and we have mind in us, and self-consciousness, and the power to choose; we may not float with any current, but must make headway, and push things forward. We have the power to be evolvers of things, and woe betide us if we do not exercise our power. Because of it, the tide of evolution will not

carry us on without our own effort; to evolve, for us human beings, means to make the will for universal good grow stronger and stronger in us. And by such resolute and glorious care in the performance of duty, eliminating all selfish motive, we can accomplish it.

Such a course stands at one pole of our possibilities, and at the other, the most animal, selfish, anti-human life that a man can lead. We veer between these two, falling short of either for the most part. The one is advancement, the other retrogression, which nature abhors; the one is ordained in the eternal laws of all being, the other, by virtue of our free will, we may choose if we like, and suffer the consequences. The result of the one is, that we drink the full stream of life, have the whole universe for ally, rank as gods and creators, perpetually upbuilding; the judgment on the other is, that the universe is ranged against us, that we are going down towards the brutes, that every step is pregnant with the pain of decay.

You are able to be compassionate, and are not compassionate; then that part of you, the truest and most ultimate part really, is in danger of atrophy. You have will and do not exert it; it is the sword entrusted to you with your commission in the army of the gods; look that you be not unsworded and disgraced.

The will of the universe is that you shall stand up and do battle and push things splendidly forward; how far can you go in opposition to that will? Not one step without discomfort and dismay. Nature herself will camp on your tracks, and harry and haunt you with a thousand penalties. Barred and spiked doors are locked behind us at every step of our evolution; one may turn backward if he will, but it was always hard to kick against the pricks.

Could we stand out as *men*; could we fulfil all the promise we have shown, and bring to fruition only the seeds of nobility that are in us, how perfect a world would be ours! But always something intervenes and brings sorrow, and always that something is ourselves. We have made choice a thousand times to do the imperfect thing. What was unworthy of our manhood trapped us, with personal gain or pleasure for a bait; we have grown into imperfection and struck deeper and deeper root. So the eternal Law watches and tries us, having no object but our perfection. All the evil we suffer flows out of the evil we have done, and is the medicine nature offers for imperfection of character.

When you think of it, the idea of punishment is beneath the dignity of the Universal. We punish because we are irritated by offenses and conceive we have a right to revenge. The child disobeys his father, and the father's dignity is hurt and his patience ruffled. The state, as it thinks, must defend itself by offending the offender; but into all this some element of anger comes; we are more anxious to show our power and superiority than to raise up the fallen. Yet compassion is the divinest quality we know; and it is to affront the universe to say, that having it in ourselves, it is absent from the scheme of things. Is the part greater than the whole?

The harmony of the worlds is certainly disturbed when any less than right action is done or attitude taken, and the wrong must be

righted or chaos would result. So by this perpetual justice we are drawn back and reminded; no blow is aimed at us but for the correction of our character. Selfishness contracts and limits our horizon; the selfish man is the small man, and the aim of evolution is for spiritual giants, not for pygmies. "Broad is the road that leads to destruction"—yes at its opening; but it is full of traps and pitfalls; it grows thornier at every step; the Furies have their dwelling there, and are bent on convincing you of the unwisdom of taking it.

Action and reaction are equal and opposite on all planes of being. We must get rid of hampering and limited conceptions, and have some belief in the dignity of things. We did not begin to be at birth, we shall not end at death; but all life is an orderly and splendid chain, cause always followed by effect, and a little wisdom to be plucked as fruitage of every sorrow.

And the end of it all? Why, that we should be whole and consummate men; that we should stand up in equal dignity with the stars, "magnificently unperturbed"; equal in dignity with all the unerring forces of nature; compassionate, royal-hearted, complete in strength and compassion. STUDENT

THE spiritual Ego of man moves in eternity like a pendulum between the hours of birth and death. But if these hours, marking the periods of life terrestrial and life spiritual, are limited in their duration, and even if the very number of such stages in Eternity between sleep and awakening, illusion and reality, has its beginning and its end, on the other hand the spiritual pilgrim is eternal. And so the only reality in our conception is the hours of man's *post-mortem* life, when, disembodied—during the period of that pilgrimage which we call "the cycle of rebirths"—he stands face to face with truth, and not the mirages of his transitory earthly existences. Such intervals, however, their limitation notwithstanding, do not prevent the Ego, while ever perfecting itself, from following undeviatingly, though gradually and slowly, the path to its last transformation, when, having reached its goal, it becomes a divine being. These intervals and stages help towards this final result instead of hindering it; and without such limited intervals the divine Ego could never reach its ultimate goal. I have given you once already a familiar illustration by comparing the *Ego*, or the *individuality*, to an actor, and its numerous and various incarnations to the parts it plays. Will you call these parts or their costumes the individuality of the actor himself? Like that actor, the Ego is forced, during the cycle of necessity, which continues up to the very threshold of *paranirvāna*, to play many parts which may be unpleasant to it. But as the bee collects its honey from every flower, leaving the rest as food for the earthly worms, so does our spiritual individuality, whether we call it *sûtrâtma* or *Ego*. Collecting from every terrestrial personality into which Karma forces it to incarnate, the nectar alone of the spiritual qualities and self-consciousness, it unites all these into one whole, and emerges from its chrysalis as the glorified Dhyân Chohan.—H. P. Blavatsky, in *The Key to Theosophy*

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l O f f i c e P o i n t L o m a C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

Theosophy: and Psychism, Astralism, Occult Powers, etc., etc.

VERY often inquirers into Theosophy ask the question, "What have you to say about Psychism, Astralism, Occult Powers, etc.?" They have come in contact with some of the cults which are diffusing literature on these subjects all over the country, and their curiosity has been aroused by the great claims made and the alluring prospects offered by most of these cults. And so, having heard that Theosophy is in some way connected with Occult Powers, the first question they ask is one that concerns their chief interest. But very frequently, on finding that such topics do not form the principal object of Theosophy, and that the members of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY are primarily interested and absorbed in work in the interests of human solidarity, they turn away disappointed and are not seen again.

It should, however, be understood that Theosophy is *positively* concerned with Occult Powers, and that it is therefore a philanthropic movement. And there is all the more reason for emphasizing this point because certain persons, working under the names of Theosophy, Occultism, etc., have considered it their interest to represent the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY as being "merely philanthropic" and as not teaching any Occultism. By this means they have sought to deflect the interest of inquirers to their own teachings by representing themselves as the sole depositaries of Occult teaching. Such an attitude is simply grotesque, in view of the facts.

One has only to look over the literature of Theosophy to see the real state of the case. Let the inquirer, for instance, turn to *The Key to Theosophy*, by H. P. Blavatsky, or to *Isis Unveiled*, and he will see that the teaching of the existence of higher powers in Man constitutes a salient and characteristic feature of Theosophy. Indeed the whole philosophy hinges thereon; for without the recognition of man's innate divinity and perfectibility, Theosophy would be a dream; and the whole plan of elevating the race depends on an insistence on the fact that man does possess latent higher powers.

Again, the numerous and widely advertised cults which deal in psychism would never

MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

have been heard of, if they had not had Theosophy from which to borrow their wares, and upon which to found their teachings. They are in fact cheap imitators; and, like all such, find it profitable to denounce the genuine faculty. They have committed a great wrong against the public by clouding the real issue and luring people away from the genuine teachings towards their own.

But Theosophy is compelled to insist strongly and persistently on its primary object—the elevation of the human race. For that purpose alone H. P. Blavatsky undertook her herculean task of founding the Society. She was the agent of Those who have at heart the welfare of humanity; and it was no part of their purpose, or hers, to found a popular school of magic, or a hall of "easy-go-lucky" learning among the varied classes of Western civilization.

For those, then, who propose to themselves to acquire occult powers and mystic learning for the gratification of idle curiosity, personal ambition, or pleasure, and without any intention of using their powers in the Great Cause, Theosophy has no answer but a warning. It warns them that they are on a track that can only lead them into trouble; for, unless selfishness is first conquered, any powers that may be acquired will become the servants of Desire and will thus become agents of destruction for the possessor, instead of instruments under the control of his enlightened Will.

But for those who believe that the highest destiny of man is to use his every faculty in the service of his kind, Theosophy will point the road to the attainment of actual Spiritual powers, by which a man may become emancipated from the thralldom of ignorance and impotence and gain that wisdom and power to help, that Jesus and other Teachers have spoken of. Once let such an inquirer show by his conduct that his motives are worthy and sincere, and the life which he will forthwith enter upon will be rich with opening vistas

of valuable knowledge and attainment. He will find that Occultism is a *reality*, and that the powers latent in man can be called forth. But at the same time he will be protected against the disastrous consequences of yielding to ambition, self-gratification, and vanity, and thus injuring both himself and the work he would serve.

The widely advertised teachings about Astralism and Psychism contain in many cases some particles of truth mixed with a great deal of error. It is a shame that such things should be offered to the public, for it is like offering acorn-bread or fiery poisonous spirits to starving peasants. The public is starved by the churches and sciences, which can offer it no real food for its soul; and it turns to these fads, many of which are purely money-making concerns, after the dollar. But they are will-o'-the-wisps, and can only disappoint and disillusionize. Theosophy has the true waters of life, and it alone teaches the real Occultism. This is subject to proof by anyone who will take the trouble to examine. Pretty soon the world itself will realize how it is being deceived by these cults, when it sees what their teachings lead to, as it is already beginning to see in many cases; and then it will be glad to turn to Theosophy.

Bolts From the Blue

THERE are various kinds of Karma, individual, national, and racial, whose effects rule on physical, psychic, mental, and moral planes. To these would be added other classes relating to planetary life and to the whole solar system; for it is traveling continually into new regions of space among meteors, fragments of broken worlds, tenuous and even invisible entities—as when sun and moon were deep red for five days in 141 B. C. The physical body of man is subject to any of these kinds of Karmic action; and had there been some one standing where Coon Hill is, in Arizona, some 5000 years ago, he must have become suddenly convinced of this. The hill is 130 feet above the plain, but has a "crater" more than 500 feet deep, which science says was caused by the impact of an enormous meteor. But the Arizona Indian of those days would hardly be disconcerted by the sudden loss of his physical body; so he probably went on his way rejoicing. D.

THE THEOSOPHICAL ADDRESS AT ISIS THEATER

LAST Sunday coming as it did next to May 8th, White Lotus Day, which is always held commemorative of the life and work of H. P. Blavatsky, a special anniversary program was given at the meeting of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY at Isis Theater. The decorations were almost entirely in white.

Two addresses were given, "The Girlhood of Helena P. Blavatsky," which was published in the CENTURY PATH for May 9th, by Miss Margaret Hanson, one of the pupils of the Rāja Yoga Academy; and "H. P. Blavatsky—A Teacher of Humanity," by Mrs. Marjorie M. Tyberg.

In a very real sense, said Mrs. Tyberg, was H. P. Blavatsky a Teacher of Humanity. The manner of her coming, the work that she did, the institutions that she established, the teachings that she gave her pupils, the philosophy and ethics that she placed before the world, prove her to have been—in a way unexpected by Humanity and as yet unrecognized by some—a response from out of the universal heart and mind to the bitter cry bursting from human beings too confused and ignorant, too self-centered and materialistic, to know their real needs.

Students of the Nineteenth century had searched the kingdoms of nature and the very heavenly spaces in order to find data that could be arranged in some system that would reveal laws of development. But they had not succeeded in formulating any theory that thoroughly satisfied the human heart and mind, and there were great gaps here and there in their systems that left much open to question, and might have warned them of their ignorance instead of making them arrogantly certain of the validity of their theories.

The trouble was that they did not know anything about the soul, the unifying principle; they did not know the laws of their own being, or the composition of their own natures. This teaching of the Soul, the thread linking all things manifested, this knowledge of the dual nature of man, which when further analysed gives the septenary corresponding to the septenary in the Universe, were brought by the Teacher of the Nineteenth century, and in the spoken and written words of H. P. Blavatsky they may be found.

H. P. Blavatsky in restoring man to his true place in the Universe, gave him the world anew, and at the same time armed him with the spiritual weapons that should purge the world of all that hinders progress and holds back humanity from realizing its full powers and possibilities.

This Teacher came not to one race or people, be it remembered, but to the world, and the wisdom she brought, if taken to heart by the nations and applied to daily life, breaks down all barriers that stand between nation and nation, and man and man. It is easy to see that this wisdom had to reach persons of every race and creed, if this essential unity were to be recognized. So the Teacher established the THEOSOPHICAL SOCIETY AND UNIVERSAL BROTHERHOOD, without distinction of race, creed, caste or color, and made it the vehicle of the teachings of Brotherhood for the world.

OBSERVER

"What Men Call Religion"

IN *Religious Education* Miss Jane Addams, commenting on the failure of religious education, says:

Those of us who live in Chicago are obliged to confess that last year there were arrested and brought into court 15,000 young people under the age of twenty, who had failed to keep even the common law of the land. It is said, indeed, that practically the whole machinery here of the grand jury and the criminal court is maintained and operated for the benefit of youths between the ages of thirteen and thirty-three. . . . And yet these 15,000 children had all been subjected to some sort of religious instruction.

What sort?

A recent book, *The Heathen Heart*, described as "one of the finest missionary books ever written," tells of the difficulties in teaching Christianity to the Chinese. Their assimilative power is said to be very limited. Harnack is quoted as saying the same of the early Christians. These too got hold of something they called Christianity by all sorts of odd corners. In drawing the parallel the writer lets us see what is his idea of religion or of Christianity:

And just as (was the case) in the early Church, (so among the converted Chinese) there is but little knowledge of the work of the Holy Spirit in convincing men of sin and revealing the things of Christ. . . . As the work of the Son and of the Holy Spirit is so imperfectly understood, there can be no clear view of justification by faith alone. The idea is as foreign to Chinese Christians as it was to Christians of the first three centuries.

But as to those 15,000: were they taught about "the work of the Holy Spirit," "sin," "the work of the Son," the difference between the two "works," and the "clear view of justification by faith alone"?

Or were they given absolutely "non-doctrinal religious instruction," that is to say the wanderings of the Jews, lists of their kings and judges, etc., etc., and the biography in the Gospels?

The missionary tells us that the Chinese are not interested in the Old Testament. As to the New:

Some of the details of the story of Jesus may perhaps awaken a natural interest; yet the people are apt to move off long before the close, and if they listen to the account of the Crucifixion, it is not always with emotion, . . . in general with a very languid attention, so that birth, death and resurrection are soon alike forgotten.

Miss Addams points out that youths have a great deal of energy which must somehow find employment. In the case of the 15,000 it got employment in crime. "Only a capture of the imagination and the deepest emotions of youth by what men call religion could have prevented them."

It is obvious that "what men call religion" had not captured the imagination and the deepest emotions of the 15,000. It is nearly as obvious that what the missionary called religion, of whose dogmas he gives samples as above, is incapable of capturing any imaginations. So is the Jewish history in the Old Testament. There remains therefore the life of Christ. Why did not this capture the 15,000 imaginations and emotions so strongly as to guide the expenditure of the energies of youth? Why were the words of Christ so little effective in the school readings of the Gospels?

The truth is that the picture of Christ must be taken out of its old setting and put into

another; and this cannot be done except by Theosophy. The old setting is not only too small but too much dulled and dimmed by the pulpits. Moreover there must be a previous picture, also only to be given by Theosophy.

In our education a child's attention is never drawn to *itself* as non-identical with, as potential ruler of, mind and bodily passion. Its attention is wholly *out* from itself among these instruments. These are non-divine; self or soul is in its nature divine and as soon as it recognizes itself it necessarily begins to wish divinely and act divinely. This sort of awakens to self is a state of consciousness absolutely unknown in modern education; it includes goodness, of course, but is much more. It includes joy and the ripening of every latent mental and artistic faculty in each particular nature.

It is only to the extent that this awakening is happening, that this freedom is being won—that the Christ nature, wherein the awakening and the freedom are *perfected*, can be understood. Jesus was "a man of sorrows," yes; but his sorrow was not maudlin self pity; it was wholly and solely for the bondage of others. He wanted all men to have the splendor of his own inner life. He abstained from the use of his powers in self-defense for the same reason as he abstained from the use of them in composing music or becoming an athlete or a poet—because these other uses would have interfered with his work and the influence he was to exert at that particular time and among that particular people. At another time and elsewhere it might have suited the same purpose to write philosophy or oratorios.

In other words, what must be taught is a *virile* Christ, not the meek sentimentalist of the pictures; calling upon men to develop the fulness and the joy of life through conquest of passion, through hatred of evil within and without themselves, and through compassion for those who suffer and for those who still regard the domination of passion as life.

Civilization and Natives

A REVIEW, in *John Bull*, (London), of *A Winter in South Africa*, a book by a well known English Nonconformist minister, says that it is calculated to shake some of the smug conceit out of us as civilizing agents, and make us think that it would have been better for the native had we never set foot in his country.

It is a pity that colonial expansion should always be marred by the degradation, corruption, and misery of so many of the natives of whatsoever country we favor with our attentions. . . .

No one with any first-hand knowledge of him will pretend that the South African native is an angel. He is not. And no missionary effort is likely to make him one. But it must be confessed that in many respects his morals are naturally purer than those of the so-called Christians who invade his country in shoals, bringing with them the Bible, the Bottle, Blasphemy, and Debauchery. Upon the genuine morality of the native races the presence of Europeans descends like a blight. The simple but stern system of ethics which, as in the case of the Zulus, contributed to produce one of the finest races—at any rate from the point of view of physique—the world has ever seen, is swept aside, and the easy morality of Europeans, with its consequent physical degeneration, is substituted in its stead.

We may rescue them from the grip of beri-beri

and other equatorial maladies; but we bring them in exchange smallpox, consumption, and other unnamable diseases. We may teach them to be less bloodthirsty, but at the same time we awaken in them an uncontrollable thirst for whisky (?) and gin (?). We send out missionaries to rouse their souls to a consciousness of the brotherhood of man, and follow it up by kicking them off the pavement in Johannesburg.

It would not be so bad if the whole thing were not cloaked in so much hypocrisy. . . . Let us once fairly realize what influence the presence of Europeans exerts over the native in nine cases out of ten, and we shall have made the first move toward a better order of things.

The reason why our civilization is not beneficial to natives is that the benefit of the natives is not our motive for invading countries. It is for other purposes that we go there. Consequently we can hardly expect that the natives will be benefited.

If, therefore, we desire to benefit the natives, we must make that our object in entering their territories. Thus the matter is stated clearly and without cant, so that we can take our choice.

Of course, what we want to do is to secure our other objects and yet at the same time save our conscience by benefiting the native. This hypocritical attitude results in half-hearted measures and pretences.

But why should we want to benefit the natives? Honestly it must be confessed that according to the most prevalent ideals, there is no justification for the continued existence of natives. (!) What good do they do? So they are treated with grudging hospitality, like people who claim our regard but do not possess it.

Trade seems to be the great watchword of civilization at present. In unions of nations it forms practically the sole motive. Exploration has it for its chief end in view. The natives stand in the way of trade.

It can only be said that the reason why we should seek to benefit the native is that we may thereby fulfil our duties to our fellow human beings and realize our highest conceptions of our function as human beings.

But though the honest desire to benefit the natives is the necessary first step, it must be followed by a greater *knowledge*. For at present who can claim to have an adequate idea of what is best for the native? Some champions of modern civilization may honestly believe that our present notions of life are the ideal state and that the whole world should be made to adopt them or perish in the process. Others will regard the destructive effect of civilization upon natives as evidence of its shortcomings, and may for other reasons be disposed to regard the blessings of modern civilization with a doubtful eye.

To a Theosophist, regarding the present state of civilization as defective enough, and aspiring to a better order of things, the plan of imposing that civilization upon all the world will not commend itself. Hence he will not try to convert the natives to any one of the religions of civilized peoples, nor to impose upon them all the habits and ways of thinking of civilized people. His first aim, on entering their land, would be to get to understand them. If he desired to help them, he would feel it necessary that he himself should live up to his own teachings, so as to avoid hypocrisy and its consequent failure. He would take their own religion and show them the essen-

tial truths in it, exhorting them to live up to those truths and to eliminate the excrescences of superstition. He would not try to abolish their ancient institutions, but would urge them to renovate those institutions and establish them in their former purity. He would not teach them to wear clothes that did not suit them or to eat things that did not agree with them. In this way he would help the race to develop itself along its own best lines; and his help would be repayed by the new things he would learn from it.

Thus, instead of killing out races, as some have been killed out, we should be helping them past the low point in their cycle; and these descendants of the mighty civilizations of the far past might rise again to a new glory.

One thing we are learning very rapidly just now is to take a juster view of the capabilities of such races. Their apparent wildness and intractability easily yield to sympathetic treatment; when their intelligence is appealed to, they quickly respond. But when treated as brutes they are encouraged to be brutal.

Aborigines protection societies represent inchoate efforts to realize better ideals; they undo some of the evil that civilization does. May they grow until they become representative of civilization!

Missionaries probably do good, though they also contribute to the evil. But at best they are a poor substitute for what ought to be. Another kind of missionary is needed—one who understands; one who lives the life, not according to the average Christian ideal, but according to a broader, higher ideal. We have seen pioneers approximating to this stamp; but their work has been undone by their followers. Unity in recognition of the Divine Law of Brotherhood is needed.

STUDENT

The Educated Chimpanzee

IN London has been exhibited a chimpanzee which dresses itself, partakes of a meal, and does other things, just like a man: It was never trained, says the owner; he has merely lived with human beings since he was nine months old, and has copied them. The owner also believes that the intelligence of apes is capable of being developed to an even higher level. If you could get a succession of chimpanzees—father, son, grandson, etc.—living with a human family, the resemblance to humanity would grow with every step in the succession, and possibly even physical differences would disappear.

The importance of this, of course, is the supposed support it would give to the theory of human derivation from apes. But, unfortunately for that theory, there is the "if." And that "if" means everything. You cannot get such a succession of chimpanzees: chimpanzees in captivity *will not breed*.

Thus we can assist Nature to do what she purposes to do; but she will not necessarily lend herself to our purposes. And neither Nature nor man is able at the present time, to breed a human being out of a chimpanzee. Whether chimpanzees at any time begat anything but chimpanzees does not seem probable. One thing, however, we do find; and that is that man is capable of degenerating—how far we can not say. T.

A Reincarnating Idea

DR. HARVEY RUTLEDGE, a well known English alienist, speaking of the difficulty of precisely demarcating insanity, tells of a family in Hertfordshire, England, known to himself

whose eldest sons have been insane for two hundred years, and whose malady has developed regularly on the nineteenth birthday, with precisely the same delusion—to wit, as the lawyers would say, a belief that both feet were fish and that they should be kept in water. . . . The firstborn, in the male line, has been the director or the overseer, as you would call him in this country, from the age of twelve, and it is of record that this direction, even in a boy so young, has been successful, and has added to the value of the estate. The peculiar delusion which takes possession of the heir, on his nineteenth birthday, does not appear to affect him, so far as the lands are concerned. He thinks his feet are fish, but there is no detail connected with the household or the lands that escapes his attention, and there never has been any attempt to prove insanity, although the eldest son from his twentieth year up to his death, keeps his feet constantly immersed in a wooden tub.

This, surely, can hardly be called heredity, something transmitted in the line of germ plasm. The first case created the picture, and it has lived in the collective family mind ever since. It is only waiting some son strong enough to refuse to yield and thus destroy its life. But each one who does yield reinforces it.

STUDENT

Teutonic and Latin America

PEOPLE are apt to look upon the Spanish-American Republics as places where they lightsomely pass the time in revolution. A recent official report shows that they know how to give an eye to the sterner issues of business. The International Bureau of American Republics tells us that the trade of these South American nations increased by 120 per cent during 1897-1907, reaching the magnitude of \$2,625,000,000 for the latter year.

These Republics have a population of about 70 millions, occupying an area three times that of the United States. They are increasing as fast as we; they have as much energy as we, even enough to run over into exuberant revolutions. Will there be permanently Teutonic and Latin Americas? Or shall we receive enough Latins and they enough Teutons to make us, say by the end of the century, similar peoples? Or will some subtler difference manifest and maintain itself? Will their minds be subtly touched by the ever present echoes of those mighty and forgotten civilizations whose remains lie along the eastern slope of the Andes, on the unexplored plateau inland, and in the Central American forests? We in the north have our relics, but not like these, not so cyclopean, not so immediately Atlantean. Our trace-leavers seem to have gone much farther down the arc. STUDENT

A Fluid-surface Telescope

MUCH interest has been aroused in a new roating-mercury-surface telescope described in the *Astrophysical Journal*. One could imagine a large one—with all difficulties of obtaining steady speed overcome—mounted in a deep rock-pit on some high mountain where seismic disturbance is at a minimum, and where the air would at times be clear and steady. Clock-controlled auxiliary mirrors would, however, be needed in order to follow regions of varied declination. J.

Art Music Literature and the Drama

Some Intimate Glimpses of Thomas Carlyle

ALAS! Sir, the days in which our lot is cast are sad and evil. All virtue and belief and courage seem to have run to *tongue*; and he is the wisest man, and the most valiant who is the greatest talker. The world has transformed itself into a parliament, an assemblage whose prime and almost only business is to talk, talk, talk, until the very heavens themselves must have become deaf with the ceaseless vociferation. Our British nation occupies a sad pre-eminence in this matter. Demagoguery, blustering, vain-glorious, hollow, far-sounding, unmeaning Talk, seems to me to be its great distinction. On earth I think is not its fellow to be found, except, Sir, in your own demagogic and oratorical nation. I am certainly afraid that popular oratory will be the ruin of the race; and that the verdict of the jury that shall sit upon the corpse of our civilization will be "Suicide by an overdose of Oratory!"

This from Carlyle, noble, sincere, grandly rebellious Carlyle, who was, they tell us, when he consented to talk at all, one of the most persistent talkers in the universe or out of it! Of course, there is this minor difference—Carlyle usually had something to say.

Froude has given us his editing of Carlyle's letters and till then unpublished manuscripts; others have given us biographies of one sort or another, and we have the writings of this grand old Spartan, so there is no lock upon the door—except we put it there ourselves—that opens into the world of rugged sincerity and battlesome endeavor in which he lived. But, not unnaturally, some of the clearest sidelights upon the real man flashed out in his conversation and we may be grateful to Mr. Milburn for preserving to us the reflection of them. This friend of Carlyle was blind and perhaps because of this infirmity his memory had quickened to such a degree that he was able to jot down, after one of his visits with the author, whole conversations, virtually word for word. The above and the excerpts which follow are from the accounts published by this blind scribe.

Carlyle's love for his father is shown forth in the following—Mr. Milburn's account, as stated, of part of one conversation. It discloses the father's nature, but Carlyle's more.

I think of all the men I have ever known, my father was quite the remarkablest. Quite a farmer sort of person, using vigilant thrift and careful industry; abiding by veracity and faith, and with an extraordinary insight into the very heart of things and men. I can remember that from my childhood I was surprised at his using many words of which I knew not the meaning; and even as I grew to manhood I was not a little puzzled by them, and supposed that they must be of his own coinage. But later, in my black-letter reading, I discovered that every one of them I could recall was of the sound Saxon stock which had lain buried, yet fruitful withal, in the quick memory of the humbler sort of folk. . . .

The parish minister was the first person that ever taught me Latin; and I am not sure but that he laid a very great curse upon me in so doing. I think it is likely I should have been a wiser man, and certainly a godlier one, if I had followed in my father's steps and left Greek and Latin to the fools that wanted them.

The last time I ever saw my father was on my journey from Craigenputtock to London. I was on my way to this modern Babylon, with a manuscript in my hand, "Sartor Resartus" by name, which I wished to get into print. I came upon my fool's errand, and I saw my father no more, for I had not been in town many days when tidings came that he was dead. He had gone to bed at night as well as usual, it seemed; but they found in the morning that he had passed from the realm of Sleep to that of Day. It was a fit end for such a life as his had been. He was a man into the four corners of whose house there had shined through the years of his pilgrimage, by day and by night, the light of the glory of God. Like Enoch of old, he had walked with God, and at the last he was not, for God took him.

In another conversation Carlyle said of his

Lomaland Photo. and Engraving Dept.

THOMAS CARLYLE. CHELSEA, 1865

old school-friend Edward Irving—and he gives us as marvelous a picture of his own mystic faith as we could ask to see:

And from Scotland he (Irving) came to this great Babel; and he stood up in the pulpit of the Hatton Garden Chapel, the eyes of him blazing and the herculean form of him erect. And the great, and the learned, the high and the titled, the gifted and the beautiful, came round about him, and sat mute and spellbound listening to his wonderful words. And they thought—for fools will ever think according to their folly, which is the law of their being—they thought that because they were looking at him he was looking at them. He was not looking at them at all. He was trying to do what no man can do and live—trying to see God face to face.

I have heard that the eagle's eye suffers eclipse . . . by the steadfast gazing at the brightness of the sun. It was so with Irving. The curtain of darkness fell over the eagle's eye of him. In blindness and loneliness he sobbed the great heart of him to sleep.

Mr. Milburn once asked Carlyle the cause of his dyspepsia—that chronic ailment of his which is probably as well known as the name

of any one of his books—and the latter said:

I cannot tell. I only know that I had grown up the healthy and hardy son of a hardy and healthy Scotch dalesman, and that he was the descendant of a long line of such—men who had gone down to their graves, never a man of them the wiser for the possession of this infernal apparatus. But the Voice came to me, saying, "Arise and settle the problem of thy life!" and so I entered into my chamber and closed the door, and around me there came a trooping throng of phantasms dire, from the abysmal depths of nethermost perdition. Doubt, Fear, Unbelief, Mockery, and Scorn were there; and I arose and wrestled with them in travail and agony of spirit. Whether I ate I know not; whether I slept I know not; I only know that when I came forth again it was with the direful persuasion that I was the miserable owner of a diabolical arrangement called a stomach; and I have never been free from that knowledge from that hour to this, and I suppose that I never shall be until I am laid away in my grave.

And Thomas Carlyle was right, though he lived to see his eighty-sixth birthday!

In 1860, when Louis Napoleon was apparently as secure as the over-arching sky, and it was a full decade to Sedan, Carlyle said, prophetically, to Mr. Milburn:

Yes, Louis Napoleon used to talk to me about the Spirit of the Age and the Democratic Spirit, and the progress of the Species; but for my own part it seemed that the only Progress the Species was making was backward, and that the Spirit of the Age was leading people downward; and we discovered that we didn't understand each other's language. We parted—as mayhap did Abraham and Lot—each going his several ways. It looks to me very much as if his way would lead him to Sodom. . . . I certainly expect that the day will come when the blue sulphurous flames will dart from behind the scenes and consume the pile with all that are in it; or that the edifice will give way in a crash of ruin.

One day, upon Mr. Milburn's stating that he was a Wesleyan, "or, what is the same in America, a Methodist," Carlyle burst out with:

I must tell you, Sir, that I have ceased to think as highly of that people as I used to do. It was formerly my fortune, whenever I went to service, to attend their chapels. We've a queer place in this country called the Derbyshire Peaks, and I was there one summer and went on the Lord's day to the Wesleyan chapel; and a man got up and preached with extraordinary fluency and vehemence, and I was astonished at his eloquence. . . . And when he had ended another man came forward and prayed; and I was greatly moved by the unction of his prayer. But the sum and end of all the fluency and vehemence of the sermon, and of all the fervor of the prayer, was "Lord, save us from hell!" and I went away musing, sick at heart, saying to myself: "My good fellows, why all this bother and noise? If it be God's will, why not go and be damned in quiet? I, for one, would think far better of you." So it seemed to me that your Wesleyans made men cowards.

The Theosophist sees clearly the limitations of both expression and ideal in the writings of Thomas Carlyle, but that this hardy protestant was ahead of his time there can be no question. And his courage, his rugged honesty of purpose, place him in the ranks of those who love and serve mankind. STUDENT

No teacher can teach until the pupil is ready to learn.—Katherine Tingley

IT is evident to those interested in the matter that there is something wrong with juvenile religious instruction, because the children are not religious. There are many troubling themselves over this problem. Mr. Joseph V. Collins, of the Wisconsin State Normal School, thinks that he has evolved a plan which will answer it and "meet all the requirements of religious education in the United States." He proposes, in brief, that instead of the usual hour's session there should be a two- to three-hours' session conducted more or less as are the public schools. The pupils should be graded, and permanent books printed in place of the leaflets now in use. There should be a study room with a teacher to keep order, maps and reference books convenient, and all the paraphernalia of a modern schoolroom; only, of course, the subject matter would be so-called sacred matter instead of profane.

With all due respect to this reformer, we beg to differ radically from his opinions, feeling sure that this plan will not in the least degree meet the present needs. It is to be presumed that religious instruction must have for its object the improvement of character, and should help in some way those who come under it to lead better, purer lives; to have nobler ideals; to be better fitted to meet the trials and solve the problems of everyday existence. That the churches and Sunday schools are failing to bring about these conditions is the real reason for the growing lack of interest in them and the constant feeling, vague or well-defined, that they are in need of reform.

How a little more brain knowledge of Bible history and church doctrines is likely in any way to supply this need we are utterly unable to see. Rather we emphatically deny that it can, because the vital thing lacking in the schools, is proposed also to be shut out of the church training, and the whole attention di-

Proposed Sunday School Reform

verted from the vital issue. It is difficult to believe that anyone deeply interested in the education of the young could seriously propose such a plan with any hope that it would meet the requirements. It leads one to ask in what religious instruction consists; whether it implies simply an accumulation in the

THE WORD

THE knights rode up with gifts for the king,
And one was a jeweled sword,
And one was a suit of golden mail,
And one was a golden Word.

He buckled the shining armor on,
And he girt the sword at his side;
But he flung at his feet the golden Word,
And trampled it in his pride.

The armor is pierced with many spears,
And the sword is breaking in twain;
And the Word has risen in storm and fire
To vanquish and to reign.

William Watson

brain of a few more facts; or whether it implies the *evoking of something deeper in the nature*.

The whole suggestion is born of the present-day ignorance of Soul life, and shows how we are running to seed in brain culture. If it were the idea in the Sunday schools to teach the children the truths about their own nature; to open their eyes to their own weaknesses; to show them the way to work to overcome them; if they were to be taught in some way (not by brain development) how to forget themselves in the service of others; if their sense of responsibility were to be awakened; if they were to be taught the truth about their lower natures—if all this were done one might hope great things of these

Sunday classes. But alas! the Church itself does not know these secrets. It has forgotten

the truths as to the nature of man, and how can it teach them? So therefore, the thinking mind can have little faith in the efficacy of this reform, even should it be carried out thoroughly.

Theosophy can supply this lost knowledge to humanity, and Theosophy alone. It is, in fact, nothing less than the old knowledge brought again to light, and offered to the world. Those who have studied it realize how hopeless is the present situation without it; and they realize, further, that however ennobling may be ideas presented to anyone, youth or adult; however much of actual knowledge they may be taught, it is all useless, unless put into practice. However pure may be the virtues taught, unless they are practised they are a shame instead of a glory. And to put Theosophy into practice has been the aim from the beginning. H. P. Blavatsky wrote, years ago, in *The Key to Theosophy*:

If we had money, we would found schools which would turn out something else than reading and writing candidates for starvation. Children should above all be taught self-reliance, love for all men, altruism, mutual charity, and more than anything else, to think and reason for themselves. . . . We would endeavor to deal with each child as a unit, and to educate it so as to produce the most harmonious and equal unfoldment of its powers, in order that its special aptitudes should find their full, natural development. We should aim at creating *free men and women*.

Therefore the Râja Yoga system has as the basis of all its teaching the formation of strong, true characters, knowing full well that without this the structure of learning will be "like the house which is builded upon the sand." The superstructure—the brain and other culture in this system—is not neglected, is even more free and generous; but it is founded upon a rock, and enables its pupils to leave rich heirlooms to the race. **STUDENT**

The Wrong Education and the Right

CERTAIN teachings were given us when we were children, of which the aroma hangs about us yet and is almost unescapable. They had no kinship with what we naturally believed, but came as a kind of shock to us; we had perceptions, but these were at discord with them. The wealth and bounty of divine life around us was allowed no part in the conduct of our lives. We knew of more daily miracles than were written down in all ancient books, but found it wisest to keep silence about them. The goodness and the naughtiness we heard of were, so far as we were concerned, arbitrary conditions founded upon nothing we could understand.

If only someone had told us that the Great Life was wounded by our selfishness, and grew more vivid and exultant as we played our part! Very easy would it have been to perceive that, for evidence of it was forced upon us every day. Sometimes there was no magic in the grass blades, and no familiarity in the winds; or the sun and the mountains were aloof, not condescending to have dealings with one who had played for his own hand. But our elders had been divorced long ago from such companionship, and could speak no inward language that we understood. All that we heard was that we were naturally miserable sinners and worms who must pray hard to escape from the anger of God.

What should we know of God, that could be learned in dim churches, and the record of a long dead, alien time? There was no help for us there. We had within us Divinity and the seed of unconquerable heroism; all the elements necessary for solving all the problems of life. These were native flowers, too; as they are native in the soil of every human heart; which, with a little care and attention would have grown up and blossomed an hundredfold. Oh, help was given us, no doubt it was; lavish and persistent help; but because you must have knowledge before you can help to any purpose: because if you have no perceptions, no wisdom, you would better keep out, you will only be a bull in a china shop if you go in: because wrong teaching having been in the world these centuries, there is very little perception or wisdom to be found anywhere — plenty of energy, plenty of sentiment, plenty of fondness and well-meaning, but very little of that insight that enables one to do the best thing in the best way — for all these reasons the help that was available was mostly hindrance after all. The fair indigenous lilies were neglected, went unwatered from season to season; weeds were allowed to grow up around them; garish exotics were set in, and carefully tended in their place.

Be unselfish that you may go to heaven; so we were taught; they did not know that if one were unselfish, he would eagerly seek out hell, that he might do something to help or save the sufferers. No wonder the glorious gates were closed on us at last, and the quick became the dead; and everflowing life and beauty this sordid struggle to live. You cannot cast out devils in the name of Beelzebub the prince of the devils, nor be unselfish for the selfish end of gaining your own salvation.

All this great sin of selfishness is just an unnatural thing, just a weed that grows in the human soil. Wise teachers might have shown us its folly and unnaturalness when we were

young children, and helped us to tear it out once and for all. We might have lived always in the great, wide, beautiful life, with all things still quivering with wisdom and wonder and mystery. When the passions came knocking at our doors, we might have known much better than to have opened them in the least to such beggarly impostors.

Let children learn these things, and they shall not waste the moments of their lives as we have done; experience will lead, and not drive them with a whip. Let them learn that in this grand unity of life there are infinite lessons to be learned, and that we are here to learn these lessons; to try our spiritual muscles upon innumerable problems going from strength to strength, growing; never in stagnation. All that befalls us of events and conditions is the direct outcome of what we ourselves have done and thought, the whole pur-

OLD COTTAGE IN GRENNÄ, SWEDEN

pose being for our education; and we have lived countless lives upon earth, figuring in all races and every age; always active, always affecting the life of the world, even if ever so little, for good or ill: always in our actions sowing seeds, always, in the events of our lives, reaping the harvests of that which we have sown; and reaping these harvests always in order that we may learn. All are so learning, so advancing, so adding slowly to their wisdom and firmness and compassion; all upon the most interesting of all quests, and the most vital; all vitally interested in the welfare of all — and if any be seeking his own ends, he is seeking waste and ruin; he is traveling in a blind alley; his face is set directly away from the goal.

He may work for self but shall reap of that work nothing that is good to have and hold, only sheaves of disappointment and bitterness, ruin and nightmare, ashes and desolation. But let him forget self, once or many times or forever, and work for others. There shall await him, just to the measure of his selflessness, the harvests of the soul. STUDENT

Jottings and Doings

(From a Student's Note Book)

ON April 14th last, a group of musicians in Europe celebrated the Centenary of Maria Theresa Lehmann, now almost forgotten, and undeservedly so, because overshadowed by the fame of her daughter, Lilli Lehmann, the great interpreter of Wagnerian music-drama. But she is worthy of being remembered because of her friendship for and service to the great Wagner when he was young and unknown. She was both singer and harpist, often appearing on the German stage in the double capacity of soloist and performer upon the harp in the orchestra when Wagner was conducting the latter. It was Madame Lehmann (then Maria Theresa Loew) who induced a Prague impresario to buy the scores of *Lohengrin* and *Tannhäuser* at a time when the young Wagner was in

serious need of financial assistance and when the help was worth a hundred times what it could have been to him later. Madame Lehmann appeared first in *Der Freischütz*, just three years after Weber's death. Her life in a singular way extended well across a transition period in German music.

Of all the doughty warriors who have struggled with the question of the modern enormous hat as sold by milliners — and worn by women — the officials of the Swiss State Railways alone appear to be striding towards complete victory. Their official notice, recently posted in the railway stations along their lines, reads as follows:

Ladies hats more than 31½ inches in diameter will, according to article 117 of the railway tariff as adopted in February 1906, henceforth be regarded as wheels. Any lady wearing a hat of larger dimensions who desires to travel by a Swiss passenger train must either ride in the luggage van or deposit her hat with the luggage guard and enter the passengers' carriage bareheaded.

Once again we may take up the shield of courage and the sword of victory.

OUR YOUNG FOLK

Clovelly

CLOVELLY is a quaint little town on the northern coast of Devonshire, England. It has about two hundred inhabitants. Perhaps one might call it the Amalfi of England, for like Amalfi in Italy, it is situated in a small cañon or ravine opening out to the sea. The ravine at Clovelly opens out from a high wooded coast, and a fine beach below reaches for miles on either side of the ravine. The town itself belongs to an old estate, the beautiful parks and drives of which stretch inland. It is a delight to wander through the parks as they are kept in a partially wild state and heather and foxglove bloom along the way and ivy embraces the old oaks.

Clovelly is about two hours' ride from Bideford by stage. When you arrive at the top of the ravine your trunks and bags are heaped on wooden sleds drawn by donkeys. While you walk down the main street which consists of a long series of cobble-stone stairs, your baggage comes bumping along behind you. You will stop at the New Inn, of course, and you will be shown into a quaint little bed-chamber with latticed windows, white dimity curtains and bed with ruffled valance, and everything so very fresh, clean, and old-fashioned. The dining-room walls are covered with rare old china of different patterns, plates, cups and saucers, and large platters, a really valuable collection. One wonders how it found its way into the little town of Clovelly.

After breakfast you stroll down the little street as shown in the picture, past the quaint cob-houses (houses built of cobble-stones, earth and plaster) with their old-fashioned gardens before the doors, and the friendly people ready with a bright "good morning."

The beach is reached after descending a steep staircase, and here stands the life-saving station. The lifeboat was propped up ready to slide out to sea at a moment's notice, and the crew's oilskin suits were all ready to put on. They will tell you that several wrecks have occurred along the coast and that many lives have been saved. They seem to regard their life-saving station as one of their most precious possessions.

There are several lanes leading about the town, and one, if you are willing to do some climbing, will lead you up under arching bushes, until you reach the top of the cliff as if from a hole in the ground. Going down that way reminds one of the hole Alice went down after the white rabbit, only the passage is not so dark.

Most of the people in Clovelly have lived there a long time and few have ever traveled

Lomaland Photo. and Engraving Dept.

A STREET IN CLOVELLY

MAY

HARK! the sea-faring wild-fowl loud proclaim
My coming, and the swarming of the bees.
These are my heralds and behold! my name
Is written in blossoms on the hawthorn-trees.
I tell the mariner when to sail the seas;
I waft o'er all the land from far away
The breath and bloom of the Hesperides,
My birth place. I am Maia. I am May.

Longfellow

as far as London. If you ask them how old the town is they will tell you they do not know but that they believe it has been there always.

The gentle friendliness with which you are treated by everyone makes you feel that the town consists of one large family and that you are there on a visit. Away from the bustle of the world and amid so much natural beauty as they are, it would seem that trouble and selfishness could not reach them; but we know that these are in the human being himself, so joy and sorrow must be here too. But the people of Clovelly have a touch of something genuine about them which draws you to them, and loving thoughts will always go out to these friendly souls after a visit to the quaint little town.

EUGENIA

THEY are never alone who are accompanied by noble thoughts.—Sir Philip Sidney

INSTEAD of saying that man is the creature of circumstances, it would be nearer the mark to say that man is the architect of circumstances. It is character which builds an existence out of circumstances.—G. H. Lewes

The Modesty of Genius

TRUE genius is invariably accompanied by an innate modesty, and those who have achieved the most are the least arrogant, the least elated about their accomplishments, always striving to attain to greater heights.

A notable illustration of this is found in the life of the immortal composer, Carl Maria von Weber, whose noble career contains many valuable and inspiring lessons.

He was the father of German song, the creator of the romantic opera, a marvelous pianist, as well as a gifted writer and poet; and he was also a kind, devoted husband and father who in spite of unfortunate early surroundings and influences became honored as a noble *man*—one who had succeeded in overcoming the faults of his youth and rising above previous failure.

After he had become one of the most popular and celebrated men in Europe, having met with phenomenal success in the presentation of his operas, he wrote to a friend:

How often the highest desires which I thought beyond my reach have been attained, and still the true, beautiful goal has arisen ever farther and farther away! And how little I satisfy myself in what has seemed to satisfy others! Believe me, high approval weighs like a great obligation on the honest artist's soul, and he never pays it, though he do his best.

At another time Weber displayed a similar spirit of humility when, on his return home from a concert trip, he discovered a laurel wreath in his trunk, which some admirer had lovingly placed there. Seizing it, he quickly adorned a bust of Mozart with it, saying, "This belongs to thee."

Generous soul! who thought not of his own personality, but paid tribute to the genius of others and to that glorious Divinity which is the source of all high inspiration. J.

NOTHING was ever learned by either side in a dispute.—Wm. Hazlitt

NEVER depend upon your genius; if you have talent, industry will improve it; if you have none, industry will supply the deficiency.—Ruskin

THERE is no real elevation of mind in a contempt of little things; it is, on the contrary, from too narrow views that we consider those things of little importance, which have in fact such extensive consequences. The more trouble it occasions us to be on our guard against small matters, the more need have we to fear negligence, to distrust our strength, and to interpose invincible barriers between ourselves and the least remissness.—Fénelon

THE CHILDREN'S HOUR

The Wild-Flower Garden

THE Lady of the Wild-Flower Garden is unusually busy these bright spring mornings, welcoming back her little friends, as they come up after their long winter rest. Her mariposa lilies, waving in the breeze, look like little white butterflies, the cluster lilies nod their purple heads, the yellow poppies blaze in the sun, and underneath the tiny rustic bridge the pretty ferns are uncurling their long green fingers. Here and there and everywhere one spies the familiar faces of smiling little flowers.

But something more has happened! Many a flower will wake up to find a new little companion by its side, for the Lady of the Wild-Flower Garden has been busy the whole year gathering many more little friends to live in her garden and make it beautiful.

Some of the plants will find that they have some duties which were not here last year; for the arbor has been built since they went to sleep and many of them must hurry and grow fast so they may hang their pretty vines and flowers upon it.

The bank which was covered with ice-plant a year ago, is now full of blooming plants, and down below it there lies a little pond where float the lily pads, and Easter morning saw a pure white water-lily bloom.

The little fish swim in the pond, and many birds come to bathe there every morning; linnets, toehes, and finches, chirping and twittering and splashing the water over the ferns and mosses growing along the bank. The humming-birds take their bath when the Lady sprinkles her flowers, darting through the spray or hanging suspended on vibrating wings, sometimes within six inches of her hand. Afraid? Not a bit. Lomaland birds have no fear of human beings.

Many other little creatures find homes in the garden, unmolested. The lizard and the horned toad bask in the sun along the path, while the great black beetle makes tracks with his feet in the sand as he walks along, and under a stone in the rockery lives a great fat common toad. The bees are busy among the eucalyptus blossoms, but they and the great black yellow-winged wasps are just waiting for the artichoke to bring forth its large thistle-like blossoms, so they may revel in the sweetness of its heart. And somewhere, unperceived by day, the little green cricket has found his home, and you may hear him chirping as soon as the sun goes down.

It seems as if each tree, plant, and flower were doing his best to tell the Lady of the Garden how much it appreciates her loving care, by growing and blooming in its very prettiest way, for I am sure that plants and flowers do really know when you love them. Are you not sure too?

THE DAISY

WITH little white leaves in the grasses,
Spread wide for the smile of the sun,
It waits till the daylight passes
And closes them one by one.

I have asked why it closed at even,
And I know what it wished to say:
There are stars all night in the heaven,
And I am the star of day.

Rennell Rodd

The Weavers

SILENT and thoughtful, Alice sat by the window, knitting a shawl for her grandmother. It was very large and it took a long time to get across one row. Suddenly Alice looked up, and said:

"Mother, do you know, I think that knitting a shawl is like living our lives."

"Why, how do you mean, Alice dear?"

"Well one knits and knits, row after row, and sometimes one makes a mistake or drops a stitch and it has to be raveled out and done over again; and sometimes it seems as if no progress is made; but we know that every stitch counts, and if we keep on, in the end all the stitches together will make a shawl."

"In the same way, we live, day after day, just doing about the same things apparently,

but within ourselves, we know something is growing, and our view of life gets deeper and broader, all so gradually we can hardly see any growth. Then we make mistakes and have to begin over again, but we know in the end, the sum total of all our days, even if they do seem the same, will make our lives."

"Yes, dear, and the Soul has a pattern for each of us to weave, and it *will* have the weaving right; and we have to do it over and over again until it is right, before we can go on; so the harder we try to understand the pattern and work it out right, just so fast shall we progress; so it depends on us whether at the end of our lives our days will have to be lived over again; for each must weave his own pattern, no one else can do it for us, and in spite of the many lives we waste, the Soul is bound to win out, and make us do our appointed tasks."

"Oh! when one thinks of it in that way," exclaimed Alice, "each day seems so precious, one does not like to lose a moment," and her fingers fairly flew over her knitting.

"It is the thoughts, even more than deeds, that are doing the weaving," said her mother.

AUDREY

Good Friends

IN the tree-tops and bushes and on the hillsides of Lomaland there is now a busy life. The air resounds with joyous twitter and song from all the little birds who are building their nests. Linnets, larks, and mocking-birds—they are all alike embodied little spirits of joy. "Twit, twit, twirrewit," sings the linnet in a eucalyptus tree outside the babies' bungalow, and the little ones, creeping around on the porch, answer, "Pee-eep, coo-oo-oo," and try to imitate their winged little friends as best they can. Mother Linnet loves the babies and often leaves her work to fly down and sit on the balustrade and watch them play. And in the evenings, when they sleep so sweetly in their little beds, you will often hear a fluttering sound over your head. It is only Mother Linnet, who has flown in through an open window. She flies all around the little beds and then out again. She just wanted to bid her little friends good-night. So you see, from their earliest childhood the Râja Yoga children learn to love all that lives; and I think that is why they always are so happy.

THE MYSTERIES OF THE HEART DOCTRINE

PREPARED BY
KATHERINE TINGLEY
AND HER PUPILS

The Theosophical Book *of the* Twentieth Century

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

ORDER FROM THE
THEOSOPHICAL PUBLISHING CO., POINT LOMA, CAL.

Isis Conservatory of Music OF THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY POINT LOMA, CALIFORNIA

Personal applications and inquiries received every Saturday
by the Secretary at SAN DIEGO BRANCH

SOME OF THE ERRORS OF CHRISTIAN SCIENCE CRITICISM

BY H. P. BLAVATSKY AND WILLIAM Q. JUDGE

CONTENTS

"The Empty Vessel Makes the Greatest Sound"
A Note of Warning

—by H. P. Blavatsky

Of "Metaphysical Healing"
Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by William Q. Judge

A MOST VALUABLE PAMPHLET. Outside of Theosophy there is given no adequate explanation of the healing that is at times accomplished, nor of its *rationale*, nor of the ultimate price that must be paid and the dangers connected with such practices.

This pamphlet is invaluable to all students.

COMMUNICATIONS
Communications for the Editor should be addressed to "KATHERINE TINGLEY, Editor CENTURY PATH, Point Loma, California."

To the BUSINESS MANAGEMENT, including subscriptions, address the "New Century Corporation, Point Loma, California."

MANUSCRIPTS
The Editor cannot undertake to return manuscripts; none will be considered unless accompanied by the author's name and marked with the number of words.

The Editor is responsible only for views expressed in unsigned articles.

CENTURY PATH

WEEKLY ILLUSTRATED

Edited by KATHERINE TINGLEY

NEW CENTURY CORPORATION
Point Loma, California, U. S. A.

Entered January 11th, 1907, at Point Loma, California, as second class matter under Act of Congress of March 3rd, 1879.
Copyright, 1909, by Katherine Tingley.

SUBSCRIPTION

By the year, postpaid, in the United States, Canada, Cuba, Mexico, Porto Rico, Hawaii, & the Philippines, FOUR DOLLARS; other countries in the Postal Union, FOUR DOLLARS AND FIFTY CENTS, payable in advance; single copy, TEN CENTS.

REMITTANCES

All remittances to the New Century Corporation must be made payable to "CLARK THURSTON, Manager," and all remittances by Post-Office Money Order must be made payable at the SAN DIEGO Post-Office, though addressed, as all other communications, to Point Loma, California.

The Atomic Theory

WITH regard to the atomic theory of matter, it is sufficiently well known in a vague and general way that it states that matter is composed of exceedingly minute particles, separated from each other by very small (but relatively large) intervals; and that while physics does not concern itself much with distinguishing atoms into different kinds according to their constitution, chemistry distinguishes between atoms and molecules. The atom is the smallest portion of an element in which the properties of that element can inhere; and the molecule is the smallest portion of a compound (or element) that can exist independently, further subdivision resulting in a separation of the molecule into its constituent atoms.

But many people would be at a loss if required to give grounds for the acceptance of this theory, and to cite facts supporting it and indicating the probable size of the atoms. Professor J. J. Thomson is giving a course of lectures on the properties of matter at the Royal Institution, England, and the first lecture, as reported in *Engineering*, is briefly as follows.

A Cautiously Indefinite Theory

Matter is built up of an extremely large number of very small particles, separated by a medium differing entirely from these particles in its properties, which medium was known as the ether. [Note the alternative to saying "separated by spaces."] What led to this theory was the fact that bodies can be compressed, which is explained by saying that the particles are pushed closer together. Again, the fact that bodies can sometimes interpenetrate one another can be explained by the same theory.

To illustrate this interpenetration the lecturer took a vacuum bulb, having a branch to it in the shape of a platinum tube. This tube was heated in a Bunsen flame and hydrogen passed through the incandescent platinum into the vacuum, its presence being demonstrated by the altered character of an electric discharge sent through the vacuum bulb. In a similar way sodium can penetrate glass, and is often used in this way by being sent through the side of a vacuum tube in order to absorb the last traces of oxygen within. Quite recently it has been proved that other elements can find their way through glass, a circumstance which has influenced the accuracy of delicate experiments designed to ascertain whether there was any change of weight during chemical combinations, when these experiments were conducted in glass vessels. Hydrogen can penetrate

Interpenetrability of Matter now Established

Hydrogen can penetrate

a considerable thickness of iron, even in the cold. These facts show that matter behaves like, very much like, a sieve.

If we try to divide matter to such a degree that it loses its properties, we find that the ultimate particles must be exceedingly small. [It is not definitely stated here whether he means dividing one kind of matter until it ceases to be that kind of matter and becomes another kind of matter, or dividing matter until it ceases to be matter; but the experiment next quoted indicates the former meaning.] Faraday obtained gold leaves only the one-tenth-millionth of an inch thick, but they still showed all the properties of gold.

Subdivided out of Existence

The duration of scent from some substances, such as musk, without appreciable loss of weight during years, is an argument in favor of minute divisibility. Strutt has recently shown that by means of the spectroscope it is possible to detect the presence of neon in one-twentieth of a cubic centimeter of air, of which neon constitutes one-hundred-thousandth part by volume. But here the professor incidentally remarked, on grounds not stated, that this quantity of neon contained 10 million million molecules, so that the spectroscope is not so very delicate after all. He also said that while this number of particles was about the smallest number of non-electrified particles that could be detected, a single particle could be detected when electrified.

Tait had given an illustration where either the calculations of physicists as to the size of atoms, or else the homeopathic theory of medicine breaks down. Homeopaths claim efficacy for medicines of the "twelfth dilution"; physicists say that the seventh dilution might still contain one or two molecules per cubic centimeter, but in further dilutions the chances were against any particle of the medicine being found in a given cubic centimeter.

Oil on water will thin itself out indefinitely, owing to the attraction of the water for the oil being greater than that of the oil for itself; the film might be only one-millionth of a millimeter thick and still show the characteristics of the oil, but beyond that the characteristics were lost.

In commenting on the atomic theory, one may repeat the somewhat trite remark, that while it may be convenient to regard larger masses as being made up of an aggregation of smaller masses of the same substance, this is of no use as a final explanation. For, if the characteristic properties of matter are to be attributed to, or defined in terms of, its

atomic structure, then of course we must not attribute any of those properties to the atoms themselves. Hence we can form no conception

of what the properties of an atom may be. This point is brought out in connexion with recent researches into finer grades of matter, which

led to the conclusion, as has been stated by some scientists, that the energy of a moving particle is not always proportional to the product of its mass and the square of its velocity; and which suggested the idea that mass (or inertia) itself is a dynamical function—though of what compounded, goodness only knows. Even if we thus resolve mass into an energy resulting from the movement of something else, it is necessary to postulate that something else; in short, we must have a unit or rudiment somewhere.

We might analyse a crowd of people into separate people, which would correspond to physical atoms. Further subdivision would result in the destruction of the individuals, and we should get arms and legs. Still further analysis would yield blood and bones, then particles of matter, and so on. Science can analyse down to the limits of its powers

of observation. After that, if it still continues to analyse in its imagination, it will make mistakes. The rudiment of matter, its final substratum, the unit of materiality, that substance whose motions give rise to all the properties of matter, cannot possess any of these properties and must *ex hypothesi* be immaterial—that is, beyond the domain of physics. Physicists cannot find it; if they could, it wouldn't be it—to perpetrate a bull. They must predicate it and accept it as the ultimate physical axiom. Any inquiry into its nature belongs to some other department of research.

E.

The Universe Alive

THE way in which the teachings of Theosophy and of H. P. Blavatsky in *The Secret Doctrine* are now being brought forward as original ideas conceived by other people, and without the slightest acknowledgment or reference to Theosophy, is daily becoming more amazing. The philosophers have simply been compelled to accept these teachings, and the best way in which they can save their face and avoid eating their own words, after condemning H. P. Blavatsky and Theosophy, is to put forward the teachings as their own.

In the *Sunday American* there recently appeared an article by an astronomer of national reputation entitled, "Is the Earth Alive?" in which the views of Theosophy and the teachings of *The Secret Doctrine* are set forth (with modifications). But there is no acknowledgment, and the views are stated to have been "first developed" by Fechner and now restated by Professor James in the *Hibbert Journal*.

The earth is a great conscious Being, and we men are its organs, much as the cells in our body, though in a sense separate lives, are part and parcel of ourselves. The earth looks like so much dirt to us because we are on a so much smaller scale; but then the particles of our own body or brain may look like that

to the animalcules that live therein. The atoms of earth are not all there is; between the atoms is ether, traversed and filled with innumerable forces and qualities, amply sufficient to make an organism for a great soul. "If the heavens are the abode of angels, then the heavenly bodies must be those very angels, and the earth is one of them."

This teaching is of the greatest antiquity, being a cardinal tenet of the Secret Doctrine; hence it may be found in the sacred writings of all ancient races. The various ancient Hindû systems, for instance, are built on it. All those beings which we call "gods," foolishly comparing them with our own theological notions of a god, what are they but the great intelligences and powers of the universe, which include in themselves the minor beings? We have no such teaching of our own; we have only the crude conception of a single deity, a conception worthy of ignorant savages; and we try to fill in the gaps with abstractions derived from physical science. Thus we have a few "gods" or fetishes, which we designate "gravitation," "affinity," "energy," etc. But ancient science recognized the fact that forces and qualities can be but the attributes of Beings, and that Nature and the Universe can only reasonably be conceived of as a great Soul, including in itself countless lesser souls. Fechner did not invent this doctrine, nor can Professor James claim any originality or any priority in setting it forth.

If one finds any difficulty in imagining how the earth, which has a physical body, can be a soul, is not the difficulty precisely the same as in the case of our own body and soul? What is the connexion between our physical body, with its atoms, and our conscious self? Who can explain that? We need to postulate, as intervening between the physical and the soul, various grades of existence or substance, of varying degrees of materiality—grades now summed up vaguely under such terms as "ether." If in some mysterious way a mind and will inheres or dwells in our physical frame, why can they not inhere or dwell in the earth? Why is one structure better adapted for this purpose than another?

And all attempts to account for the universe on any other theory than that it is a conscious intelligence are doomed to failure. Failing to postulate this, we have to devise all sorts of lame explanations which, in their essence, are really the same thing. We have to coin such words as "force" and "affinity," which in reality must be conscious intelligent beings, since they manifest all the properties of such.

H. P. Blavatsky, all through *The Secret Doctrine*, contends for this view, pointing out the absurdity of the conclusions reached by those who try to explain Nature on the theory that it is inanimate and to account for the behavior of the celestial bodies on the assumption that they are merely masses of physical matter revolving in accordance with the laws of physical dynamics. She explains that the globes are the bodies of Planetary Spirits, and that their motions are regulated by intelligences which cannot err (in our human sense) and are purposeful. Every function in the universe, from those of the stellar bodies down to those of the most apparently inert stone, is the manifestation of living conscious intelligence, the expression of mind and purpose. There is no other reasonable explanation,

and science must eventually come round to this view, as it is indeed already doing in many instances.

But the great teachings of the Secret Doctrine are not to be played with. Knowledge entails responsibility. If these teachings are to be followed up consistently, it means that we must model our lives according to the wisdom these teachings reveal and inculcate, otherwise we shall be blatant hypocrites and our knowledge will become a curse to us. As long as we remain in ignorance, we have some excuse for not living up to the highest ideals; but one who aspires to know the deeper secrets of life must make good, and square his practice with his precepts. Hence anyone who tries to utilize the teachings of Theosophy as a means of running a school of philosophy, and who does not identify himself with the broad humanitarian aims of Theosophy, is on a side track and simply will not succeed.

STUDENT

Are Other Worlds Inhabited?

IN answer to this question two propositions occur to the mind as being reasonable:

(1) that other globes are inhabited, for otherwise we must suppose our own little globe to be the only inhabited one; (2) that the inhabitants of other globes can not be exactly the same as those of ours, because the conditions are different.

Camille Flammarion writes a letter to the *New York Herald* on this subject. He quotes a German professor who has recently argued against the habitability of other worlds, saying life can only develop between 0 and 40 degrees Centigrade, as blood coagulates above the higher temperature and water freezes below the lower. But Flammarion very truly points out that this only amounts to saying that life can be terrestrial nowhere else than on the earth; it is absurd to consider our planet as a type of the universe and argue that its kinds of life are the only kinds.

H. P. Blavatsky, in *The Secret Doctrine*, shows that man need not be physical, and that in past periods of evolution ethereal human races have existed, independent of physical conditions. She quotes Dr. Whewell (from memory, but almost literatim), in *The Plurality of Worlds*, to the effect that.

No Christian ought to believe in either the plurality of worlds or the geological age of the globe; because, if it is asserted that this world is only one among the many of its kind, which are all the work of God, as it is itself; that all are the seat of life, all the realm and dwelling of intelligent creatures endowed with will, subject to law and capable of freewill; then it would become extravagant to think that *our* world should have been the subject of God's favors and His special interference, of His communications and His *personal* visit. —(*The Secret Doctrine*, Vol. II, pp. 149, 150.)

Is it not neatly put? Now what is the answer?

STUDENT

Antarctic Auroras

SINGULAR auroras were observed during the voyage of the *Discovery*. The glow frequently takes the form of a bow, which then lifts and is followed by another and another until, after a succession of them, they are replaced by innumerable vertical lines of light. These then take the form of immense moving curtains, the lower edges being strongly defined. Then they are drawn up into an arch! J.

Some Views on XXth Century Problems

The Third Degree of Life

IT is not always the small men who know little of human nature. And just as the small men see in others their own weaknesses and smallness, so the large see their own largeness. Tolstoy, certainly one of the latter, looking backwards and forwards upon his own inner growth, regards its stages as normal to present humanity.

In the columns of a contemporary he tells us:

In the first stage a man lives only for himself, for his passions and impulses; for eating and drinking; for passing the time merrily; for hunting and for female society; for ambition and vanity.

This outgrown, there follows the stage of devotion to the interest of humanity. In him, he says, it was marked by energetic work in founding elementary schools.

All my religious sentiments became concentrated in the happiness of others and on the accomplishment of the kingdom of heaven on earth.

This gives place to the third, marked by aspiration for the divine, for "a new attainment of life," for divine purity, for the attainment of God, for "a purity of divine Being in myself and in my own life."

In the passage from the first to the second there was a deadly blank as he realized the real joylessness and worthlessness of the pleasures and aims with which he had at first occupied himself. Then he found that by devotion to the welfare of humanity as he saw it he could make life once more interesting and worth living.

I found peace the moment I had found a religious sentiment impelling me to think of the good of humanity. In this thought, at the same time, I found full satisfaction of my desire for personal happiness.

A similar blank, on another plane, occurred between the second and third stages. It was acutely marked in the life of John Stuart Mill. But he, of course, had no first stage corresponding to Tolstoy's, and a very shadowy and incomplete representation of Tolstoy's thoroughly mystical third.

The blank was as it were the question, Why? Why work for humanity? For Mill it was a deadly question for which he never had a perfect answer. With Tolstoy the question was not so much, Why work for humanity? as, Is the work I am now doing *good* for humanity? He had not to cross that gulf in which the word *good* threatens to lose all meaning. He finds the good of humanity included in, rather than constituting, his new aims.

Preparing for the new life, I attain at the same time my former aim, the good of humanity, more surely than when this was my only aim. Aspiring to attain God, aspiring to a purity of divine Being in myself and in my new life, I find more assuredly both happiness for humanity and for myself.

In other words he is trying to find in himself, to come into knowledge of and conscious communion with, that which in his second stage inspired him with the desire for the good of humanity. This, he says, is not the aim for the perfecting of self; still less would it be the aim for "salvation." These, after all, are selfish: "No, it is something else. It

is an aspiration to divine purity." As a Theosophic manual says:

The way is to be sought for its own sake, not with regard to your feet that shall tread it.

In dropping self, and trying daily to feel as *the divine Presence feels*, love of humanity is necessarily born; for compassion is the essence of that.

Would that Tolstoy were right in crediting to all men, as normal stages, his second and third. In how many is not the second altogether absent, and the third a mere transmutation of the first in the persisting crucible of self.

STUDENT

Physical Culture

MEN would take more care of their bodies if they recognized that they had to live in them again, facing the results of all their hygienic misdeeds. Reincarnation is passing into the popular mind; men are beginning to think it possible that they have been on earth before. But that they have been on earth in the same bodies as those which now clothe them, will be a new idea.

A man weighing say 160 pounds will eat and drink his own weight every fifty or sixty days. Most of this passes through quickly, is used more or less on its way, and returns to nature. It never strictly speaking formed a working integral part of the body at all. But a certain minute fraction of it does, and the atoms of that fraction were attracted to that man because they belonged to him before; they were his body before and they become his body again. This very old doctrine is thus put by H. P. Blavatsky:

Occultism teaches that (a) the life-atoms of our (*Prāna*) life-principle are never entirely lost when a man dies. That the atoms best impregnated with the life-principle (an independent, eternal, conscious factor) are partially transmitted from father to son by heredity, and partially are drawn once more together and become the animating principle of the new body in every new incarnation of the Monads. Because (b), as the *individual Soul* is ever the same, so are the atoms of the lower principles (body, its astral, or *life double*, etc.), drawn as they are by affinity and Karmic law always to the same individuality in a series of various bodies, etc., etc. (*The Secret Doctrine*, vol. II, p. 671)

In their way they are conscious, and they are stamped with something of the thought and feeling of the man who used them before. In their new groupings they gradually follow the tendencies to health or disease set for them by his previous use or non-use of his will.

This does not mean that if he had a big biceps before he will have one again. It means that if he lived sanely and sanely cultured the physical as one of the three aspects of his nature, controlled and guided it, so that it became a balanced and harmoniously working whole, that balance and harmony on its new assemblage it will tend to resume, helping its owner to the resumption of his former wisdom of life. But that health which in defiance of wisdom was spuriously maintained by medicine, Spas, baths and the like adventitious means, a self-indulgent and sensual life running on underneath this, will work out in a new incarnation as it would in the old if none of the remedial measures had been adopt-

ed, the Karmic bill being of course very heavy. And conversely a congenital ill-health which had been wisely met and palliated by the best measures available, by equanimity and self-restraint, would mean the development of a current of good health underneath it, manifesting as such in the next birth.

In a sentence, we re-assemble our old instruments, in some degree resharpened and refreshed for us by nature, but in greater degree as we left them.

STUDENT

Psychic Drinking

A MEDICAL writer in the *Journal of Inebriety* makes a very common confusion between two almost distinct kinds of drug-takers. He says:

From a medical standpoint a careful study of inebriety must of necessity be a study of indigestion . . . when the digestive apparatus is performing its functions normally there is no distress and consequently no call for drugs [narcotic drugs, alcohol, morphine, and so on].

There certainly are those whose drug cravings, even when they know it not, depend upon some deep disturbance of digestion or assimilation or excretion. It may be that in its early stages the cravings, when real cravings, are always of this kind.

No one is quite healthy; a certain amount of inner disturbance goes on in everyone. One of the drugs either allays this or sinks it out of sight below the level of consciousness. Then there may be the temporary sense of perfect health, naturally extremely pleasurable—physically pleasurable and pleasurable to the psycho-mental nature, but to be paid for subsequently.

On its way to ruin the body will develop a craving for this pleasure. As we have seen, the craving rests on physiological inadequacy somewhere; if that can be put right medically, the cravings may then disappear.

But the drugs do something more than create a temporary imitation of health. They cause a subtle breaking down of tissue attended with the liberation of energy. The liberation is morbid and the flow can be used by the psycho-mental nature of certain people for the induction of pleasurable states. These are ruinous and depend upon ruin, but that is disregarded. And it is the cravings of such people, once established, that will be but little helped by medicine alone. The habit is now their conscious demon, almost never still; and at last they know themselves for its victims. Pleasure, *for them*, is at an end.

Theosophy moreover teaches that this entity, once created, may outlast the interval between two incarnations. It is re-awakened to activity by the very first contact of its victim with his drug. He is only safe in a total abstinence continued from his earliest years. This constitutes a class of inebriates of which the medical profession has no suspicion and which they do not know how to treat. For in addition to what they now do for him, the patient has to be awakened to a consciousness of his divinity, of his latent power to subdue anything of any strength in his nature, of his soulhood in a word.

Archaeology

Palaeontology

Ethnology

Prehistoric Wonders of Wyoming

THE following is condensed from an article in *Records of the Past*.

In Eastern Wyoming lies a vast ancient quarry section, now locally known as the "Spanish Diggings." Wyoming is but little known to the Eastern States and Europe, though having some fame on account of its Yellowstone Park and immense fossil beds; in fact an archaeologist has designated the foothills and plains as "darkest archaeological America."

The region in which is the largest collection of quarries is even today one of extreme wildness, given over to wild range-cattle and predatory animals. But there is conclusive evidence that there was a vast population here. No section of the entire world can show quarries of such size as the "Spanish Diggings." The great central plains rise from an altitude of about 1000 feet at the Missouri River to 5000 feet. The country has a level prairie aspect, with breaks and cañons, lofty sand-hills, buttes, and mesas; it is composed of tertiary strata, chiefly the Bad Land clays and Loup Fork sands. As one travels westward, the mountains seem to rise abruptly out of the level plain. West of the steep and rugged Rawhide Buttes the ancient quarries begin, covering a territory of about 15 by 40 miles.

Here every hillside, where the material would warrant, shows prehistoric quarries; every level spot, crowded stone *tipi* circles; and every summit, shop sites. Such an array of beautifully-colored quartzites, jaspers, agates, and moss agates probably is unknown elsewhere. There is exquisite barbaric splendor in some of the rock colorings, there being every tone, tint and shade to suit a savage taste; [why a *savage* taste?] white, gray, lavender, violet, purple, pink, red, vermillion, red and white mottled, striped and banded; light yellow, brilliant yellow, dark yellow, light and dark browns and black. There are no such beautiful quartzites in any other part of this country. . . . In addition the quarrymen worked flint, agates and chalcedony of many colors.

Quarries innumerable are everywhere for miles; tons of chips, cores, and implements abound; the blocks taken from the quarries were carried to a convenient site and there wrought, as the chips testify. Thousands of great hoe-like implements are found, which were probably not quarry tools, but tools made at the quarry. There are granite wedges, mauls of granite or quartz or diorite, scrapers of jasper and flint and quartzite.

As to the people who used these quarries, they must have been extremely numerous, to judge by the number of *tipi* rings and the vast amount of work done. Apparently, too, some of the implements found here were agri-

Lomaland Photo. and Engraving Dept.

MENHIRS DU MOULIN, SAINT-PIERRE-DE-QUIBERON, BRITTANY

cultural. But the writer of the account is unable to conjecture how so large a population found use for hoes or obtained sustenance in such an arid region; water is scarce, there is no wood, and the country cannot be entered at all without a guide. But we may ask, "Was the country always arid and barren?" Or have we here one of those cases where the hand of Destiny, using perhaps as its agent the carelessness of man, took away the wood and so the water? Did this great people live in a fertile region and gradually desolate it by denuding the earth, building great cities, and leading a prodigal life?

Again, why were they barbarians? The hypothesis seems not to have been inferred from the facts but to have been created beforehand. The facts seem rather to show that they were cultured experts. STUDENT

Effect of Stein's Discoveries in Central Asia

THIS is what the London *Spectator*, the same paper that said Jesus invented compassion, says after Dr. Stein's lecture on his discoveries in Central Asia:

In a sense the age of exploration is only beginning. . . .

Shall we, then, range ourselves with the rustic intelligence which supposes that the early writers on classical literature and the Scriptures knew more of their subject than we know today because they lived "nearer to the time"? . . .

After Dr. Stein's lecture . . . one feels that long vistas of ethnographical knowledge open before us. The days will assuredly come when boys and girls will no longer be taught, as we have all been taught, a blurred story about the vague Asiatic tribes from whom modern races are descended. . . .

It seems as though he fished out something from the sands of Chinese Turkestan almost wherever he put in his hand. The sand has at once demolished

and preserved the country. . . . The shroud of sand lies gently on the records of the past as though it loved them, and no decay reaches them . . . when once a thing is buried it is safe.

And this is what H. P. Blavatsky said 21 years ago:

According to the same tradition the now desolate regions of the waterless land of Tarim—a true wilderness in the heart of Turkestan—were in the days of old covered with flourishing and wealthy cities. . . . The same tradition speaks of immense subterranean abodes, of large corridors filled with tiles and cylinders.—*The Secret Doctrine*, vol. 1, p. xxiv.

The oasis of Cherchen, for instance . . . is surrounded with the ruins of archaic towns and cities in every direction. There, some 3000 human beings represent the relics of about a hundred extinct nations and races—the very names of which are now unknown to our ethnologists.—*Ibid.* p. xxxiii.

Built deep in the bowels of the earth, the subterranean stores are secure.—*Ibid.* p. xxxii.

STUDENT

Menhirs du Moulin

THESE menhirs are the remains of alignments which have been destroyed chiefly by the encroachment of the sea. Fallen stones can be traced right down to the beach, and even seen on the rocks beyond at low water. As far as can be judged from the fallen stones, there appear to have been five lines of menhirs, terminating in a cromlech or circle.

The 21 menhirs which now remain standing form a very striking and remarkable group, on account of their grotesque shapes and considerable size. One in particular, which will be easily recognizable in the illustration, looks like a rude statue of a gigantic man; it is known locally as "Le Moine." B.

✻ The Trend of Twentieth Century Science ✻

The Gaps of the Ladder

SIR RAY LANKESTER, writing on the *Mammalia* in a popular English newspaper, brings a weak place—one of several—in the zoological chain into view. According to the current teaching the chain of forms from the simplest up to the most complex, is continuous. At the bottom is the amoeba; at the top, man. All the grades develop gently out of each other. Of a large number of the grades we have living or fossil representatives; but here and there are gaps. One of such gaps at the upper end, is popularly supposed to be waiting for the discovery of a missing link between man and monkey.

One of the difficulties of the theory is the gaps, for one of which Haeckel once invented an animal; another is the fact that we have never yet seen natural selection and variation actually transforming one species into another.

It is a gap, or at any rate a weak place, that Sir Ray Lankester brings into the view of his readers—the gap in the *mammalia* (animals that suckle their young) between those with and without placenta—the organ by which the young are nourished before birth, growing from the embryo and coming into contact with the circulatory system of the mother. Another gap, though not so marked, below the mammals, between them and the reptiles, is also touched upon.

An egg is of course alive; but when a biologist speaks of live-born young, he means that the egg stage has passed by the time the young are born. In the case of reptiles and birds, eggs are laid, hatching occurring later. The next step higher up the scale is occupied by the mammals. In their case birth and hatching are one and the same process. And the young, as soon as born, are fed from the mother. This gap between mammal and reptile, might be regarded as filled by animals which, although laying eggs, subsequently suckled the hatched young ones. Of such, only two kinds are known, both Australian, the Duck-bill and the Spiny Ant-Eater.

Sir Ray Lankester says:

There must have been a whole legion of varied animals like them, intermediate between the Placental mammals and the reptiles—but it is a disappointing fact that at present we have not discovered, as we may yet hope to do, the fossil remains of these primitive reptilian mammals.

The filling of the gap, like that between vertebrates and invertebrates, is thus exceedingly scanty. Now for the other, the gap in the mammalian order. It would be filled by animals in which, though hatching and birth were the same event, before birth the young were nourished as eggs and not by means of the special organ known as the placenta. Until recently it was thought that the pouched animals, Marsupials, filled this gap:

Now, however, it has been discovered that the Marsupials have, many of them, a small but genuine placenta. . . . Accordingly, it is considered more probable that they are not an intermediate stage, but a side branch or line of descent from early placental mammals, and that they have to a greater or less extent lost the placenta. . . .

So the gap reopens.

Theosophy gives the reason for the gaps, for the slender fillings, and for the reopenings. It teaches that at the beginning of our present period of evolution there pre-existed a number of ideal animal-root-types which passed slowly into physical manifestation. Once these appeared, variations began on both sides of each, spuriously filling or partly filling the gaps. In H. P. Blavatsky's words:

Those purely *secondary* causes of differentiation, grouped under the head of sexual selection, natural selection, climate, isolation, etc., mislead the Western Evolutionist and offer no real explanation whatever of the "whence" of the "ancestral types" which served as the *starting-point* for physical development. The truth is that the differentiating "causes" known to modern science only come into operation after the physicalization of the primeval animal root-types out of the astral. (*The Secret Doctrine*, vol. II, p. 648.)

Vegetarian Pitfalls

THE opinion of a man who has tried or is trying vegetarianism is often worthless. In the second case he is under the stimulation of something new; enthusiastic friends are backing him up; he is reading enthusiastic and confident literature. Faith, in fact, is at work. His opinion may become of worth when these adventitious aids have departed.

But it may not. Many have tried vegetarianism and renounced it, thinking it a mistake. Before accepting their verdict one wants to know exactly what they tried. Were they, for instance, burdened with the conviction that the absence of meat must be met by the presence of large quantities of legumes, peas, beans, and the like; and by cheese and eggs? Did they, though departing from meat, remain nitrogen worshipers? Did they eat a great deal too much? And so on.

A number of recent experiments, summarized in *La Revue Scientifique*, shows that abstinence from meat increases endurance in work.

The meat eater has usually a larger output of uric acid than the vegetarian. The sense of fatigue is due to a fatigue toxin in the muscles and nerves. Is uric acid this toxin? According to some physiological chemists it is. Others think not; it tends to thicken the blood and throw therefore more work on the heart; to this they ascribe the earlier fatigue of the meat eater. Others, including the greatest authority, Haig, point to the fact that in the meat the eater is getting a dose of its fatigue toxins, is as it were consuming a dose of tiredness with his food. And again, meat in addition to its food value is a general stimulant causing a development or rather expenditure of energy in excess of what is necessary for the work and therefore involving a superfluous production of fatigue toxin.

That uric acid is one at any rate of the fatigue toxins, or related to one of them, is suggested by the fact that too much legume food may make muscular work very difficult, may bring on fatigue very early, and may even bring it on before work has been begun. These foods contain chemical bodies closely related

to uric acid, and unless the digestion of them is very perfect there will be trouble.

The practical moral of the matter is that the legume eater should regard his beans and peas and lentils as very concentrated nourishment, needed in small quantities only, to be fully masticated, and to be accompanied by juicy vegetables or fruits. The juices of these will give the salts which the legumes need for their digestion, assimilation and excretion. It is also exceedingly injudicious to include any thing sweet, or any other markedly nitrogenous food, in a meal containing legumes. The man who eats meat, legumes, cheese, and sweets at the same meal had better spend what energy remains to him in walking round to the doctor.

The Sixth Sense

A WELL known physiologist, writing in *Umschau*, discusses the senses of the blind, concluding that some of them have or use one more than ordinary people. Perhaps all of them have it, and all the rest of us too; the use of it lying in the mental power of paying attention to it. This power is indeed the real sixth sense, the understanding reception by the mind of what has previously been received by the sense organs.

The special sense of the blind has as yet no name; its work is to perceive the neighborhood of solid objects. It does this work in total darkness, and when the eyes are blindfolded. Nor is it connected with hearing, for the deaf have it and those whose ears are entirely blocked. It is not a temperature sense, for it works when the objects are of the same temperature as that of the air. The blind themselves, or those who have it, place it in the forehead, between and a little above the eyes. It seems possible that it is some refinement of the sense of smell. Matter emits all kinds of vibrations into the ether upon which we use the senses of touch, smell, taste, hearing, sight; and there may be some between these, as well as below and above them, to which we are insensitive. All the senses are ways of touching vibrations.

The Earth's Tides

M. FLAMMARION has replied to the South African reply. He said there were two daily tides in the earth's crust, corresponding to those of the waters, a rise and fall of eight inches.

To this, as we have already noted, the Kimberley people replied that the tide was not lunar but solar, that it was much more than eight inches, that it was once a day and not twice, and that there was also an annual one.

M. Flammarion answered that the daily tide, due to solar heat, was already well known. It was the difficulty in eliminating it from observations that prevented the double lunar tide from receiving earlier recognition.

It now remains to show that there are crustal *high* tides corresponding to those of the waters and with the same cause; and then, perhaps, that they cause earthquakes to be more frequent or more severe.

Miniature Oaks

WANDERING through the great variety of shrubs which constitute the chaparral or brush covering the wilder portions of Point Loma, the nature-lover occasionally finds a Lilliputian grove which, when examined closely, carries him in imagination to the stately forests of oak for which other portions of the State of California are noted. These miniature groves are composed of perfect little oak trees, though they are not more than three or four feet high. One of the largest groups of these dwarfs lies about a mile north of the International Headquarters of the Theosophical Movement. Their ancient trunks—for they are quite aged—are gnarled and mossgrown as those of the primeval forest, yet only a few inches in diameter, and their acorns are quite perfectly formed. Many of their branches are covered with the parasitical oak-apples too, for as the monarchs of the forest are famous for their hospitality to a world of insect life, so their dwarf representatives are generous in providing sustenance for many kinds of larvae.

These tiny oaks are little larger than the dwarf trees the Japanese cultivate with such extraordinary results, but they have received no attention from man. Though a rarity at Point Loma, these Scrub Oaks (*Quercus dumosa*) make up a considerable proportion of the chaparral of Southern California. STUDENT

A Pastor and his Prey

THE following story in the form of a Biblical parable is sent by a correspondent who vouches for the facts:

And it came to pass that in the city by the great western sea, which, by reason of its exceeding wickedness had been sorely scourged by the gods by fire and by violent quaking of the earth, there was a wealthy congregation whose pastor, a follower in precept of the Master of Compassion, was a man of mighty arms and exceeding skillful in the use of weapons of destruction—even of those that do vomit a kind of hellish brimstone and leaden hail.

Now, one of the elders of the congregation having perceived in the pastor and follower of the Master of Compassion one who like unto himself was given to the lust of blood, did solicit him to traverse the coast parts in quest of victims for their weapons so terrible.

And they did go forth upon the evening before the seventh day unto the quiet waters where lay the feeding-places of the water-fowl of beautiful plumage, where the servants of the elder had laid much lure of food. Whereupon, upon the seventh day, the mighty hunters did cause the death of many of their prey and did rejoice that they did "get the limit."

And it came to pass that the elder, being exceedingly glad in observing the skill in slaughter of the pastor and follower of the Master of Compassion, did desire to give a gift in token thereof: whereupon he caused his maker of weapons to send unto

Lomaland Photo. and Engraving Dept.

MINIATURE OAKS AT POINT LOMA, CALIFORNIA

the house of the pastor and follower of the Master of Compassion, one of his most skilfully wrought and deadly arms. And there was great joy when the gift was received.

Of course this pastor, if questioned, would vindicate his conduct by alleging that the killing of animals is not forbidden. But according to that reasoning, we must infer that people whose compassion prevents them from killing animals are not better, but merely more eccentric, than other people. Otherwise we have to conclude that the human conscience has a law higher than that preached by Christianity. It is safe to say that when questions of compassion become the subject of argument, there is no real feeling of compassion; its spirit has not been grasped, and it has merely been accepted as a precept to be obeyed under protest and escaped from if possible. Does not the taking of pleasure in the slaughter of animals argue a lack of appreciation of the unity of life and a lack of sympathy with our fellow-creatures? And does not this lack of feeling portend the possibility of a similar insensibility with regard to one's human fellow-creatures? In any case, if we are content to accept the morals of an order of civilization in which animal slaughter would be considered permissible, we must also be content to keep down to that level in other respects, otherwise we are guilty of consummate cant. People are looking for clergy whose conduct will be more consonant with the dignity of their calling. TRAVERS

A New Element

M. OGAWA, of the University of Tokio announces the discovery of a new element, to be called Nipporium from the land of its discovery. The atomic weight is ascertained to be about 100 and it seems to fall into a gap in the chlorine group (in Lothar Meyer's table) estimated at 99. It occurs in thorite, reinite, and molybdenite. In thorite it occurs as small yellow or red crystals hard enough to scratch glass and consisting of a double silicate of nipporium and zirconium.

These evidences of mathematical series of chemical elements, of planets, as in the case of Bode's law, and of color and sound vibrations, etc., are all of great interest as tending to show the progressive laws underlying all nature. Will some future scientist not rebel against the water-tight compartment system of science and show us the details of the way to realizing a little more fully that all nature is one, and that one mighty law underlies all manifestation? Then religion and science and philosophy will be all one and we shall have the Secret Doctrine, which is the synthesis of all these, brought closer to the life of humanity. The Path has been indicated by Theosophical Teachers. It is for others to follow it in its details step by step. M.

New Plants for Cold and Arid Regions

A PROFESSOR of the South Dakota Agricultural College has been traveling in the north of Asia, investigating for plants that will grow in cold or arid climates. He has brought back some new varieties of Arctic alfalfa, a grape that will grow in places almost arid, and a clover that sprouts in the winter and will even grow through ice. He found alfalfa growing in Asia at a place where the temperature was 60 and 75 degrees below zero. The United States Agricultural Department intends to acclimatize these plants to the cold and semi-arid parts of this country. STUDENT

The Tree and the Tomb

IN the churchyard of Tewin in Hertfordshire, England, is a tree, divided into two or three main trunks, which grows straight out of the tomb of a noble lady who died over two centuries ago, and which has rent her sepulcher into pieces. It has wrapped itself around the iron railing which used to guard the tomb, so that the tomb is practically hidden within the tree. The story goes that this lady used to deny the resurrection and vowed that she would have a tomb that could not be rent! What she could want with such a tomb, if she did not believe in the resurrection, passes comprehension. T.

Brotherhood, a Fact in Nature

(Read at a meeting of the Young Men's Club of Lomaland)

This organization declares that Brotherhood is a fact in Nature.

The principal purpose of this organization is to teach Brotherhood, demonstrate that it is a fact in Nature, and make it a living power in the life of humanity. (From the Constitution of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY)

THE real intent and meaning of this main object of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY is definite enough, though some questions have arisen as to the meaning of the words "a fact in nature." Some seem to have taken this to mean that Brotherhood is the *only* fact in nature; and so have imagined that by showing that there is also unbrotherliness in nature, they thereby called in question the Theosophical statement. But in answer to this, it may be said, and rightly, that the object does not declare that there is no unbrotherliness in nature but merely that there is brotherhood as a fact and not as a mere sentiment. The fact that we find many instances in nature wherein brotherliness is not observed does not prove that brotherhood is not the real rule of life; while the fact that pain always follows unbrotherliness indicates that brotherhood is the real law or fact in nature.

It is one of the purposes of Theosophy to call men's attention to the brotherliness of nature, more especially for the following reason. Recent science has labored to show that the rule in nature is violence and selfish emulation and that there is no harmony or forbearance in it at all; and from this alleged fact they have attempted to deduce a law of conduct for humanity and to represent unbrotherliness and emulation as being the great law of life for all creation, including man. Looking at this matter from the other side, we may say that materialism and selfishness in life have caused men to see in nature nothing but the repellent aspect; whereas, if their own lives were more brotherly and harmonious, they would be able to discern the harmony and beneficence that prevail in nature.

The aim of Theosophy, then, is to combat this horrible materialism and pessimism in science, which is linked up so closely with materialism and pessimism in life. There have been many close and intimate observers of nature who tell a very different tale from

some of the scientists, and who see everywhere the harmony and beneficence. We cannot expect to come to an understanding of the subject unless we put aside all mere juggling with words. One organism dies and another takes its place. Jones points to this as an instance of self-sacrifice on the part of the one that dies; Smith denounces it as an instance of selfish rapacity on the part of the one that lives. Animals protect their own flock by persecuting intruders; this may be viewed either way, according to the point of view. Again, what of Brotherhood in the crucible or test-tube? Is it unbrotherly for sulphuric acid to attack soda? Is it any use preaching Theosophy to a keg of gunpowder?

The word "nature" needs a little defining. It does not necessarily mean pigs or potatoes. No doubt there is brotherhood of a kind in pigs and potatoes; but is man to imitate these humble creatures? What would be excellent brotherhood in a potato might not be brotherhood in a man. It is right for a potato to behave like a potato, but it is not necessarily right for a man to behave like a potato. In fact, nature includes the high as well as the lowly; man is himself a part of nature. And it is his duty to recognize the part he is expected to play in nature and to live up to it and not try to copy creatures below himself. If he find unbrotherliness, or what seems to him such, in nature, he is not to copy it; but he is to seek for the brotherliness in nature and promote that.

This brings us to a most important point. Man is the most potent creative and molding power in nature. To his neglect of duty and his shortcomings is due much of the ugliness among creatures. For, even where animals do not directly copy him, their soul-life is fed from man's cast-off psychic elements. With man occupying such a place of power, by reason of the intense dynamic influence of his free will and intelligence, it would be ridiculous to expect humble nature to do otherwise than reflect man's conditions. Dogs may become corrupted or refined according to the character of the men they associate with. Are we to say, then, that uncleanness is a law of Nature. Should we not rather strive to prove by our conduct that it is not. And perhaps, if men were what they ought to be, dogs would not be so selfish and cruel.

In conclusion, Theosophy places upon us the duty and responsibility that we should strive by our conduct to prove that brotherhood is a law in nature. The existence of the exceptions, the violations of this law, merely confirms the fact of the law itself. By our example we should endeavor to demonstrate that brotherhood will create harmony all around, thus proving itself to be the true law of life, in nature and in man. E.

Evolution

WE all know the primary meaning of evolution as "an unfolding; a development," but if we turn to our dictionaries we also find an *evolutionist* described as "one skilled in military movements"; and *evolution* as "the movements of troops, etc., in changing their positions for attack or defense."

To my mind, evolution, as applied to man in the Theosophical sense, is a combination of these meanings, for undoubtedly man needs

to be "one skilled in military movements," if he would succeed in the battle of the ages. Evolution is in no sense a *passive* performance in the teachings of Theosophy, but the deliberate work of a self-conscious entity, the Thinker or mind in man: that part of us which reincarnates, the *Warrior-Self*. In the process of unfoldment many are the foes we meet to overthrow, and constant fighting must be maintained by the successful evolutionist.

William Q. Judge, that great Teacher of practical Theosophy, once said that "love and trust" were the only weapons by which the true Theosophist could hope to defeat the enemies of human progress and in the battle we soon learn that this is so. For why? Does not anything lesser belong to the plane of mortality? — but love and trust are immortal weapons, gifts from the gods.

The passions, desires and ambitions of the personal life are ranged in battle array betwixt us and a *conscious unity with our divinity*. How shall we scatter these encroaching hosts; what are the opposing forces at our command? The opposites if we are good evolutionists. They are the neutralizers, winning us final freedom. The opposite of hate, is love; the opposite of greed, generosity; the opposite of desire, altruism; of selfishness, self-sacrifice. Putting these forces forward at the right time we assault and conquer point by point, and thus each tomorrow finds us farther than today, towards our goal of human perfectibility.

It will take trust in ourselves as divine in origin to do this, and trust in the great law of absolute justice, else our steps will falter; and love for humanity as the expression, in heart, of divinity, else our heart will fail. Then let us remember too, that *unfoldment* means *growth*, and that darkness and foundation-work lie at the base of all lasting structures of things animate or inanimate. Let us gird on our armor and go forward serenely to the fray from which no living being can escape. W.

CAST into this life, as it were into an alembic, where, after a previous existence which we have forgotten, we are condemned to be remade, renewed, tempered by suffering, by strife, by passion, by doubt, by disease, by death. All these evils we endure for our good, for our purification, and so to speak, to make us perfect. From age to age, from race to race, we accomplish a tardy progress, tardy but certain, an advance of which, in spite of all the sceptics say, the proofs are manifest. If all the imperfections of our being and all the woes of our estate drive at discouraging and terrifying us, on the other hand, all the more perfect faculties, which have been bestowed on us that we might seek after perfection, do make for our salvation, and deliver us from fear, misery and even death. Yea, a divine instinct that always grows in light and in strength helps us to comprehend that nothing in the whole world wholly dies, and that we only vanish from the things that lie about us in our earthly life, to reappear among conditions more favorable to our eternal growth in good.—*Georges Sand*

THE root of all evil conduct towards God, towards other men, or towards oneself is self-love, self-love so strong as to sacrifice everything rather than its own indulgence.—*William Q. Judge*

THEOSOPHICAL FORUM

Conducted by J. H. Fussell

Question I receive a great many scientific journals and have noticed how the latest theories tend toward Theosophical views. I have read Darwin's *Descent of Man* lately, and conversing with a friend regarding the ideas set forth there, I stated that I believed Mr. Darwin was correct, but that he considered only the physical body. Will you please tell me whether I was correct, or rather, am correct, as I still have that opinion.

Answer The tendency of recent scientific speculation is undoubtedly in the Theosophical direction, as we have frequently pointed out in these pages. Yet we must not be too sanguine that orthodox scientists are going to accept the real principles of Theosophy, with its spiritual basis, all at once, for they are still looking for the answers to their problems where they will never be found in their completeness: i.e., on the physical plane.

H. P. Blavatsky treats in great detail of the highly important subject of evolution in *The Secret Doctrine* and other works, though she is careful to insist that her statements are more of the nature of illuminating hints for students, and pertinent criticisms, than formal teachings. Enough has been made clear in that remarkable book to enable even a beginner to picture the broad outline of human and cosmic evolution, though most of its information is framed in such a way as to oblige the student to use his utmost diligence and intuition to grasp the deeper significance.

According to the ancient Wisdom-Religion (Theosophy), evolution is a far more complex thing than most biologists have suspected, notwithstanding their praiseworthy and industrious researches into cell-development and the growth and distribution of living things, for most of them see nothing in the processes of life but the mechanical interaction of chemical and physical forces, though they admit complete ignorance of the real nature of those forces. Theosophy, on the contrary, regards the laws of matter discovered by modern science as the working tools of an intelligent spiritual consciousness, definitely aiming toward the elevation of every atom to self-consciousness.

The weakness of the materialistic position lies in its negation of and refusal to investigate the existence of intelligent spiritual forces behind evolutionary processes. It has an unreasoning dread of the teleological explanation, thinking that it tends to superstition. Theosophy never suggests that there is any "supernatural" interference with the action of the known forces, nor lawless and arbitrary "miracle," but it asserts that the laws of the universe contain, as the most important factor, the element of intelligent spiritual Guidance, and that blind chance is not the ruler.

Darwinism, by claiming that the Natural Selection of fortuitous varieties is the "motive power" behind all evolution, attempts to make the less include the greater. Notwithstanding innumerable incompatible attempts neither the old nor the new Darwinism has given any demonstrable or admitted explanation of the origin of the variations "selected" (curious misnomer) by the action of blind forces, as Haeckel tells us.

Theosophy supports the *one definite fact*

that biology has clearly established, i.e., that Natural Selection acts as a deterrent, preventing the multiplication of the unfit. This is really a proposition in mathematics, but Darwin deserves the greatest credit and respect for his brilliant demonstration of it.

Without the reincarnating "Monad" or higher spiritual self of Theosophy, the evolution problem is an equation with the chief factor omitted from one side. It is no wonder that the well-known gaps in the Darwinian scheme are showing no evidence of being filled up. These include the great hiatus between man and the ape, that between the placental and non-placental animals (recently found to be much greater than hitherto believed because the marsupials must now be classed with the placentals), the unknown—and perhaps non-existent—series of links between the vertebrates and the invertebrates, and many minor vacancies. Theosophy shows that the absence of many links is perfectly to be expected, for a considerable part of the evolutionary process took place upon more subtle planes of existence than the physical, relics of which we cannot expect to find in the rocks. They must be looked for in other directions.

From these inner planes, where the permanent "Monad" was experiencing a more ethereal and semi-substantial course of evolution, thought-forms or semi-spiritual centers of attraction—forms or molds into which the nature-forces could build material atoms as developing life on earth required more and more complex vehicles—were thrown off by the Higher Self of Man which was coming down to the condition when it would need physical embodiment. These model forms gave the general outlines for the root-types which, helped and hindered by the processes of Natural Selection, Survival of the Fittest, Geographical Isolation, and Climatic influences, multiplied into the well-known varieties. The formation of the subordinate species has been as much a horizontal process, so to speak, as a vertical one (in time). A rapid branching and interweaving took place after the appearance of the general root-types, as we see in the early fishes, the trilobites, the reptilians, and finally in the mammals and man. In some cases connecting-links have not developed between diverse roots, and then we have a big gap in the fossil or living record.

Man was no exception. The ideal form and character of his physical frame, the most perfect type towards which evolution has always been tending, was projected into objectivity under the pressure of the inner evolution of the Higher Ego which was getting ready for the experience of material life. H. P. Blavatsky and William Q. Judge were very reticent as to the details of the molding of the physical body and its preparation for the incoming tenant, the real man, but the former gives a few very important hints in *The Secret Doctrine*, which are quoted in the Theosophical Manual No. 18, in the sixth chapter. Manuals 17 and 18 give inquirers plenty of food for thought upon the general development of man according to the teachings of Theosophy, which are not speculative.

The point of most importance in studying evolution from the standpoint of Theosophy is that there is a Self that evolves and that needs vehicles of different densities and qualities to bring it into contact with the many interpen-

etrating and various planes of nature. This higher Self has emanated many such links with the lower planes; and so we say that there are more lines of evolution than the material.

In answer to the possible objection that we possess no memory of previous existence on other planes, and that there has been nothing but the physical for us, we must try to comprehend that the status and powers of the Reincarnating Ego are not those of the personality, the ordinary brain-mind and emotions, but are much higher. Recent observations by psychologists of the newer schools, such as the late Dr. T. J. Hudson, have reaffirmed the ancient belief that there is a transcendental self of *some kind* in man. Theosophy shows us that the part of our mental make-up which these researchers into the mysterious realm within have found, is only a portion or division of the *lower* man, though it possesses powers and senses of which the brain-mind in ordinary use is destitute. The real Higher Ego is a godlike being, immortal, "for whom the hour shall never strike," possessing the memory of the past and knowing where its evolution leads. Its association with the lower mind, its reflection or emanation, is one of the most profoundly interesting and difficult subjects with which Theosophy deals. As we purify our lower nature we shall win our immortality by uniting with this, the "Father in heaven."

A study of Professor V. Kellogg's new book *Darwinism Today* will give to those who wish to know the exact position of modern biologists upon the subject many surprises. He sums up the result of the past fifty years of discussion of and research into evolution with the candid admission that science is no nearer the cause of the variations which Natural Selection deals with. After a most exhaustive examination of every theory that has been advanced to explain the difficulties in the mechanical theories he frankly admits he does not know, and says:

Nor in the present state of our knowledge does anyone know, nor will anyone know until, as Brooks says of another problem, we find out. We are ignorant; terribly, immensely ignorant. . . . To question life by new methods, from new angles, on closer terms, under more precise conditions of control; this is the requirement and the opportunity of the biologist of today. May his generation hear some whisper from the Sphinx!

He also quotes H. F. Osborn approvingly:

"The first step then towards progress is the straightforward confession of the limits of our knowledge and of our present failure to base either Lamarckism or neo-Darwinism as universal principles upon induction. . . . The third step is to recognize that there may be an unknown factor or factors which will cause quite as great surprise as Darwin's. . . . The general conclusion we reach from a survey of the whole field is, that for Buffon's and Lamarck's factors we have no theory of heredity, while the original Darwin factor, or neo-Darwinism, offers an inadequate explanation of evolution. If acquired characteristics are transmitted, there must be, therefore, some unknown principle in heredity; if they are not transmitted, there must be some unknown factor in evolution."

There is another factor now declared, and the Sphinx has spoken the word which is sufficient to open the desired door to all who dare to throw aside their prejudices and personal preconceptions and to seek for truth in the true spirit of scientific research. R. J. C.

THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS
REORGANIZED IN 1898 BY KATHERINE TINGLEY

Central Office Point Loma California

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

Reincarnation and the Criminal

IN the course of some remarks on the subject that criminals should be reformed rather than punished, and regarded with pity rather than hate, a clergyman is reported to have said that:

The sciences of biology and sociology must see that he is saved from the maturing of the seeds which he himself has not planted. . . . The criminal is a living petrification of a previous stage of development when what is his vice now would have been his virtue then. He is not responsible for having been born now rather than then.

If the reason for treating the criminal kindly is that he is not responsible for his criminality, then the inference would seem to be that if he were responsible, we ought not to treat him kindly. But we ought to treat him kindly in either case; our duty remains the same, whether he is responsible or not. The troubles of our fellows demand our help, no matter how they were incurred.

Further, is it true that the criminal is irresponsible? Is it true that he did not plant the crop he is reaping? The saying that whatsoever a man sows that shall he also reap, has its complement in the saying that what a man reaps that has he also sown. But the eye of modern thought does not penetrate beyond the veil of birth.

According to the view of life presented by this speaker, it would seem as though cosmic law were strangely unjust and chaotic; and as though man, himself a product of this chaotic law, had with equal strangeness acquired the duty of rectifying the defects of the law which called him into being. If the criminal was thus ruthlessly and recklessly flung into the world by the careless hand of Nature, then so was the would-be reformer, for he also is a man; and we have the spectacle of one piece of driftwood coming to the aid of another. But perhaps the clergyman would be ready to allege that there are two classes of humanity, one responsible, the other irresponsible. Such a doctrine, however, would involve consequences that one feels sure he would not stand for, and would raise the question of whether it is any use attempting to reform the criminal at all.

The truth is that it is impossible to get a coherent theory of the case unless we begin by postulating the *pre-existence* of the Soul. Without this, we get the untenable idea of

MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.
